The dissolvability of Ibuprofen was dictated by the harmony dissolvability technique in which a soaked arrangement of the material was gotten by blending an overabundance of medication in a steady amount of dissolvable until immersion or balance was accomplished in a vortex blender. Then, at that point it was separated through Whatman channel paper (no.1) and focus was investigated by UV spectrophotometer at 222 nm. The dissolvability of not really set in stone in refined water and pH across the gastrointestinal plot, for example in pH 1.2, 6.8, and 7.4.

DifferentialScanningCalorimetry(DSC)

Thedifferentialscanningcalorimetry(DSC)ofpuredrugs,soliddispersion,andthephysicalmixtureoftheremedy wasperformedusingDSCinstrument (Perkin Elmer Pyris 6 DSC, Germany), for the measurement of heatloss or gain resulting from physical or compound changes inside the example as a component of temperature. Around 6-7 mg of the example was made an appearance aluminum DSC container and hermetically sealed with aluminium lids. An underlying incline was utilized to hop the temperature to 30ºC and afterward a steady warming pace of 10ºC/min was utilized something like 400ºC under nitrogen temperature.

FourierTransformInfrared(FTIR)studies

The similarity of medications and excipients utilized under trial condition were contemplated. The examining range was 400 to 4000 cm-1 and the goal was 1cm-1. This unearthly examination was utilized to check the similarity of medications with the excipients utilized and put away.

Powder X-ray diffraction

Powder X-beam diffraction studies were performed to check for any crystallinity in the definition after it was made and after the strength studies were performed. Staying away from recrystallization of the medication in the definition was one of the objectives of the current investigation. Skillet logical X-Pert Pro V1.6 with X Pert Data Collector V2.1 programming was utilized furnished with a CuKa2 anode cylinder and diffractometer of span 240 mm. The X-beam powder diffraction check was performed utilizing a BB004 level stage. The powdered example was put in an aluminum test holder that had a 2.5 cm square with a profundity of 0.5 mm. The information were gathered by filtering the example at 45 kV and 40 mA. Tests were filtered from 5 to 50°C 2θ at a stage size of 0.0170 and output pace of 1.0°C/min.

FormulationDevelopment

PreparationSoliddispersionofIbuprofen

Preparation of solid dispersions of Ibuprofen is to improve the solubility ofIbuprofen and dissolution rate. Solid dispersion of Ibuprofen was prepared byhot melt method. The drug and carrier were mixed in 1:1, 1:2 and 1:3ratios in ethanol. Solventwas removedby evaporation under reduced pressureThe mass was crushed and gone through strainer no 60

PreparationofphysicalmixturecontainingIbuprofen

Thecorporeal assortments of Ibuprofen-guar gum and Ibuprofen Aminated guar gum in the identicalheft ratio (1:3) were primed by scrupulously mixingthe appropriate amount of two components for 10 min in a mortar. The concoctionsweresievedthrougha60meshscreenandstoredinadesiccatorforfurtherevaluation.Solid dispersions were prepared by hot melt method. Correspondingphysical mixtures were heated in an oil bath at 175^{0}Cuntil they melted.

S.D6	Ibuprofen:guar gum	1:3

EvaluationofIbuprofensoliddispersionsandcorporeal mixtures
Evaluationstudieswerecarriedoutbyestimatingdrug contentand*invitro*dissolutionstudies.

Determination of solubility of various solid dispersions
Ibuprofen laden strong scatterings, actual combinations, and unadulterated Ibuprofen identical to 30 mg were gauged and moved to four cups containing 50 mL of refined water, pH 1.2 acetic acid derivation cushion, phosphate support pH 6.8, and phosphate cradle pH 7.4. The example was fomented at 80 rpm in a thermostated shaking water shower at 37±0.5°C for 8 h. The supernatant arrangement was then sifted through Whatman channel paper. The filtrate was weakened and the absorbance was estimated utilizing an UV-Vis spectrophotometer.

Drugcontent
The drug content of each solid dispersion physical mixture weredetermined by UV-spectrophotometry. Accurately weighed quantity of samplesfrom all batches equivalent to 100 mg of Ibuprofen was transferred to a 100mlvolumetric flask containing 100ml of phosphate buffer pH 7.4 and the absorbancewasmeasured at 222nm.

Invitrodissolutionstudies
Thepreparedsoliddispersionswereaccuratelyweightequivalentto100mgofthedrug.Thesesoliddispersionsarefilledinemptycapsulesand analysed for drug release in 900ml of phosphate buffer pH (7.4) as dissolutionmedium at 37± 0.5ºC and 50rpm. 5ml of the sample solution was taken from thedissolutionapparatusandthesamevolumereplacedwithfreshdissolutionmediumatpredeterminedtimeintervalsfor5min.Theabsorbanceofthesesolutionswasmeasuredat 222nmusingUV-Visiblespectrophotometer.

Stabilitystudies
Stability study was carried out to observe the effect of temperature andrelative humidity on selected formulation (SD3), by keeping at 40±2ºC, in air tighthighdensitypolyethylenebottlesforsixmonths,atRH75±5%.Physicalevaluationwascarried out ineach month.[9]

Table2:- ICHguidelinesforStabilitystudy.

Study	Storagecondition	Timeperiod

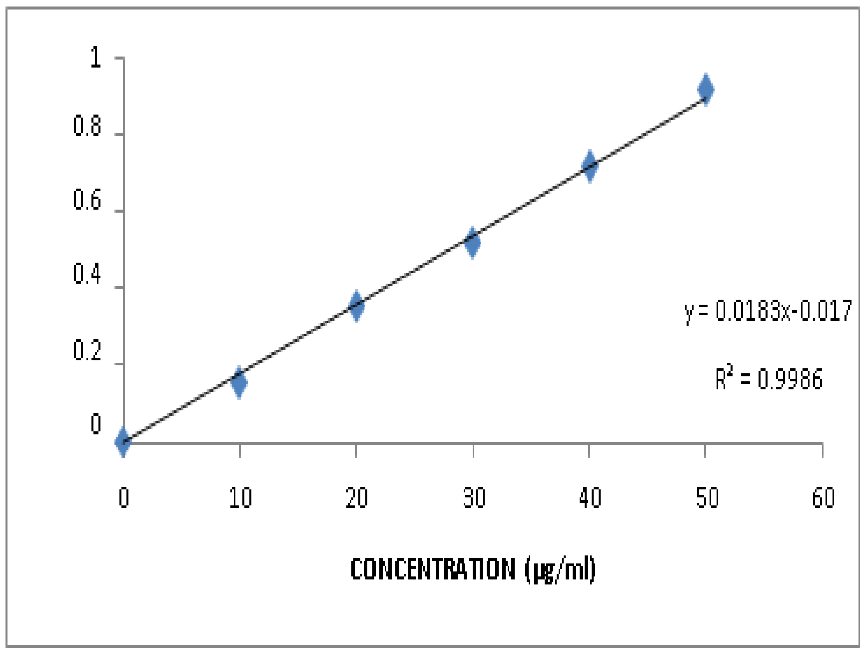

Figure 2:- Calibrationcurveofibuprofen.

The calibration curves were linear and obeyed Beer-Lambert's law in theconcentration range 10-50µg/ml. The correlation coefficient values were 0.9986indicatingexcellent linearityof thedata.

Appearance

Ibuprofenappeared as crystalline solid.

Melting point

Melting point of drug was determined by capillary method. The result is found to be 75-77^{0}C.

Saturation solubility

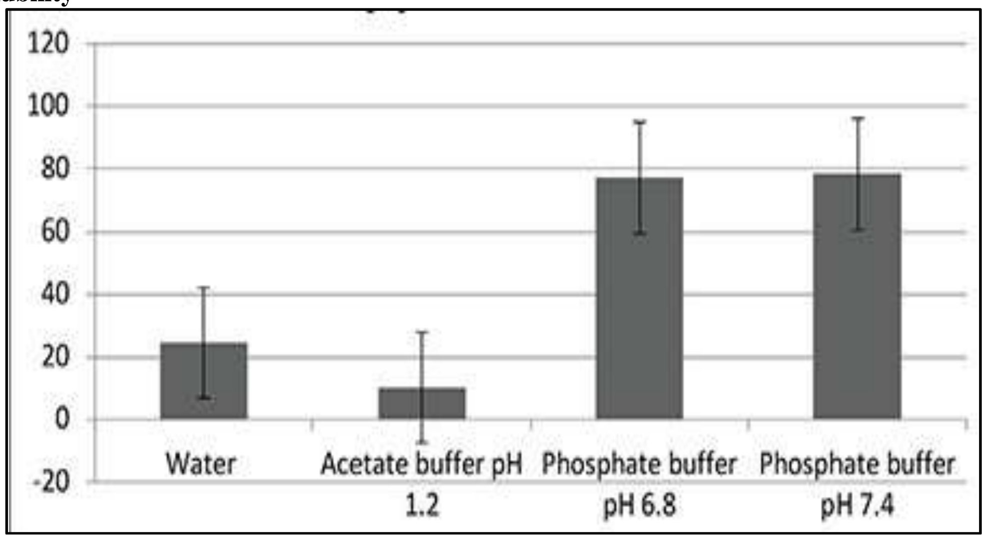

Figure 3:- Graphical representation of Solubility data of Ibuprofen in different solvents.

The solubility data of Ibuprofen in distilled water, Acetate buffer pH 1.2, phosphate buffer pH 6.8, and phosphate buffer pH 7.4 at 25°C are given in Table 11. The comparison of Ibuprofen in different solvents is presented graphically in Figure 15. From the Results we can conclude that the drug is poorly soluble in nature. So is suitable for the formulation of Solid disperssion toenhance itssolubility.

CompatibilityStudies
DifferentialScanningCalorimetry(DSC)

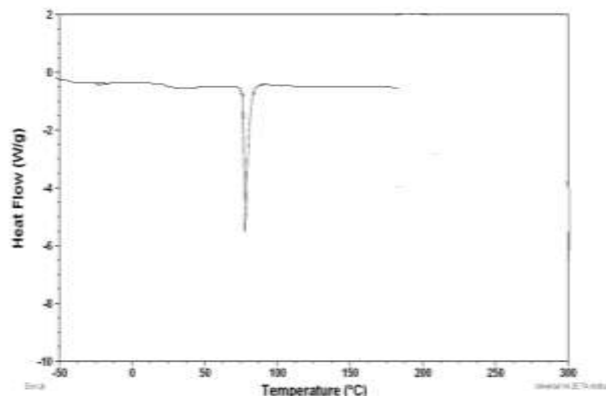

Figure4:-DifferentialScanningCalorimetryofIbuprofen

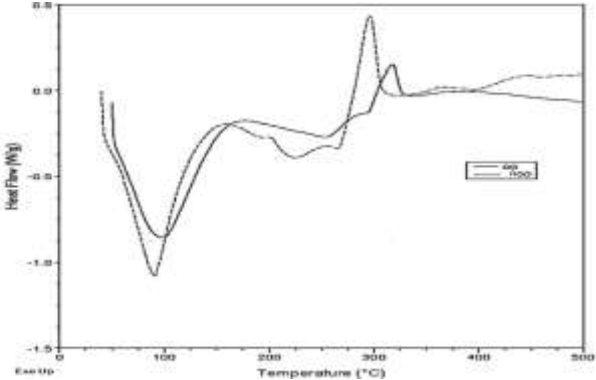

Figure5:-DifferentialScanningCalorimetryofGuar gum(GG) and Aminated guar gum(AGG).

The DSC thermogram of pure Ibuprofen showed a sharp endothermic peakat 100.00°C which corresponds to its melting point.Observation revealed that the drug is pure without any impurities.SC thermogram shows the thermal behavior of native and aminated guar gum. For native guar gum, endothermic peaks were detected at 253 and 296 ◦C, and exothermic peak was detected at 317 ◦C. Aminated guar gum showed endothermic peaks at 223 and 274 ◦C, and exothermic peak at 295 ◦C. All endothermic and exothermic peaks for both guar gum samples are shown in the above figure.

Fourier TransformInfraredStudies
The FTIR Spectra of Ibuprofen in pure form and theirphysical mixturewas observed, the result showed that there is no interaction between drug andpolymers. From the FTIR spectral Figures 6 to 10 Interpretations the followingresult was obtained. The FTIR of Ibuprofen and combinations of polymers showsintense bandin thetable7 to 10asfollows.

relative powers between thecurves a and b in the range of 17 < 2Ɵ < 21 is probably related to the difference in distribution of crystallographic orientations in the microsized original powder and Solid disperssion.

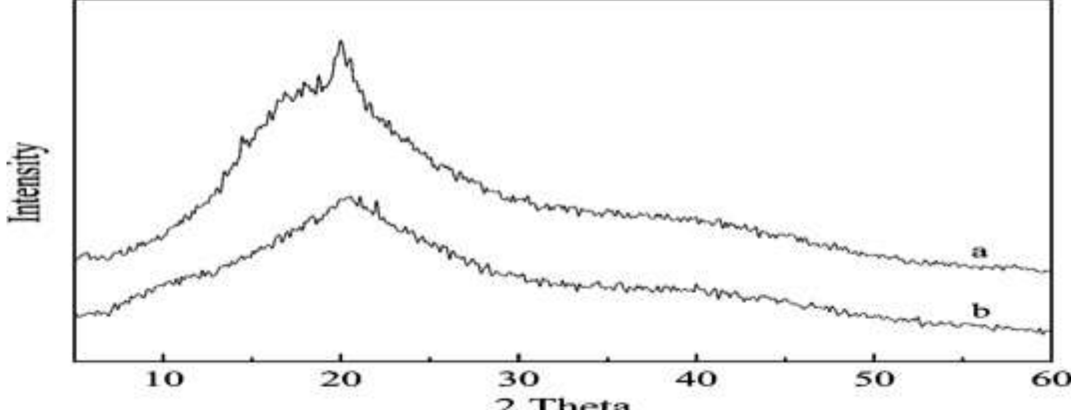

Figure 11:-XRD pattern of GG (a) and a representative AGG

The wide point X-beam diffractogram of local guar gum and an agent Aminated guar gum is introduced in Fig. 10. From Fig.10a, clearly local guar gum displays a tiny crystallinity. Comparable appearance has been accounted for local guar gum in the writing (Pal, Mal, and Singh, 2007). After Amination, an articulated decrease in crystallinity is noticed (Fig. 10b). This misfortune in crystallinity could be credited with the impact of the substitution of the Amine bunches by the Amination cycle. Amine bonds keep up with the dependability of guar gum gem, when they are broken, it could prompt diminishing the crystallinity.The drug content of each solid dispersion batch and physical mixture weredetermined byUV-spectrophotometrymeasured at 222nm.

Table 4:- Drug content of evaluation of solid dispersion containing Drug andCarriersfor various formulations.

u) SD4	v) 25±0.66	w) 56±0.97	x) 84±0.83	y) 88±0.83
z) SD5	aa)28±0.66	bb)64±0.24	cc) 104±0.28	dd)125±0.46
ee) SD6	ff) 42±0.61	gg)70±0.56	hh)82±0.38	ii) 196±0.84
jj) Pure Ibuprofen	kk) 20±0.49	ll) 10±0.86	mm)30±0.62	nn)42±0.24

As related to pure drug and, the solid dispersions prepared by Hot Melting Method showed higher solubility in Solid dispersions with Aminated Guar gum than the Solid Dispersions with Native Guar gum (Figure 12). The current examination proposed that this may be conceivable because of the planning of strong scatterings utilizing fluctuating convergences of normal transporters, which framed an eutectic combination and expanded the wettability of Ibuprofen and thus its solvency.

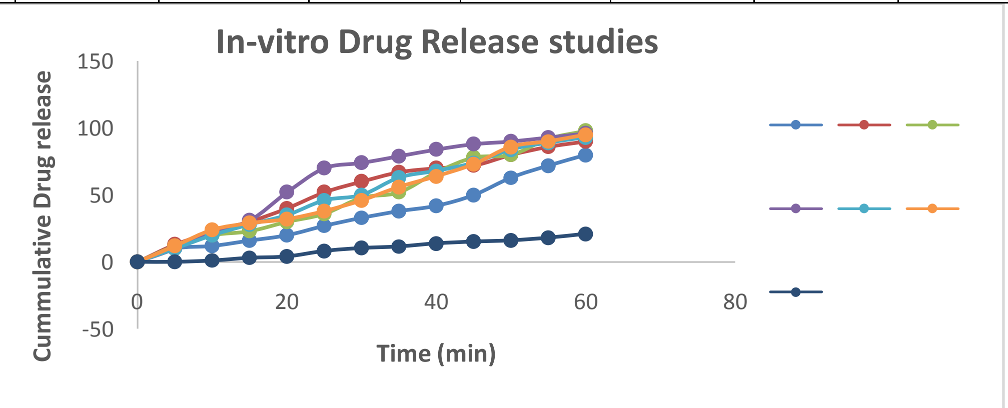

Figure 13:-In vitro drug release study of solid dispersion containing Drug and Carrier for various formulations

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

ThesoliddispersionofS.D3 batchshowedmaximumdrugcontent[99±0.83] and drug release [98%] and pure drug solution showed the most low release about 20% within 60 minutes, among all the formulationsand this ratio can be used to augment the solubility and dissolution rate of poorlywater soluble drug Ibuprofen. It was observed that the drug release was increasedwith increasingthequantityof Aminated Guar gum.

StabilityStudy

After storage the formulation was analysed for various parameters, resultsare showed in Table7.

Table 7:- StabilitystudyofbestformulationSD3.

Characteristic	Initial	10days	20 days	30 days	45 days
Appearance	White	Nochange	Nochange	Nochange	Nochange
Texture	Smooth	Smooth	Smooth	Smooth	Smooth
Drugcontent(%)	99.80±0.48	99.5±0.45	99.04±0.62	98.89±0.45	98.79±0.54
%of Drugrelease	97.41 ±0.16	97.23±0.34	96.45±0.22	96.24±0.43	96.01±0.42

Allthe values are expressedasmean±SD,n=3

From the table 7, there was no visible changes in the appearance of theformulation SD3and the drug content and dissolution profile of the optimizedformulationwasrelatedto theinitial reference.

Conclusion:-

The purpose of theexisting study was developed solid dispersion of NSAIDS like Ibuprofen by using functionalized guar gum. The results of FTIR study andDSC study confirmed that there is no chemical interaction or no incompatibilityamid the drug and excipients. The solid dispersion technique using Aminated guar gum would be aneffectiveapproachforincreasingthesolubilityandincreasingdissolutionbehaviourofpoorlywatersolubledrug than the native Guargum.

The *in vitro* dissolution study was performed for the prepared formulations. Based on the results SD3 was shown highest drug release99.41%within24hrs.

StabilitystudywasconductedasperICHguidelinesandtheresultsshowedthat there isno physicalor chemical change.

It may be concluded that the Solubility of Drugs Can be improved by using Funtionalized Guar gum in the Solid Dispersion, which provides a wide scope for the therapeutic efficiency.

Acknowledgement:-

RESEARCH ARTICLE

Good Documentation Practices: A Need of Pharmaceutical Industry

Mr. Pravin D. Kolekar*, Prof. Avinash Mahadeo Bhagwat
Department of Pharmacy, Yashoda Technical Campus, Satara, 415015 India.
*Corresponding Author E-mail: **pravin86003@gmail.com**

ABSTRACT:
Good Documentation Practice (GDP) is a term used in the pharmaceutical industry. Good Documentation is an integral part of good manufacturing practices. it is essential for the integrity of data collection and reporting for supporting development, registrations, commercialization, and life-cycle management of pharmaceutical products. Documents are a mirror to show actual image of any pharmaceutical Industry. Such measures that collectively and individually ensure documentation, whether paper or electronic, is attributable, legible, traceable, permanent, contemporaneously recorded, original and accurate.

KEYWORDS: Good Documentation Practice, Pharmaceutical industry, Paper Document, Electronic Document.

INTRODUCTION:

The GDP can be defined as "Good documentation practice is an essential part of the quality assurance and such, related to all aspects of GMP" this definition is based on WHO. Good Documentation Practices (GDP) are methods for recording, correcting and managing data, documents and records, to ensure the reliability and integrity of information and data throughout all aspects of a product's lifecycle. Clearly written documents prevent errors of various activities in pharma each and every activity is written in specific documents such as SOPs and strictly followed. Verbal communications may be the create errors andthere was no proof. So, to minimize error by good document practice that all important documents such as Master formula record, procedure and record must be free from errors and documented.

1. Type of formulation
2. Country requirements
3. Availability of ERP or SAP system.[1]

The U.S. Food and Drug Administration (FDA) Set Some GDP Standards, others fall under the Current Good Manufacturing Practice (CGMP). All pharmaceutical, bioscience andhealthcare companies, as well as their vendor partners, must observe GDP or face warnings or penalties levied by the FDA. According to the World Health Organization (WHO), The purposes of GDP are:

1. To define the specifications and procedures for all materials and methods ofmanufacture and control.
2. To ensure that all personnel concerned with manufacturing know what to do andwhen to do it.
3. To ensure that authorized persons have all the information necessary to decide whether or not to release A batch of A drug For Sale.
4. To ensure the existence of documented evidence, traceability and to provide recordsand an audit trail that will permit investigation.
5. To ensure the availability of the data needed for validation, review and statisticalanalysis.

Documentation is also key to GMP compliance for it ensures traceability of all development, manufacturing, and testing activities. Documentation provides the route for auditors to assess the overall quality of operations within a company and the final product (3). For example, with the FDA Code of Federal Regulations (CFR), 21CFR 211.180(e), records and reports, states: "written records…shall be maintained so that data therein can be used for evaluating…the quality standards of each drug product…". This extract thereby links the importance of good documentation to GMP. This paper presents an overview of good documentation practices applicable to those working in the pharmaceutical and healthcare sectors. Specific topics for discussion include the following:

1. Good manufacturing practice and documentation including errors and error correction
2. Document fundamentals
3. Document creation
4. Document management
5. Types of documents
6. Best practices for document creation, including style and layout
7. Completing documents and record-keeping
8. Electronic records
9. Document storage [2]

Objectives:

1. Establish, control, monitor and record all activities, which directly or indirectly impact on all aspects of the quality of medicinal products.
2. Appropriate good documentation practice should be applied with respect to the typeof document
3. Ensure that the document should maintained accuracy, integrity, availability and legibility during the document life cycle.
4. Document should be free from error and during any point of if error identify then rectify with proper reason for correcting including sign and date.
5. The Term "Written" in any document means recorded/document on media from which data may be rendered in a human readable form.
6. Site Master File: A document describing the GMP related activities of themanufacturer.[3]

Importance of Documentations:

As per GMP documentation control "If it not written down, then it did not happen" The document provides information on when, where, who, why and how to complete the task. The document provides evidence proving that the tasks have been completed as they should be. 4

Scope:

The Good documentation practices are target to both paper as well as electronic data or manually filled records or generated electronically in a GDP environment.[5]

Basics of Documentations:

To meet industry standards, it is critical that all documentation follows GDP when it affects:

1. GMP processes
2. Material or product identity, quality, purity, strength and safety
3. The validated state of GMP product manufacture, facilities, equipment, computer systems and testing methods.

It is recommended that your company has a policy or procedure outlining the expected GDP standards, particularly for those requirements that may be unique to your company – for example, using a specific pen color or when and how to use scanned documents/records as original data. [6]

Purposes:

1. To provide the basic guide for good document practices with regard to creation, approval, review, maintenance, correction or errors, verification and archiving etc.
2. To define the specifications and procedures for all materials and methods ofmanufacture and control.
3. To ensure the existence of documented evidence, traceability and to provide records and an audit trail that will permit investigation.
4. Ensures availability of data for validation, review and statistical analysis.
5. To ensure that all personnel concerned with manufacturing know what to do andwhen to do it.
6. To improve performance.
7. Regulatory requirements. [7]

Key Quality and Regulated Documents:

1. **Concise:**
   Present information clearly so it can be easily understood with no room for misinterpretation. For example, the date format "05/06/12" can cause confusion. Use one that is unambiguous, such as "05 Jun 2012."

2. **Legible:**
   Information should be readable and leave no room for error (for example, hand-written data that are not legible may cloud data analysis or result in "Missing Data").

3. **Accurate:**
   Documentation should be error-free—properly reviewed, verified and approved. Information should be recorded as an event happens and not after the fact, so as to avoid recording "What You Remember" rather than "What Actually Happened."

6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

4. **Traceable:**
   Documentation should be traceable. make it clear who logged the information, what it was, and when and why it was documented.

Do's and Don'ts with Document:

1. Use black or blue permanent, indelible ink.
2. Make clear, complete and legible entries.
3. Make an entry when an event happens (Not Later).
4. Make corrections that are legible and traceable. for example, when a correction is required, put a line through the error, make the correction next to the error, include an explanation (If it is not self-explanatory), and initial and date the correction.
5. If it is not appropriate to fill in a space in a document (Such as an empty page), enter "N/A," your initials and the date so that no further information can be added later.
6. Follow established standard operating procedures (Sops)—for example, document review and approval processes, version control, and date and time formats, as well as record retention, change control, electronic signature (If applicable) and so on.
7. Provide training to everyone in company.
8. Do not use pencils or erasable ink.
9. Do not use "Write-Out" or any masking devices.
10. Do not make corrections that are not traceable (For example, overwriting entries with no date, initial or explanation).
11. Do not use "Sticky" notes.
12. Do not back-date or post-date.
13. Do not use ditto marks.
14. Do not use asterisks that may cause confusion (Such as using the same asterisk for different footnotes).
15. Do not transcribe data.
16. Do not use unbound laboratory notebooks without page numbers (That is, avoid any doubt concerning missing pages).[8]

Types of Documentations:

Documentation refers to both printed forms and electronic systems. Broadly speaking, documentation types can be classified as:

1. Specifications
2. Manufacturing and packaging instructions
3. Standard operating procedures
4. Records.

More specifically, the various types of documents found within a typical pharmaceutical organization include:

1. Technical agreements
2. Confidentiality agreements
3. Technical reports
4. Quality system related documents
5. Quality Manual
6. SOP's
7. Validation protocols and reports
8. Deviation reports
9. Audit plans
10. Validation master Plans and validation documents including URS, DQ, FAT, IQ, OQ, PQ, and validation reports
11. Test material related documents including product specification, test material receipt,and reports
12. Personnel related documents including training records
13. Facility related documents including floor plans, HVAC plans, and environmentalspecifications
14. Deviation forms including unplanned deviations and system failure investigation
15. Change control
16. Worksheets, notebooks, and logbooks documentation must be clear, free from errors, subject to regular review, and be kept up-to date.[9]

MATERIALS AND METHODS:

Constituents of Good Documentation:

- Approve, review and update documents
- Changes and current revision status of documents identified
- Relevant versions of applicable documents available at points of use
- Documents remain legible and readily identifiable
- Documents of external origin identified, and their distribution controlled
- Prevent unintended use of obsolete documents, and archiving

Principle:

Good documentation constitutes an essential part of the quality assurance system and is key to operating in compliance with GMP requirements. The various types of documents and media used should be fully defined in the manufacturer's Quality Management System. Documentation may exist in a variety of forms, including paper-based, electronic or photographic media. The main objective of the system of documentation utilized must be to establish, control, monitor and record all activities which directly or indirectly impact on all aspects of the quality of medicinal products. The Quality Management System should include sufficient instructional detail to facilitate a common understanding of the requirements, in addition to providing for sufficient recording of the various processes and evaluation of any observations, so that ongoing application of the requirements may be demonstrated. There are two primary types of documentation used to manage and record GMP compliance: instructions (directions, requirements) and

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

records/reports. Appropriate good documentation practice should be applied with respect to the type of document. Suitable controls should be implemented to ensure the accuracy, integrity, availability and legibility of documents. Instruction documents should be free from errors and available in writing. The term 'written' means recorded, or documented on media from which data may be rendered in a human readable form. [10]

Documentations Challenges:
Because of the complexities of record keeping in the pharmaceutical industry, there are inherent challenges that companies face in regard to GDP. Some of the most commonconcerns compliance officers must keep in mind include:

1. Lack of proper record-keeping when documents are transferred from one department or facility to another.
2. Critical oversight regarding document issue, data collection and document review.
3. Consistent labeling which includes identification codes, document revision codes, product identification codes and product lot numbers. [11]

Documents Errors:
Common documentation errors that commonly appear in FDA warning letters and reports from other regulatory authorities include**:**

1. Documentation not contemporaneous
2. Use of ditto marks
3. Use of signature stamp
4. Failure to use ink as specified by procedure
5. Incorrect ink used for entries causing illegible data when a substance was spilled
6. Logbook corrections failed to identify person who made the changes
7. Obscured original data
8. Use of pencil
9. Inaccurate records
10. Sample sequence table and audit trail not documented (to draw on the commonly used phrase: "if it is not documented, it didn't happen")
11. Handwritten changes not dated
12. Write-overs, multiple line-through, and use of "white-out" or other masking device. the most common GMP citation occurs with correction of errors when information is recorded. Correction of documentation errors should include:

A. Draw a single line through the error,
B. Make the correction next to the error,
C. Write an explanation for the error,
D. Sign and date the correction.
E. It is recommended that these common errors are highlighted in training on the creation and use of documentation.[12]

Documents Fundamentals:
There are many different types of documents found within pharmaceutical organizations, each serving a different purpose. Although there are different document types, documents can generally be placed into a small number of categories cascading down the quality system. With the types of documents and some of the errors relating to documentation use, it is useful to consider at this point how documents come together and what the basics of a document are. This is illustrated in Figure 1.

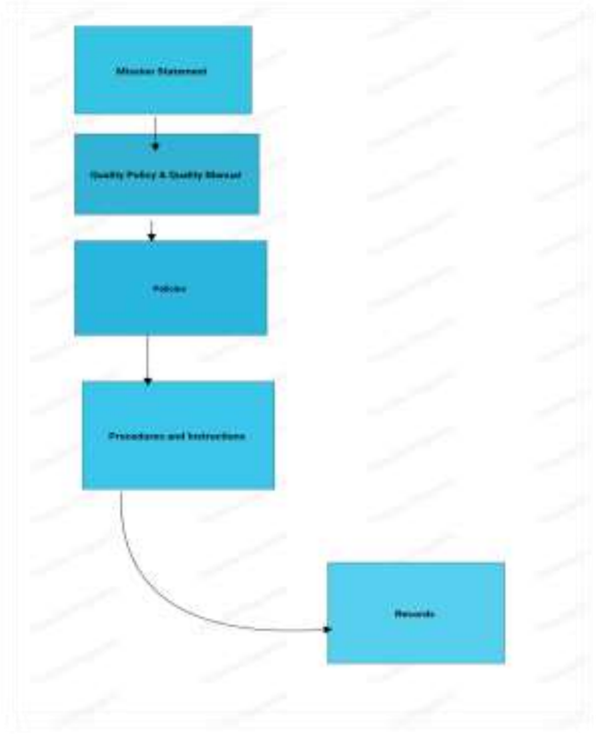

Figure 1. Classic Documentation Hierarchy

The vast majority of documents are procedures or records. The most common examples of a procedure within the pharmaceutical organization are standard operating procedures (SOP). A record is often related to a specific SOP and carries the confirmatory details required of that SOP. For example, the SOP for a sterility test record should require details such as the product name, its batch number, and its test result.

Documents Creation:
The creation of documentation can be conceived very much like a process. In doing so, the first stage can be described as event capture. However, the information or event has no status unless it can be verified or approved, which is the second stage. The last part of the process is to communicate the event, in this context by circulating and implementing the document. To illustrate this, consider a laboratory test common to many microbiology laboratories – the gram stain technique. To

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

document the procedure, we need to write down the steps which capture the process. As part of a controlled system, the steps need to be verified as being correct and the procedure "signed of" (approval stage). The procedure can then be issued in into routine use along with associated training, which is the communication stage.

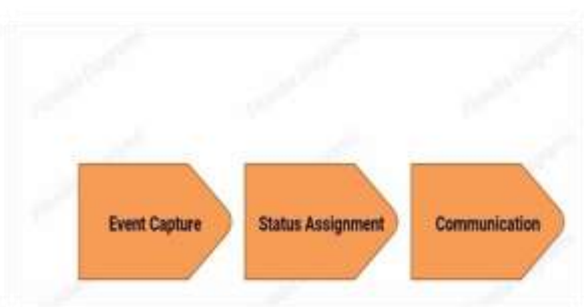

Figure 2. Documentation Flow Path

Documents Control:
Further considerations regarding the system controlling documentation include:
1. Documents should be available at point of use
2. Masters, including electronic versions, are held under control
3. There is control over format
4. There is a system for changes, approval, and re-issue
5. There is control of documents of an external origin.

The majority of these requirements also make up the elements of the "documentation lifecycle"— From document creation, through its use, to its storage and archiving, and then to its eventual retirement and possibly replacement by a revised version. The control of documents necessitates the following steps:

Documents Approval:
Documents must be approved for use. They must be approved, signed, and dated by appropriate authorized personnel.

Handwritten Entries:
1. Adequate space needs to be provided for expected handwritten entries
2. Handwritten entries must be in indelible ink
3. Critical entries must be independently checked (second person verified)
4. No spaces for handwritten entries should be left blank. If unused, they are crossed out or "n/a" (or similar text) entered
5. Ditto marks or continuation lines are not acceptable
6. A stamp in lieu of a handwritten signature is not acceptable.

Documents Copies:
1. Copies need to be clear and legible
2. Errors must not be introduced
3. Documents should be regularly reviewed and kept current,
4. Documents should be retained and readily available for audits
5. Archived documents must be retrievable for the appropriate duration
6. Electronic document management systems must be validated
7. Electronic records must be backed up.

Documents Modification:
1. Handwritten modifications are signed and dated
2. Altered text should not be obscured (e.g., no obliterating the text through crossing-out)
3. Where appropriate, the reason for alteration must be noted (for example, "error." is acommon abbreviated reason, indicating "entry error"),
4. Controls exist to prevent the inadvertent use of superseded documents
5. Electronic versions should only be modified by authorized personnel
6. Access to electronic documents must be controlled by password or other means.

A history (audit trail) must be maintained of changes and deletions to electronic documents. Well-designed documentation and appropriate documentation are paramount. It is necessary to document every aspect of the process, activities, and operations involved with drug and medical device manufacture. If the documentation showing how the product was made and tested (which enables traceability and, in the event of future problems, recall from the market) is not correct and in order, then the product does not meet the required specification and could be considered to be adulterated.[13]

Document Style and Layout:
It is often helpful to adopt a specific document style for consistency of operations. Elements of the style should be specified in an approved procedure. These might include (9):
- Logo
- Pagination/ layout to prevent confusion and ensure the document is kept in order
- Headers and footers
- Font including the size is useful to minimize errors introduced when changingbetween fonts
- Page numbers
- Executive summary
- Changes - Change control is important for traceability
- Circulation list - to ensure the document is reviewed

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

and received by the appropriatepersonnel
- Table of contents
- Authorization levels stated on document
- Cross references
- Revision history
- Definitions
- Content (context and meaning)
- A clear area for recording problems/ incidents
- Use of pictures, flow charts, diagrams as suitable alternatives to text.

Care should be taken in designing and stylizing documentation. Documents must have unambiguous contents. The title, nature, and purpose should be clearly stated. They must be laid out in an orderly fashion. Documents must be easy to check. Reproduced documentsmust be clear and legible. Many people do not consider the importance of how key information is presented within a document. This can result in the reader wasting time or not conducting the correct tasks. For example, a poorly structured document could ask the user to conduct a task that requires some action to be performed prior to the subject task – but only mentions the prework at the end of the document and with no reference to the pre-work at the beginning. Helpful considerations for layouts include the following:
- Cover page with identifiers and status
- Table of contents – creating a road map through the document
- Scope and applicability section
- Introduction
- Information and instructions in a logical sequence
- Additional information and detail.

Numerical information must include the correct use of units. The use of color coding in graphical information, such as black lines for existing pipework and red lines for new pipework, might also be useful. The narrative must consider writing style, nomenclature, and dealing with errors and corrections It is useful to consider different styles to accommodate the different reading styles of readers. There are thought to be three styles based on the linguistic, logical and spatial talents. These can be summarized as (10):
- Linguistic talent. There is a strong ability to write and talk fluently. Phrases like “gift of the gab” often apply. Individuals in this category can also write and read well. Shakespeare had linguistic talent.
- Logical talent. There is strong ability to think logically and are quick in calculating odds and statistics. Albert Einstein had logic talent.
- Spatial talent. There is strong ability to image things in the “mind’s eye.” These people often have good navigational skills such as Christopher Columbus. The following should be considered whenever possible:
- Narrative – written text
- Tabular – tables
- Charts – bar charts, pie charts
- Color – bold – underlined text
- Pictures – photographs, images
- Diagrams – 2d,3d
- Process logic – flowcharts

Including various combinations of the above is extremely useful. A flow chart might help with navigating the document while pictures are very useful in dressing procedures for entry into cleanrooms.[14]

Completing Documents and Record Keeping:
After documents have been designed, prepared, and approved, they must be used and completed properly. For example, where documents require the entry of data, these entries must be made in clear legible handwriting using a suitable indelible medium -- not a pencil. Sufficient space must be provided for entries. With such entries, it is important that any correction made to a document or record must be signed or initialed and dated; the correction must permit the reading of the original information. Where appropriate, the reason for the correction must be recorded. With record-keeping in general, a record must be kept at the time each action is taken. All activities concerning the conduct of preclinical studies, clinical trials, and the manufacture and control of products must be traceable.[15]

Documents Storage:
Storage of critical records must at secure place, with access limited to authorized persons. In relation to this, 21CFR 211.180(d) states "…these records or copies…shall be subject to photocopying or other means of reproduction as part of such inspection. Records that can be immediately retrieved from another location by computer or other electronic means shall be considered as meeting the requirements of this paragraph."

The storage location of document must ensure adequate protection from loss, destruction, or falsification, and from damage due to fire, water, and other disasters. Records which are critical to regulatory compliance or to support essential business activities must be duplicated on paper, microfilm, or electronically, and stored in a separate, secure location in a separate building from the originals. If electronic, photographic or other data processing systems are used for the retention of documents, an appropriate storage for required duration is necessary to protect against loss or damage. It is particularly important that during the period ofretention, the data can be rendered retrievable and legible within an appropriate period of time. This means having a

DIRECTOR
Yashoda Technical Campus
Satara
YASHODA TECHNICAL CAMPUS SATARA

validated system of data recall. The data should also be availablein a legible form. Rapid retrieval of reports and data is essential for audits.[16]

CONCLUSION:

From the above review we are concluded that good documentation practices are a need of pharmaceutical industry. documentation is essential to achieve total approach towards GMP. The goal of good documentation practices is defined manufactures of system information. Documentation also serves as existence of evidence and allows traceability.

CAPA: An important concept of Quality Assurance in Pharmaceutical Industry

Chavan Pooja Ajit[1]*, Avinash Mahadeo Bhagwat[1], Atul Prabhakar Chaudhari[2]
[1]YSPM's Yashoda Technical Campus, Faculty of Pharmacy (B. Pharm), Satara
[2]Lecturet Smt SS Patil Institute of Pharmacy, Chopda, Dist. Jalgaon 425107
*Corresponding Author E-mail: **chavanp978@gmail.com**

ABSTRACT:
CAPA is used in the improvements to be made in product, process or quality system to eliminate non-conformities and other undesirable situation. CAPA could be regulatory concept that focuses on systematic investigations to search out the root cause, understanding and correcting discrepancies while attempting to avoid their reoccurrence. Instructions for a way they must be handled within the organization just in case of potential product problems, customer complaints or action to eliminate the cause of a detected nonconformities or incident. Regulatory inspections give more importance for CAPA, for the explanation, it will high light the systems followed within the company additionally because the technical capability of the people concerned. Changes proposed are to be verified and validated to confirm the effectiveness and quality attribution. CAPA is also an integrated part of ISO: 13485 and Good Manufacturing Practice (GMP) for medical products. The FDA defines the purpose of a CAPA procedure as: collecting and analyzing information, identifying and investigating product and quality problems, and taking appropriate and effective corrective and/or preventive action to prevent their recurrence. There is not a regulatory defined framework for the CAPA process only different requirements. The CAPA system investigation document will provide a clear picture of how the standard system works and hence, Regulatory Inspectors give lot of importance to audit this method. Real root cause is to be identified with scientific proof and which further may not be generated. This review provides comprehensive views on steps involved in corrective action and preventive action (CAPA), mechanism of taking CAPA enabling to boost the system of quality management. CAPA is a component of the overall quality management system. As per the FDA documents CAPA accounts for 30-50% of FDA-483 forms issued for noncompliance.

KEYWORDS: Non-conformities, Root Cause, Regulatory Inspectors, Quality Management System.

INTRODUCTION:

Troubleshooting problems and attempting to search out and to avoid potential problem is atypical activity for many companies. Ability to correct existing problems or apply controls to avoid potential problems is vital for customer satisfaction and efficient business practice. Hence, the primitive person during this process is commonly sufficient documentation actions. Appropriate documented actions gives essential historical data for never-ending quality improvements plan are important for any product that has got to meet regulatory guideline demanded by FDA & ISO and other quality system. This

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

can be the rationale to implement a politician Corrective Action/ Preventive Action (CAPA)program.[1] Corrective and Preventive Action (CAPA) is recognition of potential problems of non-conformance/ undesirable affecting the standard of research and to get rid of them to avoid recurrences. It's set of action that laws or regulations need a corporation to require in manufacturing, documentation, procedure, or systems to analyses and to get rid of recurring non-conformance. Non- conformance is to seek out after the systematic evaluation and examine the basis reason for non-conformance. Non-conformance could also be customer complaint or market complaint or a top quality management system, or false of machinery or misinterpretation of written instructions which to be implement work. It must be systematically applied and recognize its ability to get rid of further recurrence of non-conformation. The Eight disciplines problem solving method or 8D framework are often used for an efficient method of structuring of CAPA. CAPA is concept with the subsequent Good Manufacturing Practice (GMP), Hazard Analysis and Risk-based Preventive Controls (HACCP/HARPC) and various ISO business standards. Its main aim to specialize in systematic analysis of the foundation reason behind identified problems or identified risks in a shot to avoid their recurrence (i.e. corrective action) or to avoid occurrence (i.e. preventive action).Corrective action to search out by Statistical Process Control (SPC) which is implement to response to customer compliant, unacceptable levels of product non-conformance, issues to search out during an indoor audit, moreover as adverse or unstable trends in product and process monitoring. Preventive actions are implementing to response to the identification of potential sources of non-conformity. To certify that corrective and preventive action is effective, the systematic inspection of the basis causes of failure is pivotal. CAPA is an element of the general Quality Management System (QMS).[2]

Definition:

Correction:

An action that's taken to eliminate the non-conformity or undesirable situations. However, correction doesn't address causes.

Corrective Action:

A corrective action is term as encompasses the method of reacting to product problems, customer complaints or other non-conformities and fixing them. CA means to forestall the recurrence of non-conformities or undesirable situations. To eliminate the issues that was previously present and reduces their chances of occurring again.

Preventive Actions:

A preventive action may be a process for detecting potential problems or non-conformances and eliminating them. PA means to stop the occurrence of non-conformities or undesirable situations. It is answerable for identifying and keeping away the problem that will arise within the future.[3]

Difference between Corrective and Preventive Actions [4]

Corrective Action	Preventive Action
Reactive	Proactive
Initiated from customer complaint	Initiated from customer suggestion
Existing non-conformity	Opportunity for improvement
The issues is currently affecting the process	No immediate issue affecting the process
A solution is requires now (at least a temporary one)	No need to do something right away
Changes must be made	Changes might not be implemented
A root-cause analysis is required	A root-cause analysis is not required

Objective:

The purpose of the corrective and preventive action subsystem is to gather and analyze information, identify and investigate product and quality problems, and take appropriate and effective corrective and/or preventive action to avoid their recurrence.

Verifying or validating corrective and preventive actions, communicating corrective and preventive action activities to responsible people, providing relevant information for management review and documenting these activities are important in dealing effectively with product and preventing their recurrence, quality problems and minimizing device failures. One amongst the foremost important quality system elements is that the corrective and preventive action subsystem.[5]

What is CAPA per ICH Q10?

A structured approach to the examination process should be used with the target of determining the root cause. The level of effort, formality and documentation of the examination should be equivalent with the extent of risk, in line with ICH Q9.

As per ISO 9000:2005 corrective actions is taken to prevent recurrence whereas preventive action is taken to prevent occurrence.

Corrective and preventive actions even have introduced within the quality management process as defined in the Project Management Book of Knowledge (PMBOK). For understanding regular business of corrective and preventive action is additionally considered a tool within Six Sigma operations. CAPA has strong parallels with Design for Six Sigma (DFSS), won't to design new products or redesign existing products.[6]

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

ICH Q10 Recommends a Product Lifecycle Approach:[6]

Pharmaceutical Development	Technology Transfer	Commercial Manufacturing	Product Discontinuation
The product or process variability is explored. Methodology of CAPA is beneficial where corrective actions and preventive actions are incorporated into the iterative design and development process.	CAPA are often used as a good system for feedback, feed forward, and continual improvement.	CAPA should be used, and therefore the effectiveness of the actions should be evaluated	CAPA should continue after the merchandise is discontinued. The impact on product remaining on the market should be considered, moreover other products that may be affected

Why CAPA?

Corrective Action and Preventive Action or that may be termed as corrective action is to enhance imposed on an organizational process to eliminate undesirable situations and non-conformity. Corrective and preventive action is beneficial to abolish the matter occurred during the manufacturing process. This helps to avoid the re-occurrence of the matter during manufacturing and analysis.

- The estimate the effectiveness of a given action plan.
- The CAPA also certify that information associated with nonconforming products and quality problems emanate from those to blame for the prevention of such problems or assuring the standard of such products.
- The corrective action and preventive action is accountable with for information collection, analysis, identification and analysis of quality and merchandise problems and taking effective and suitable preventive and/or corrective actions in an a trial to stop their occurrence or re-occurrence.
- Providing necessary information for management review, and documenting the activities that are vital in handling with quality and merchandise problems, preventing problem re-occurrence and minimizing or preventing device failure.
- CAPA is a necessary tool for improving organizations processes.
- CAPA is chargeable for validating and verifying preventive and corrective actions, communicating preventive action and corrective action activities to responsible people.[7]

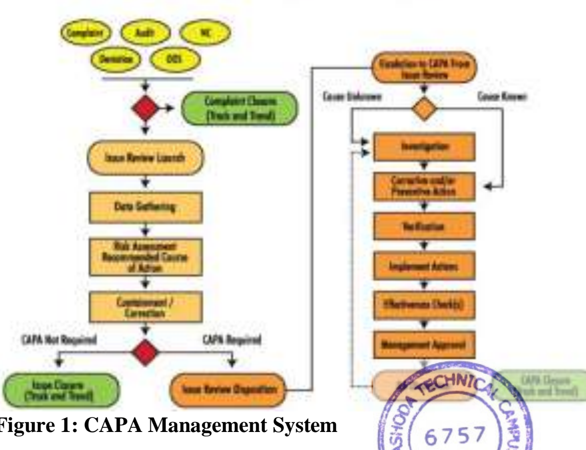

Figure 1: CAPA Management System

5. Fundamental of CAPA Quality Process:

CAPA management software is intended to clarify FDA requirements for corrective/preventative action processes.

To provide effective safeguards versus regulatory risk, CAPA is mostly a module within a comprehensive quality management system. If not, it's usually capable of integrating with management systems for audits, nonconformities, document management, change control, and other capabilities.

Unfortunately, the FDA offers minimal auspice on selecting a CAPA system. At a high level, the CAPA system must:

- Include CAPA procedures which address quality system requirements
- Facilitate data investigate to spot the sources of product quality concerns
- Enable the organizations to watch trends for preventive action
- Integrate with surrounding systems and QA processes to assure the info quality
- Facilitate statistical analysis and formal failure investigations
- Allow organizations to validate the success of preventive or corrective actions

These requirements definitely don't translate on to software features. As such, an intimate understanding of the CAPA quality process is required.

1. Detection:

The problem identification and CAPA detection phase requires a suitable documentation of the problem at hand. The outline should be complete including who, what, when, where, why, and the way many.

Moreover, a risk assay should be performed supported compliance risk. The results of the chance analysis should acquaint the CAPA timeline. It should be obvious that low-risk issues don't have the identical sense of urgency as high-risk issues.

2. Investigation and Root Cause Determination:

The quality management teams should confide to rapid investigation and root cause determination. There are several methods for conducting analysis including:

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

- Brainstorming
- Flowcharting
- Fishbone Diagrams
- Affinity Diagrams
- Physics of Failure

Typically, root cause determination is aid. by quality management systems. With end-to-end traceability, you can easily track every change and action from starting to end with fully integrated, closed-loop quality processes.

3. Proposed Corrections:
In this next phase, correction and condition should be completed as soon as possible to forestall further disruption. Moreover, organizations should proactively review processes and procedures to spot broader issues. Just in case of a product-related issue, field correction and/or recall are also required.

4. Implementation:
At this time, long-term corrective and preventative actions work to see or eliminate the explanation for nonconformity. A corrective action is an action that deletes the cause of nonconformity. On the flipside, a preventative action is an action to delete the explanation for potential nonconformity.

5. Verification of Effectiveness:
Finally, validate or verify corrective and preventative action effectiveness. Once a CAPA investigation is complete, determine if nonconformities are determined. Moreover, to see if corrective and preventative actions haven't created new areas of inconsistencies. Any changes done to the assembly process that were made to deal with a difficulty should even be seen as a replacement source of potential problems. [8]

Stages of CAPA

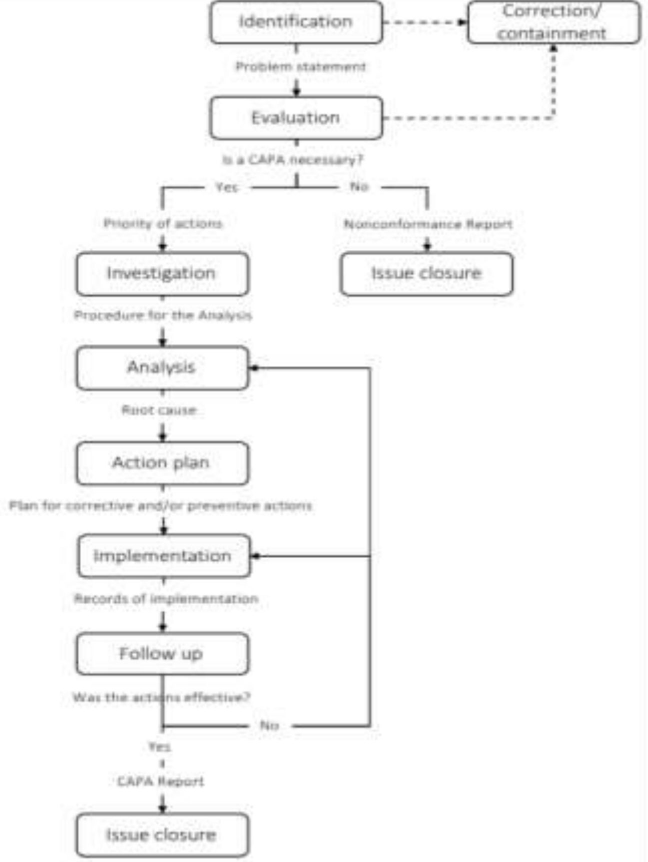

Figure 2: Flow Chart of Stages

1. Identification:
Identification defines an existing problem or a possible problem. It includes:
- Explanation of problems
- Documentation of accessible evidence
- Internal audits, process monitoring, data trends, customer complaints and QA inspection

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara
4

2. **Evaluation:**

The objective is to see the necessity for action and also the level of action required

- Potential impact – concerns the impact on company and clients in terms of cost, product quality, safety and customer satisfaction
- Risk – level of risk related to the matter
- Remedial action – potential impact and risk assessment to assist decide the desired remedial action

3. **Investigation:**

- Review various parameters associated with a controversy e.g. equipment, materials, procedures, analyst training, software capabilities and environmental parameters
- Fix individual responsibilities and resources requirement such as finances, manpower and equipment. These requirements are worked out and documented

4. **Analysis:**

Analysis leads to the root cause of the problem

- Collect data and try to list out the possible sources so as to arrive at the root cause. Data may come from such sources as records, processes, service information, operations, etc.
- Root cause will not simply deal with symptoms but help uproot the main contributing factors

5. **Action Plan:**

- Action plan is aimed at correcting and preventing future occurrence of failure. Plan involve to changes to be made in existing procedures and assignment of responsibilities
- All modifications and changes must be tell too concerned personnel, departments and suppliers
- Employee training is an essential part of any change and is always part of an action plan

6. **Implementation:**

Implementation stage involves:

- Execution of identified tasks
- Modification in documents
- Modification in processes
- Modification in environmental conditions
- Provision of training on modifications

All stages in implementation stage need to be correctly documented

7. **Follow Up:**

The follow up confirms completion of the identified tasks and also assesses the appropriateness and Effectiveness of the action taken. The validatory report must record:

- If the main cause of the problem is solved
- Any resulting secondary situations have been corrected
- Proper controls established to prevent future recurrence
- Actions taken that have no other adverse effects
- Adequate monitoring arrangements that are in place which assigned the responsibilities

A CAPA report should be signed by the authorized or well experience personnel within the operational divisions of the organization. [9]

What is a CAPA Report?

A CAPA (Corrective and Preventive Action) Report may be a tool utilized in identifying, addressing, and preventing regulatory and organizational non-conformance. Compliance officers record the main points of a problem or incident on a CAPA Report form, which primarily includes a summary of the event, date of occurrence, items and other people involved, corrective actions taken, and preventive action established to avoid future recurrence.

Here is an example scenario of a CAPA report's response to an incident:

Sample Incident:

A working man is injured because of the improper use of commercial machinery.

Corrective Action – this is the action taken to instantly address the prevailing problem.

The worker is given trending and brought to the closes hospital for further treatment.

Preventive Action:

This is often the action taken to stop recurrence of the identical problem.

Workers are trained on the right use of commercial machinery to avoid recurring accidents and injuries.

When to put in writing CAPA Report:

A CAPA report is flexible and may be used for various sorts of issues and incidents. However, not every event warrants a CAPA report. Quality teams must utilize risk management techniques to see the severity of an event and choose if a CAPA report is required.

Here are some situations where a CAPA report is beneficial:

- If the problem is severe/urgent

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

- If the difficulty is recurring
- If the difficulty is systemic[10]

CONCLUSION:

Corrective action and Preventive action (CAPA) is very important path towards improvement and effectiveness of Quality Management System in pharmaceutical industry. It plays a vital role in Quality Risk Management System. The root cause analysis of any problem or deviation is often easily done by implementing CAPA. Pharmaceuticals, healthcare and medical devices industries should strictly follow the CAPA system to maintain the consistent quality in their products. CAPAs, is performed to help an organization to improve its competitive position by improving processes. Corrective and Preventive Actions are integral parts of a continuous improvement program. An effective CAPA system can help to prevent a warning letter during an audit. CAPA is used as tool for forward and backward traceability. CAPA compliance with the requirements, and get correct nonconformity and which are reasonable to measure the limit of risk. Fortunately, when pharmaceuticals products are failed then we demand for investigation to identify why it's occurred. CAPA is a process which investigates and solves problems, identifies causes, take corrective action and preventive recurrences of the root causes. The ultimate purpose of CAPA is to assure the problem that can never be experienced again. Hence, it is compulsory to implement the CAPA system in pharmaceutical industry to maintain the consistent quality in their products.

ABSTRACT:
Tadalafil is a phosphodiesterase 5 inhibitor accustomed to treat dysfunction, benign prostatic hyperplasia, and pulmonary arterial hypertension. Tadalafil is an orally administered drug and it's marketed worldwide under the name Cialis. Analytical method development and validation play important roles within the discovery development and manufacture of pharmaceuticals. These methods is to make sure the identity, purity, potency, and performance of drug product. The bulk of the analytical development effort goes into validating a stability indicating HPLC–method. Analytical method development could be a process of proving that the developed chromatography method is suitable for its intended use within the development and manufacturing of the pharmaceutical drug substance and drug product. All analytical methods that are intended to be used for analyzing any clinical samples will have to be validated. The target of the strategy validation is to demonstrate that the strategy is suitable for its intended purpose because it is stated in ICH guidelines.

KEYWORDS: Tadalafil, Phosphodiesterase 5 Inhibitor, Erectile dysfunction, High performance liquid chromatography, Validation.

INTRODUCTION:
Male erectile dysfunction has been defined as the persistent inability to attain and maintain an erection adequate to permit satisfactory sexual performance. Although erectile dysfunction is regarded as a benign disorder, it has a medical and social impact due to its high prevalence, costs and implications for the quality of life for many men and their partners.

A recent review concludes that the prevalence of erectile dysfunction of all degrees is 52% in men 40 to 70 years old, with the incidence increasing with advancing age. Normal erectile function requires the coordination of psychological, hormonal, neurological, vascular and anatomic factors. Alteration of any of these factors is sufficient to cause erectile dysfunction.[1]

Tadalafil is reversible phosphodiesterase type 5 (PDE5) inhibitor approved for the treatment of erectile dysfunction (ED). As a category PDE5 inhibitors (including sildenafil and vardenafil), enhance erectile response to sexual stimulation by increasing penile blood flow. The duration of action of Tadalafil is longer than sildenafil or vardenafil.[2]

Tadalafil (CIALIS) is an orally administered PDE5 inhibitor has been developed for a treatment for erectile dysfunction. When sexual stimulation causes the local release of nitric oxide gas, which plays a central role within the vasodilation of erectile tissues by stimulating guanylyl cyclase activity, consequently raising intracellular concentrations of cyclic guanosine monophosphate (cGMP) and relaxing vascular smooth muscle. This leads in smooth muscle relaxation and inflow of blood into the penile tissues, thereby producing an erection. Thus tadalafil is indicated for the treatment of male erectile dysfunction. Tadalafil has no effect within the absence of sexual stimuli.[1]

Tadalafil is a phosphodiesterase 5 inhibitor accustomed treats erectile dysfunction, benign prostatic hyperplasia, and pulmonary arterial hypertension. Tadalafil is practically insoluble in water. It does not possess any ionisable groups within the pH range of 1-11 and, subsequently, doesn't demonstrate any changes in solubility in aqueous buffers in this range. It is freely soluble only in solvents like as dimethylsulfoxide and dimethylformamide.[1]

This molecule has 2 chiral centers and thus four different stereoisomers are also found. The molecule obtained in the process described is within the RR form. Crystallization studies show that Tadalafil doesn't exhibit polymorphism.[1]

Chemistry:

1. Synonyms: Adcirca, Cialis, GF196960, HSDB7370, IC351, ICOS351, Tadalafil, Tadalafil Lilly, UNII-742SXX0ICT
2. IUPUC:(6R,12aR)-6-(1,3-benzodioxol-5-yl)-2-methyl-2,3,6,7,12,12a-hexahydropyrazino[1',2':1,6]pyrido[3,4-b]indole-1,4-dione
3. Formula: C22H19N3O4
4. Molar mass: 389.411 g·mol−1 [3]

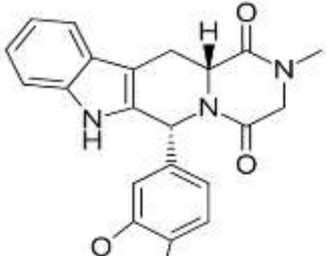

Figure 1: Chemical Structure of Tadalafil

This study is to develop an easy and accurate RP-HPLC method for the estimation of Tadalafil in tablet dosage form. The method validation is to demonstrate that the strategy is suitable for its intended purpose because it is stated in ICH guidelines. The strategy was validated for linearity, precision, accuracy, specificity, and limit of detection, limit of quantification, robustness and system suitability.[4]

MATERIAL AND METHOD:

Material:

Tadalafil pure drug sample obtain from Tadacip 20 tablet which is manufactured at Cipla Ltd, India. HPLC grade Acetonitrile was procured from E. Merck Ltd, India. SQ grade Potassium Hydrogen Orthophosphate was purchased from Fisher Scientific. AR grade Orthophosphoric Acid was purchased from Rankem. Milli-Q water was used throughout the experiment. Tadacip 20 tablets were purchased from local pharmacy.

Instrumentation:

Analysis was performed on a Summit HPLC chromatographic system, Low Pressure Quaternary Gradient Dionex manufacturer equipped with ASI-100 Automated sample injector, LPG-4 HPLC Pump, programmable variable wavelength PDA-3000 detector. Chromatographic separation was achieved by Agilent eclipse C_{18} column (4.6 x 250mm, 5um). The HPLC system was equipped with "Chromeleon 6.8 SR 11" software to acquire and process the data. Peak purity was checked the PDA detector.[5]

METHODOLOGY:

Standard solutions:

Weigh accurately and transfer about 40mg Tadalafil standard in 200ml volumetric flask. Add about 150ml of Mobile phase. Sonicate for 5 minutes. Allow the solution to attend room temperature and dilute up to mark with mobile phase.

Mobile phase:

Phosphate Buffer pH 4.0: 1.360gm. of Potassium Di-hydrogen Orthophosphate dissolved and diluted in 1000 ml water. Adjust the pH to 4.0 with dilute ortho phosphoric acid. Phosphate buffer pH 4.0: Acetonitrile (50:50). Mix, Sonicate and filter through 0.45 micron nylon filter paper.

Chromatographic Conditions:

An isocratic condition HPLC analysis was performed an Agilent Eclips C18 (150 x 4.6mm, 5um) maintained at conditions (30°C). Chromatographic separation was achieved with mobile phase and mixture of at flow rate of 1.0ml/min and injection volume of 20µl and also the run time is 6 min. the Tadacip 20 was scanned under conditions and from the spectra maxima of 284nm was observed.

Assay of formulation:
Procedure:
Weigh 20 Tablet at a time. Calculate Average weight. Crush Mix to make uniform and perform assay from it.

Sample Preparation:
Weigh and transfer sample powder containing about 40 mg of Tadalafil in 200ml volumetric flask. Add about 150ml of mobile phase. Sonicate for 20 minutes. Allow to attend room temperature. Dilute up to mark with mobile phase. Filter with whatman 41 or equivalent filter paper.

Inject blank, standard and Sample preparation as sequence given below,

(1) Blank (2) Standard preparation (5 replicates) (3) Blank (4) Sample preparation (5) Standard preparation (Bracketing standard)

Perform calculation for system suitability parameters –% RSD of retention time and area of standard replicates, cumulative %RSD of retention time and area of replicate standards with bracketing standard.

System suitability criteria:
1. %RSD for retention time of replicates of standard preparation should not be more than 1.0%
2. %RSD for area of replicates of standard preparation should not be more than 2.0%
3. Theoretical plates for all the standard injections should not be less than 2000. Report Theoretical plate of first replicate of standard preparation.
4. Tailing factor for all the standard injections should not be less than 2.0. Report tailing factor of first replicate of standard preparation.
5. Cumulative %RSD for retention time of replicates of standard preparation with retention time of bracketing standard should not be more than 1.0 %
6. Cumulative %RSD for area of replicates of standard preparation with area of bracketing standard should not be more than 2.0%

If system suitability found within limit, perform calculations for content of Tadalafil Tablet by using formula, Calculate Content of Tadalafil (mg/Tablet) for sample preparations independently by using formula described below.

(Area of Tadalafil in sample preparation) W1 (mg) 200 P1
= --**x---x-----x-x**W3 (gm.)
(Avg. area of Tadalafil Standard preparation) 200 W2 (g) 100

Where,
W1 = Weight of Tadalafil standard taken for preparation of standard preparation (in mg)
W2 = Weight of Tadalafil sample taken for preparation of sample preparation (in g)
W3 = Average weight of Tablet in gm.
W = Weight of sample in gm.
P1 = % Purity of Tadalafil Standard

Acceptance Criteria:
Each film coated tablet content:
Tadalafil per tablet = 18.00mg to 22.00mg

% Assay = 90.00% to 110.00%

Method validation:
A. Specificity and system suitability:
- Experimental design:
1. Inject mobile phase to observe interference at interested peaks.
2. Prepare and inject std preparation individually (as per final conc. Of mixed std preparation).

- **Acceptance criteria:**
1. There should not be interference of any peak at interested peaks.
2. System suitability parameter should meet and assay for tadalafil 20mg should be within limit.

B. Precision
a) Repeatability:
- Experimental design:
  Perform assay in six individual replicates of sample. Perform % RSD of assay.
- Acceptance criteria:
  % RSD for assays should be within less than 2%

b) Intermediate precision:
- Experimental design:
1. Perform assay in six individual replicates of sample by other person on other day with other set of chemicals.
2. Perform %RSD of six sample preparations.
3. Also calculate % variation of average assay values obtained via repeatability and intermediate precision.

- **Acceptance criteria:**
1. Assay for all samples should be within limit.
2. % RSD for assays for intermediate preparation should be less than 2%.
3. % variation of average assay values obtained via repeatability and intermediate precision should be less than 3%.

C. Accuracy:
- **Experimental design:**
1. Prepare samples in triplicate by taking weight equivalent to 80%, 100% and 120% of working levels and perform analysis.
2. Calculate % recovery by factors amount added vs.

DIRECTOR
Yashoda Technical Campus
Satara

amount recovered.
3. Calculate %RSD of recovery at each level for triplicate preparations.

- **Acceptance criteria:**
1. % recoveries of individual preparation should be 98 to 102%.
2. % RSD at each level should not be more than 3%

D. Linearity and range:
- Experimental design:
1. Prepare standard preparations at each 80%, 100% and 120% of working level and inject them.
2. Determine co-relation coefficient by plotting linearity graph. Calculate % y intercept

- **Acceptance criteria:**
1. Graph should be linear and co-relation coefficient should be not less than 0.999
2. % y intercept should be within ±2%

E. LOD AND LOQ
- **Experimental design:**
1. 5ppm solution to be prepared and signal to noise ratio is determined.
2. LOD is determined by preparing diluted solutions with signal to noise ratio about 3.
3. Level of concentration at which peak got detected repeatedly but not necessary to be precise is LOD.
4. LOQ is determined by preparing diluted solutions with signal to noise ratio above 3 and about 10.
5. Level of concentration at which peak got detected with precise area (%RSD NMT 2%) is LOQ.

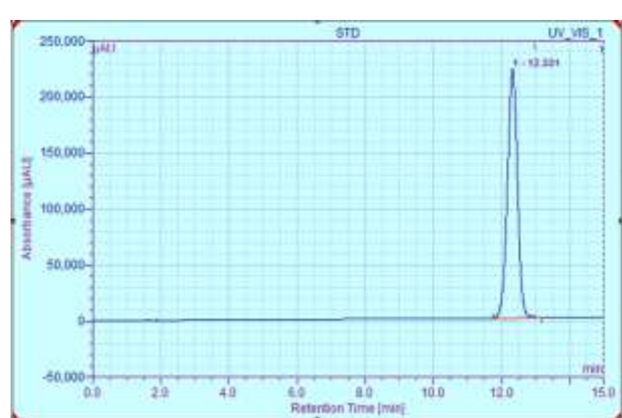
- **Acceptance criteria:**
1. For LOD Single to noise ratio is about 3.
2. For LOQ Single to noise ratio is about 10.
3. For LOQ, %RSD for replicate injections should be less than 2 %

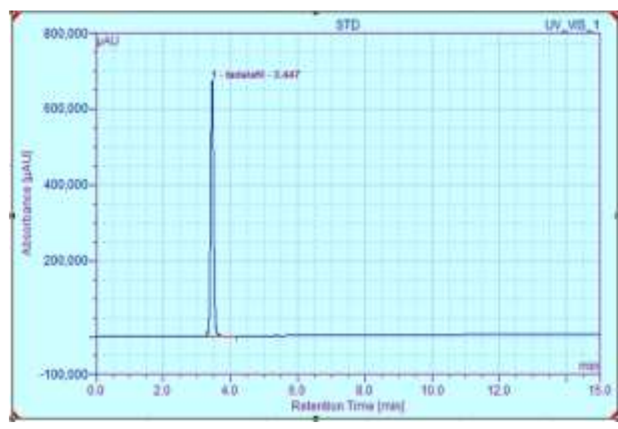
F. Robustness:
- Experimental design:
1. Perform analysis of sample by changing flow rate as 0.8 and 1.2ml per minutes.
2. Perform analysis of sample by changing wavelength 282 nm and 286nm.
3. Calculate % cumulative RSD of assay obtained at repeatability and by changing parameters.
- Acceptance criteria:
1. % cumulative RSD of assay obtained at repeatability and by changing parameters should not be more than 3 %

Non-conformance:
Specify the non-conformance (if any) observed during method validation.

RESULT AND DISCUSSION:
Method development and optimization:
In order to optimize the LC conditions for the estimation of Tadalafil in tablet the following trials were performed. Initially a mobile phase consisting of 50mM Potassium Di-hydrogen Orthophosphate (pH 5.0): Acetonitrile (80:20 %v/v) at a flow rate of 1.0mL/min was used on an Agilent Eclipse C18 column (250 x 4.6) column at ambient temperature using mobile phase as diluent, Tadalafil did not elute under these conditions,

In the next trial, same column was employed but the mobile phase was changed to mobile phase consisting of 10 mM Potassium Di-hydrogen Orthophosphate (pH 5.0): Acetonitrile (70:30% v/v) at a flow rate of 1.0 mL/min was used on an Agilent Eclipse C18 column (250 x 4.6) column at ambient temperature.





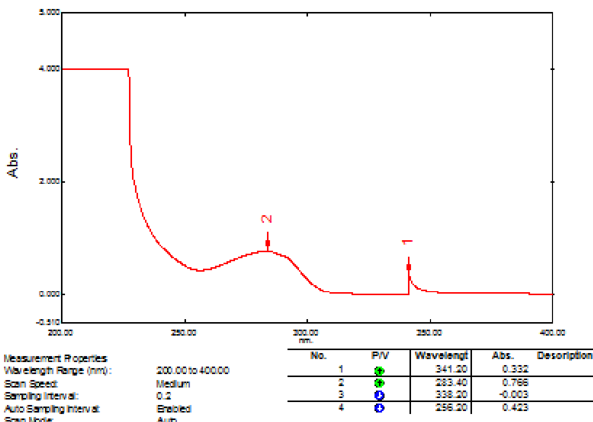
Tadalafil eluate with at 12.331 with theoretical plates 4234 (limit NLT 2000 and Tailing factor 1.58 (NMT2) which well within the limit but as retention time is more and will time consuming during analysis therefore focusing on reduction of retention time drastically. pH of buffer solution reduced with dilute Orthophosphoric acid

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

solution. Organic Solvent content in mobile phase composition increased and also temperature of column increased.

Tadalafil eluate with at 3.447 with theoretical plates 3431 (limit NLT 2000 and Tailing factor 1.55 (NMT 2) which well within the limit. Thus further injection of same std is done and to conclude precision. Corresponding area, RT and system suitability parameters observed.

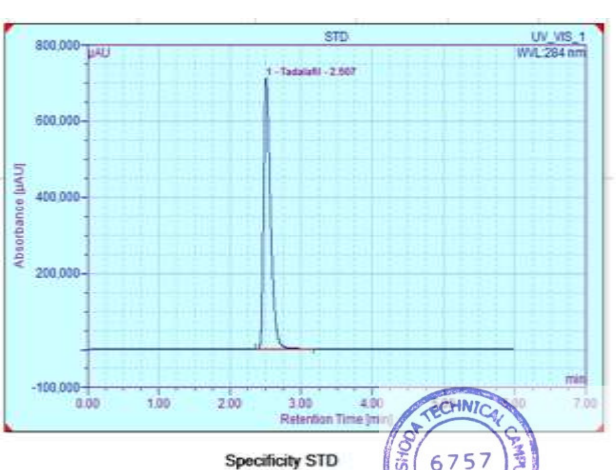
Lambda max is determined before conducting next trial and found 284nm.Next trial conducted with mobile phase consisting of 10mM Potassium Di-hydrogen Orthophosphate (pH 4.0): Acetonitrile (50:50% v/v) at a flow rate of 1.0mL/min was used on an Agilent Eclipse C18 column (250 x 4.6) column at 30°C.



Method validation

A. Specificity And System Suitability:

Specificity demonstrated by observing interference of mobile phase (Diluent). System suitability parameters (% RSD of area, Retention time, Theoretical Plates and Tailing factor) demonstrated by injecting standard preparation in replicate.



Specificity STD

Table no1: Specificity and System Suitability

Std Inj No	Retention Time	Area	Theoretical Plates	Tailing Factor
1	2.507	80482.079	3436	1.59
2	2.507	81838.312	3359	1.59
3	2.508	80682.928	3412	1.58

% RSD	0.04 (Limit NMT 1 %)	0.81 (Limit NMT 2 %)	Limit: NLT 2000	Limit: NMT 2

No interference observed from Mobile phase (Diluent).

Conclusion – Method found specific and capable to achieve System suitability.

B. PRECISION:

A. Repeatability:

The repeatability was demonstrated by preparing the standard solution at 200ppm concentration and six independent consecutive sample preparations at 200 ppm. System suitability found within limit. Relative standard deviation of assay value for six preparations found within 2 %.

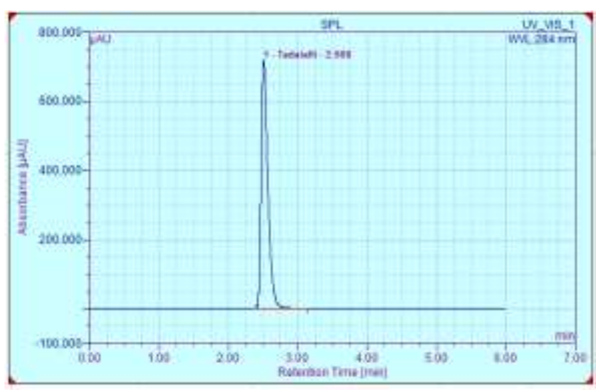

Table no 2: Repeatability Suitability System

Std Inj No	Retention Time	Area	Theoretical Plates	Tailing Factor
1	2.507	80550.869	3436	1.59

Conclusion – Method found Linear in the range 80 % to 120 % of working level

E. Limit of Detection and Limit of Quantitation (LOD and LOQ):

The limit of detection and limit of quantification means the lowest concentration of analytes in the sample are detected and quantified. LOD and LOQ was found as listed below

Table no 6: LOD and LOQ

Parameter	Obtained value
LOD	0.00035 ppm
LOQ	0.00523 ppm

F. ROBUSTNESS:

Robustness of the method was determined by intentionally changing some operating conditions such as flow rate and wavelength. The flow rate as per the developed method is 1.0ml/min. It has been purposely changed to 0.8ml/min and 1.2ml/min and the chromatogram was developed as well as the wavelength of developed method is 284nm. It has been purposely changed to 282nm and 286nm and the chromatogram was developed.

Conclusion – Method found Robust.

Non-conformance: Specify the non-conformance (if any) observed during method validation.

CONCLUSION:

The proposed RP-HPLC method was simple, sensitive, precise and accurate for determination of Tadalafil n tablet dosage form. The results obtained for all validated parameters were within the limits; hence the proposed method can be easily applied for the quantification of Tadalafil in routine quality control pharmaceutical laboratories. The analytical method used for determination of assay of Tadalafil Tablet is within acceptance criteria for the analytical parameters such as Specificity and system suitability, Linearity and Range, Precision, Accuracy and Robustness. Hence method stands validated.

ACKNOWLEDGEMENT:

Author are thankful to Insta Vision Laboratory and services, Satara for providing gift sample of tadalafil drug and as well as technical support and also thankful to Management and Principal Dr. V. K. Redasani of YSPM, YTC Faculty of Pharmacy (B. pharm), Satara, for providing necessary facilities to carry out this work.

ABSTRACT:

The aim of the present research work was to systemically device a model of factors that would yield an optimized release modulating dosage form of an anti-hypertensive agent, losartan potassium, using response surface methodology by employing a 3-factor, 3-level Box-Behnken statistical design. Independent variables studied were the amount of the release retardant polymers – aminated fenugreek gum *(X_1)*, aminated tamarind gum *(X_2)* and aminated xanthan gum *(X_3)*. The dependent variables were the burst release in 15 min *(Y_1)*, cumulative percentage release of drug after 60 min *(Y_2)* and hardness *(Y_3)* of the tablets with constraints on the Y_2 = 31–35%. Statistical validity of the polynomials was established. In vitro release and swelling studies were carried out for the optimized formulation and the data were fitted to kinetic equations. The polynomial mathematical relationship obtained $Y_2=32.91-2.29X_1-5.68X_2-0.97X_3+0.20X_1X_3-0.005X_2X_3-0.92X_1^2-1.89X_2^2$ explained the main and quadratic effects, and the interactions of factors influencing the drug release from matrix tablets. The adjusted (0.9842) and predicted values (0.9600) of r^2 for Y_2 were in close agreement. Validation of the optimization study indicated high degree of prognostic ability of response surface methodology. The Box-Behnken experimental design facilitated the formulation and optimization of release modulating matrix systems of losartan potassium.

KEYWORDS: Release modulating matrix tablets; Amination of natural polymers; Losartan potassium; Box Behnken statistical design; Response surface methodology.

INTRODUCTION:

Oral drug delivery is the most preferred and appropriate preference as the oral route provides maximum active surface area amongst all drug delivery system for administration of a various drugs. Significance of these dosage forms is due to awareness to toxicity and ineffectiveness of drugs when administered by oral conventional method in the form of tablets and capsules. Developing oral sustained release matrix tablets for drug with constant release rate has always been a challenge to the pharmaceutical technologist [1]. Usually conventional dosage form produces wide range of

variation in drug concentration in the bloodstream and tissues with consequential undesirable toxicity and poor efficiency, poor bioavailability. So the maintenance of concentration of drug in plasma within therapeutic index is very significant for effective treatment and high bioavailability [2],[3]. Drug release through various matrix system is determined by Water penetration, Polymer swelling, Drug dissolution, Drug diffusion, Matrix erosion have been utilized as formulation sustained release drug delivery. Sustained release dosage forms offer better control of plasma level less dosage frequency, less side effect, increased efficacy and constant delivery [4].

A polymer is a large molecule (macromolecules) composed of repeating structural units. These subunits are typically connected by covalent chemical bonds. Both synthetic and natural polymers are available but the use of natural polymers tier pharmaceutical applications is attractive because they are economical, readily available and non-toxic. They are capable of chemical modifications, potentially biodegradable and with few exceptions, also biocompatible [5]. Derivatization of native polymer led to enhancement in bioadhesive and drug release characteristics [6]. Recently, chemical modification or derivatization of natural polysaccharides has been reported to improve the functional properties of native gums. Reports in the literature suggest that the derivatives of polysaccharides (amine, thiol, carboxymethyl) can be employed to manipulate swelling, bioadhesion and drug release [7]. A few examples of polysaccharide derivatives already reported in literature include aminated fenugreek gum [6], aminated tamarind kernel polysaccharide [8] and aminated xanthan gum [9]. Polymeric material have fulfilled different roles such as binders, matrix formers or drug release modifiers, film coating formers, thickeners, viscosity enhancers, stabilizers, disintegrants, Solubilisers, emulsifiers, suspending agents, gelling agents and bioadhesive.

Losartan potassium (LP) is a potent, highly specific angiotensin II type 1 (AT1) receptor antagonist with antihypertensive activity [10], [11]. It is readily absorbed from the gastrointestinal tract with oral bioavailability of about 33% and a plasma elimination half-life ranging from 1.5 to 2.5 h. Administration of LP in a controlled release dosage form with dual release characteristics i.e., burst release followed by an extended release over 8 h, would be more desirable as these characteristics would allow a rapid onset followed by protracted anti-hypertensive effects by maintaining the plasma concentrations of the drug well above the therapeutic concentration [12].

Response surface methodology (RSM) is one of the popular methods in the development and optimization of drug delivery systems [13]. Based on the principles of design of experiments (DOE), the methodology involves the use of various types of experimental designs, generation of polynomial mathematical relationships and mapping of the response over the experimental domain to select the optimum formulation [14]. Central composite design (CCD), 3-level factorial design, Box Behnken design and D-optimal design are the different types of RSM designs available for statistical optimization of the formulations [13]. Box-Behnken statistical design is one type of RSM design that is an independent, rotatable or nearly rotatable, quadratic design having the treatment combinations at the midpoints of the edges of the process space and at the center. Additionally, it requires fewer experimental runs and less time a and optimized thus provides a far more effective and cost-effective technique than the conventional processes of formulating and optimization of dosage forms [15].

The current study aimed at developing and optimizing an oral release modulating matrix tablet of LP using computer aided optimization technique i.e. Box Behnken statistical design with constraints on cumulative percentage release of drug after 60 min (31–35%). The Independent variables for the present study were: amount of release retardant polymers – aminated fenugreek gum (X_1), aminated tamarind gum (X_2) and aminated xanthan gum (X_3). The dependent variables studied were the burst release in 15 min (Y_1), cumulative percentage release of drug after 60 min (Y_2) and hardness of the tablets (Y_3).

MATERIAL AND METHODS:

Materials:

Losartan potassium was provided as a gift sample by Viraj Pharmaceutical. (Mumbai, India). Carbopol, magnesium stearate and microcrystalline cellulose were supplied by Thermosil Fine Chem industry. (Charhol). Feenugreek gum, tamarind gum and xanthan gum were purchased from Phyto Lifesciences Pvt Ltd. (Gandhinagar, Gujarat). Starch, isopropyl alcohol and ethylene diamine as a supplied by SD. Fine Chemicals limited. (Mumbai, India). Sodium borohydride was purchased from Karan enterprise. (Mumbai, India). All other reagent and solvents used were of analytical grade and used as received.

Amination of natural polymers:

In 3000ml water add 60gm of natural gum. To this solution add aminating agent ethylene diamine (25ml) with continuous stirring at constant temperature (20-60°C) for 6 hr. Then slowly add reducing agent sodium borohydride ($NaBH_4$) for 2 hr until formation of thick gel. Wash this gel several times with ethyl alcohol and

collect the precipitate of aminated derivative [6], [8], [9]. Synthesized aminated polymer was studied under further parameter for determination of flow properties, chemical stability and thermal properties.

Preparation of compressed matrix:

Drug, carbopol (binder) and the MCC (diluent) were sifted through #40 manually and mixed well to ensure the uniformity of premix blend [16]. Several drug-diluents premixes were then mixed with the selected combination and ratio of hydrophilic polymers (Aminated FG, Aminated TG and Aminated XG), previously sifted through #40, for 5 min. Premix blend was wet granulated with isopropyl alcohol and the granules were sized through #18 and were dried at 45°C for 15 min. Dried LP granules were lubricated with starch and magnesium sterate. The tablets were compressed at an average compression weight of 250mg by cold compression technique on dialed hydraulic press (KBR press) at 12.0mm, circular, flat punches at compressional pressure of 5 tons with 15 s dwell time [17],[18].

Different formulations of Losartan potassium 100mg release modulating matrix tablets were prepared using the following excipients: AFG (7.5-22.5mg), ATG (10–30mg), AXG (12.5–37.5mg), carbopol (30mg), starch (10.25mg), magnesium sterate (1.75mg) and MCC (q.s. to 250mg).

Experimental design:

Box-Behnken statistical screening design was used to optimize and evaluate main effects, interaction effects and quadratic effects of the formulation ingredients on the in vitro release of LP sustained release formulations [17],[19]. A 3-factor, 3-level design used is suitable for exploring quadratic response surfaces and constructing second order polynomial models with Design Expert® (Version 12.0.1.0, Stat-Ease Inc., Minneapolis, MN). This cubic design is characterized by set of points lying at the midpoint of each edge of a multidimensional cube and center point replicates (n = 3). The nonlinear computer-generated quadratic model is given as,

$$\mathbf{Y = b_0 + b_1X_1 + b_2X_2 + b_3X_3 + b_{12}X_1X_2 + b_{13}X_1X_3 + b_{23}X_2X_3 + b_{11}X_1^{\,2} + b_{22}X_2^2 + b_{33}X_3^2}$$

Where Y is the measured response associated with each factor level combination; b_0 is an intercept; b_1 to b_{33} are regression coefficients computed from the observed experimental values of Y; and X_1, X_2 andX_3 are the coded levels of independent variables. The terms X_1 X_2 and $X^{\,2}$ $(i = 1, 2 \text{ or } 3)$ represent the interaction and quadratic terms, respectively. The selected dependent and independent variables are shown (Table 1, left column) along with their low, medium and high levels, which were selected based on the results from preliminary experimentation [20]. The amounts of Aminated FG (X_1), Aminated TG (X_2) and Aminated XG (X_3) used to prepare each of the 15 formulations are given (Table 2).

Table 1: Variables in Box Behnken design

Factor	Level used, actual (coded)		
	Low (-1)	**Medium (0)**	**High (+1)**
X1=AFG (%)	3	6	9
X2=ATG (%)	4	8	12
X3= AXG (%)	5	10	15
Dependent variables	Constraints		
Y1 = % Burst release in 15 min	10 ≤ Y1 ≤ 15		
Y2 = % Dissolution after 60 min	31 ≤ Y2 ≤ 35		
Y3 = Hardness (kg/cm2)	Maximize (range 3.5–5.5)		
*All percentages were calculated with respect to total tablet weight of 250mg			

Tablet assay and physical evaluation:

The tablets were assayed for drug content using methanol as the extracting solvent, and the sample were analyzed spectrophotometrically (Shimadzu- UV-1800, Japan) at 215 nm [17], [20]. Tablets were also evaluated for the hardness (n = 6) (Monsanto hardness tester), friability (n = 6) (Roche Friabilator, 100 rpm), weight variation (n = 20) and thickness (n = 10) (Vernier caliper).

In vitro drug release studies:
Dissolution studies were performed using the USP II, paddle-rotating method (Electrolab dissolution tester, Electro lab, India) at 37°C ± 0.5°C and 75rpm using 0.1 N HCl (2 hr) and phosphate buffered solution, pH 6.8 (PBS) (10 hr), as the dissolution media. Dissolution studies were carried out in triplicate, maintaining the sink conditions for all the formulations. A 5ml aliquot of sample was withdrawn at regular time intervals, filtered and assayed spectrophotometrically at 205.3nm. The cumulative % drug release was calculated for the formulations [21],[22].

Swelling and erosion studies:
Swelling and erosion studies of the matrix tablets were carried out under conditions identical to those described for the dissolution testing. After 2 hr in 0.1 N HCl and 6 hr in phosphate buffer, pH 6.8, the tablets were removed, gently wiped with a tissue paper to remove surface water and Scanning Electron Microscopy (SEM) study of the hydrated swollen tablets was carried out [17],[23]. Water uptake and mass loss were determined gravimetrically according to the following equations;

Degree of swelling (water uptake)=
(Wet weight - Original dry weight)/(Original dry weight)

Erosion (% mass loss)=
(Original weight - Remaining dry weight)/(Original weight)

Thermal properties:
Differential scanning calorimetry (DSC) experiments were performed on drug, excipients and the optimized formulation using DSC (Perkin–Elmer, Norwalk, CT). The instrument was calibrated using indium standards. Accurately weighed samples (5–10mg) were hermetically sealed in flat bottom aluminum pans and heated from 48 to 300°C at a rate of 10°C per min under an atmosphere of nitrogen. Thermograms were normalized and rescaled as needed before overlapping [11],[24].

Fourier transforms infrared spectroscopy (FTIR):
FTIR studies were performed on drug, excipients and the optimized formulation using Shimadzu FTIR (Shimadzu Corp., India). Background spectrum was collected before running each sample. The samples were analyzed between wavenumbers 4000 and 400 cm^{-1}.

Optimization data analysis and validation of optimization model:
Statistical validation of the polynomial equation generated by Design Expert® was established on the basis of ANOVA provision in the software. A total of 15 runs with triplicate center points were generated. The models were evaluated in terms of statistically significant coefficients, standardized main effects (SME) and R^2 values. Various feasibility and grid searches were conducted to find the compositions of optimized formulation. Various 3-D response surface graphs were provided by the Design Expert software. By intensive grid search performed over the whole experimental region, nine optimum checkpoints formulations were selected to validate the chosen experimental domain and polynomial equations. The optimized checkpoint formulations were prepared and evaluated for various response properties. The resultant experimental values of the responses were quantitatively compared with that of the predicted values. Also, linear regression plots between actual and predicted values of the responses were produced using MS-Excel.

RESULTS AND DISCUSSION:

Characterizations of derivetized natural polymers:
The synthesis polymers are characterized using ATR-FTIR, DSC and XRD studies. In this study, synthesis polymers are confirmed by ATR-FTIR study. The ATR-FTIR study of aminated fenugreek gum, aminated tamarind gum and aminated xanthan gum is confirmed by the appearance of a new peak at 3271 cm^{-1}, 1639.49 cm^{-1} and 2899.01 cm^{-1} respectively corresponding to NH_2 group.

Aminated fenugreek gum:
The DSC thermograms of AFG, in that the AFG shows the broad endothermic peak at 9.94°C with heat of fusion 38.33 J/g, and the exothermic peak does not appeared. These transitions occur at a lower temperature as compared with fenugreek gum. The endothermic peak is due to the loss of water content in polymer (Bassi & Kaur, 2015). The disappearance of exothermic peak due to complete degradation of polymer backbone is observed. These peak shows low thermal stability as compared to fenugreek gum i.e. decreased availability of OH groups for intra-molecular hydrogen bonding. The Tg of AFG was also observed high in AFG (47.34°C) as compared to FG (47.95°C), indicating a high degree of Crystallinity of polymer.

DSC of Aminated tamarind gum:
The DSC thermograms of aminated tamarind, in that the aminated tamarind shows endothermic peak at 82.40°C and 394.50°C with heat of flow 1.002 w/g and 9.231 w/g or the exothermic peak does not appeared. The endothermic peaks are due to the loss of water content in polymer. The disappearance of exothermic peak was 365.35°C and heat of flow 9.639 w/g, due to complete degradation of polymer backbone. The melting point was showed by 276.49°C.

DSC of aminated xanthan gum:
The DSC thermograms of aminated xanthan gum, in that the aminated xanthan gum shows endothermic peak at 71.74°C and 541.66°C with heat of flow 1.644 w/g and 9.424 w/g or the exothermic peak does not appeared.

Table 3: Flow properties of natural gum and derivetized gum

Polymer	Bulk density	Tapped density	Angle of repose	Compressibility index (%)	Hausner's ratio
Fenugreek Gum	0.37	0.41	33.6	18.6	1.22
Aminated Fenugreek Gum	0.39	0.45	35.9	13.33	1.15
Tamarind Gum	0.37	0.41	15.4	9.75	1.1
Aminated Tamarind Gum	0.41	0.55	18.2	25.45	1.34
Xanthan Gum	0.38	0.45	16.7	15.55	1.18
Aminated Xanthan Gum	0.43	0.52	19.1	17.3	1.2

*All value calculated in average of five reading.

The endothermic peaks are due to the loss of water content in polymer. The disappearance of exothermic peak was 430.05°C and heat of flow 11.82 w/g, due to complete degradation of polymer backbone. The melting point was showed by 277.20°C.

The X-ray ray differactograms (XRD):

The X-ray differactograms of aminated fenugreek gum, aminated tamarind gum and aminated xanthan gum. The diffractions curve of aminated fenugreek gum, aminated tamarind gum and aminated xanthan gum was typical of amorphous material with no sharp peaks.

Flow properties and physicochemical evaluation of aminated polymers:

The bulk density, tapped density and angle of repose of synthesized polymers were increased as compared to natural polymer due to reason of chemical modification was done in natural polymer. Compressibility index and Hausner's ratio describe the flow properties of natural polymers and derivetized polymers. Observations as per compressibility index the aminated fenugreek gum shows good flow properties as compare to natural fenugreek gum and aminated tamarind gum shows poor flow properties as compare to natural tamarind gum. In case of aminated xanthan gum compressibility index is partially an increases shows good flow property. The values of Hausner's ratio are < 1.25, shows good flow. Here all derivetized polymers show good flow properties except aminated tamarind gum. Evaluation parameters like bulk density, tapped density, angle of repose, compressibility and Hausner's ratio was carried out for the natural polymers and derivetized polymers and was found to be within the limit as given in Table 3.

Drug content and physical evaluation:

Drug content of the formulations was assayed spectrophotometrically at 215nm. Assayed content of drug in various formulations varied between 98.23% and 100.30% (average 99.35%). Tablet weights varied between 249.29mg and 250.30mg (average 249.93 mg), hardness between 3.5 and 5.5kg/cm^2 (average 4.46 kg/cm^2), thickness between 3.09 and 3.12mm and friability ranged from 0.49% and 0.87% (average 0.73%). Thus all the physical parameters of the compressed matrices were found to be practically within controls.

Fitting of data to model:

A three-factor, three-level Box-Behnken statistical experimental design as the RSM requires 15 experiments (Polynomial analysis). The independent variable and the response for all 15 experimental run are given in Table 2. Eleven batches showed the burst release *(Y1)* of less than 10% and the range of *Y1* for all batches was 6.69–12.41%. The ranges of other responses, Y2 (% dissolution after 60 min) and *Y3* (hardness of the tablets, kg/cm^2), were 21.84–37.53% and 3.5–5.5kg/cm^2, respectively. All the responses observed for 15 formulations and analyzed with polynomial equation of statistics analysis [17] were simultaneously fitted to first order, second order and quadratic models using Design Expert® and the comparative values of R^2, S.D. and % C.V. are given in Table 4 along with the regression equation generated for each response. Responses *Y1*, *Y2* and *Y3* were found to follow linear, quadratic and second order model respectively (Table 4, right column). Only statistically significant ($p < 0.05$) coefficients are included in the equations. A positive value represents an effect that favors the optimization, while a negative value indicates an inverse relationship between the factor and the response. It is evident that the Aminated fenugreek gum *(X1)*, Aminated tamarind gum *(X2)* and Aminated xanthan gum *(X3)* have negative effects on the responses *Y1* and *Y2* in the following order;

ATG (X2) > AFG (X1) > AXG (X3)

Coefficients with higher order terms or more than one factor term in the regression equation represent quadratic relationships or interaction terms, respectively. It also shows that the relationship between responses and factors is not always linear. Used at different levels in a formulation or when more than one factors are changed simultaneously, a factor can produce different degree of response. The interaction effect of *X1* was seen with *X2* and *X3* for response *Y2*; and between *X1* and *X3* for response *Y3*. *X2* also showed a higher quadratic effect as compared to *X1* on response *Y2*. Percentage burst release *(Y1)* and hardness of the tablets *(Y3)* were found to fit the linear and second order models, respectively. In absence of the quadratic effects, *Y1* was mainly dependent upon the amount of ATG. For *Y3*, the critical parameters were found to be the AFG and the ATG.

R^2	88.05%	99.44%	92.06
p- value of lack of fit	0.6624	0.791	0.9678

[a] Only term with statistical significance are included

Standardized main effects and reliability of the models:

Standardized Main Effects (SME), presented in Table 5, SME were calculated by dividing the main effects with the standard error of the main effects [17],[25]. Only statistically significant ($p < 0.05$) values are given. The larger SME value of *X2* suggested the paramount importance of ATG on drug release. R^2-value signifies the percentage of variability in responses that are fitted to the models. In the present study, the high R^2-value of > 99% represents the reliability of the design. Additionally, the *p*-values of lack of fit were greater than 0.05, which further strengthened the reliability of the models (Table 5).

Contour plots and response surface analysis:

Two-dimensional contour plots and three-dimensional response surface plots are presented in Figure 1 which is very useful to study the interaction effects of the factors on the responses. These types of plots show the effects of two factors on the response at a time. In all the presented figures, the third factor was kept at a zero level. Figure 1 (B) and (C) exhibits a nearly linear relationship of factor *X3* with factors *X1* and *X2*, in the form of almost straight line. Response surface plots show the relationship between these factors even more clearly. However, factor *X1* and *X2* have non linear relationship Figure 1 (A) and Figure 1 (D) shows that 39.5 % drug is released after 60 min *(Y2)* when both the AFG and ATG are at lowest level and the decrease in % drug release was polymer concentration dependent. Also the ATG resulted in greater reduction in % release at 12 % level as compared to the AFG at 9% concentration. This indicates a slight non-linear trend between the factors *X1* and *X2*. Figure 1 (E) and (F) show an increasing trend for *Y2* upon the replacement of either of AFG or ATG with AXG.

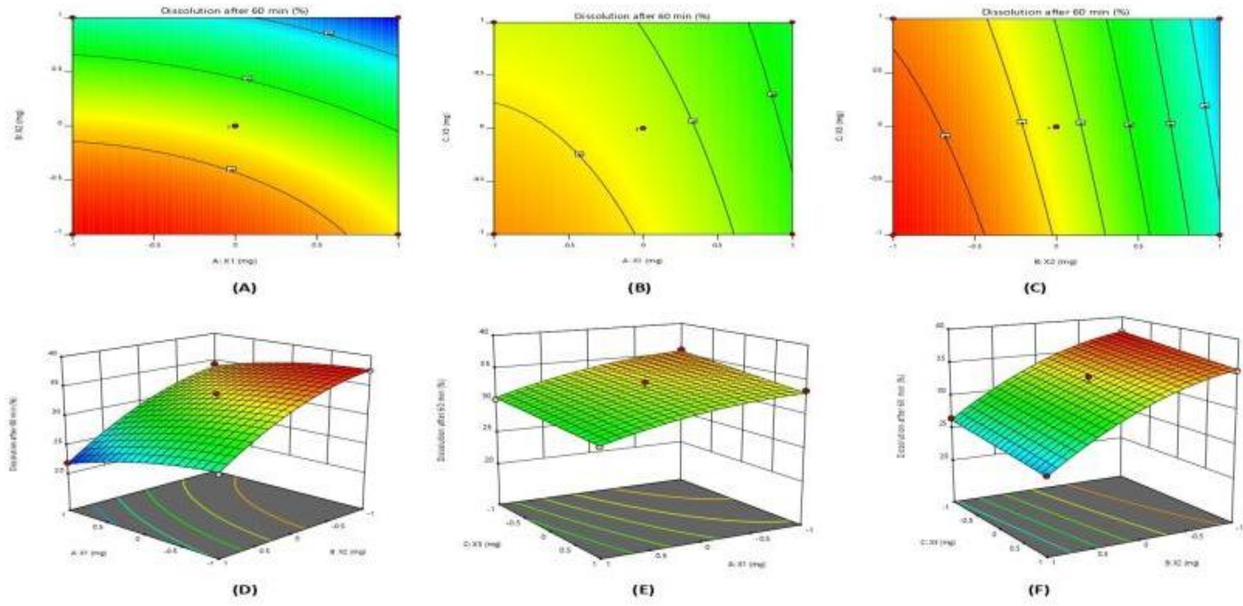

Figure1: Contour plot showing the effect of- (A) AFG (X1) and ATG (X2) on response Y2, (B) AFG (X1) and AXG (X3) on response Y2, (C) ATG (X2) and AXC (X3) on response Y2;
Response surface plot showing the effect of - (D) AFG (X1) and ATG (X2) on response Y2, (E) AFG (X1) and AXG (X3) on response Y2, (F) ATG (X2) and AXC (X3) on response Y2

Optimization:

The optimum formulation was selected based on the criteria of attaining the maximum hardness for tablets and applying constraints on Y1 ($10 \leq Y1 \leq 15$) and Y2 ($31 \leq Y2 \leq 35$). Upon 'trading off' various response variables and comprehensive evaluation of feasibility search and exhaustive grid search, the formulation composition with polymer levels of AFG- 37.40 mg, ATG- 10 mg and AXG- 24.91 mg, was found to fulfill the maximum requisite of an optimum formulation because of better regulation of % burst release and % dissolution after 1 hr time interval. The optimized formulation was found to release about 99.12% drug in sustained release manner for 12 hr. Study of the in vitro release profiles in 0.1 N HCl (for 2 hr) and in phosphate buffer, pH 6.8 (for 10 hr), of the formulations showed a burst release of 37.61% during 1 hr followed by a gradual release phase for about 10 hr. Figure 2 shows the complete dissolution profile of the optimized formulation. The optimization of the formulation was carried out from overlay plot. Overlay plot gives the area of interest or area of the experiment. In Figure 3 yellow region reflects the area of experiment.

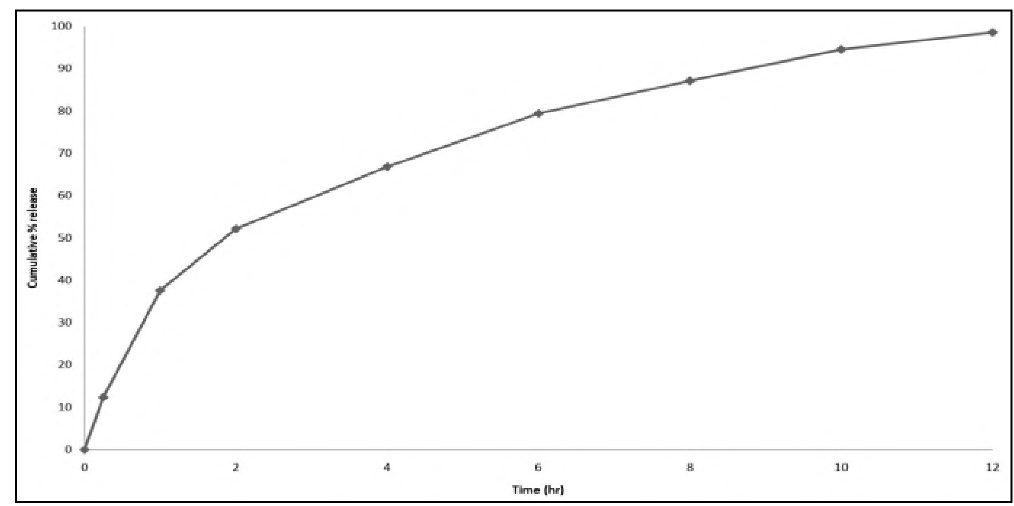

Figure 2: Dissolution profile of the optimized formulation.

Validation of RSM result:

For all of the checkpoint formulations, the results of the physical evaluation and tablet assay were found to be within limits. Table 6 shows the composition of optimum checkpoint formulations, their predicted and experimental values of all the response variables, and the percentage error in prognosis. Linear correlation plots between the actual and the predicted response variables were plotted and the residual plots, showing the scatter of the residuals versus actual values, are presented in Figure 4. For validation of RSM results, the experimental values of the responses were compared with that of the anticipated values and the prediction error was found to vary between 0.7533% and 0.9541%. The linear correlation plots drawn between the predicted and experimental values demonstrated high values of R^2 (ranging between 0.9300 - 0.9950) indicating excellent goodness of fit ($p < 0.001$) [26]. Thus the low magnitudes of error as well as the significant values of R^2 in the present investigation prove the high prognostic ability of the RSM [20].

Table 6: Composition of optimum checkpoint formulation, the predicted and experimental values of response variables and percentage prediction error

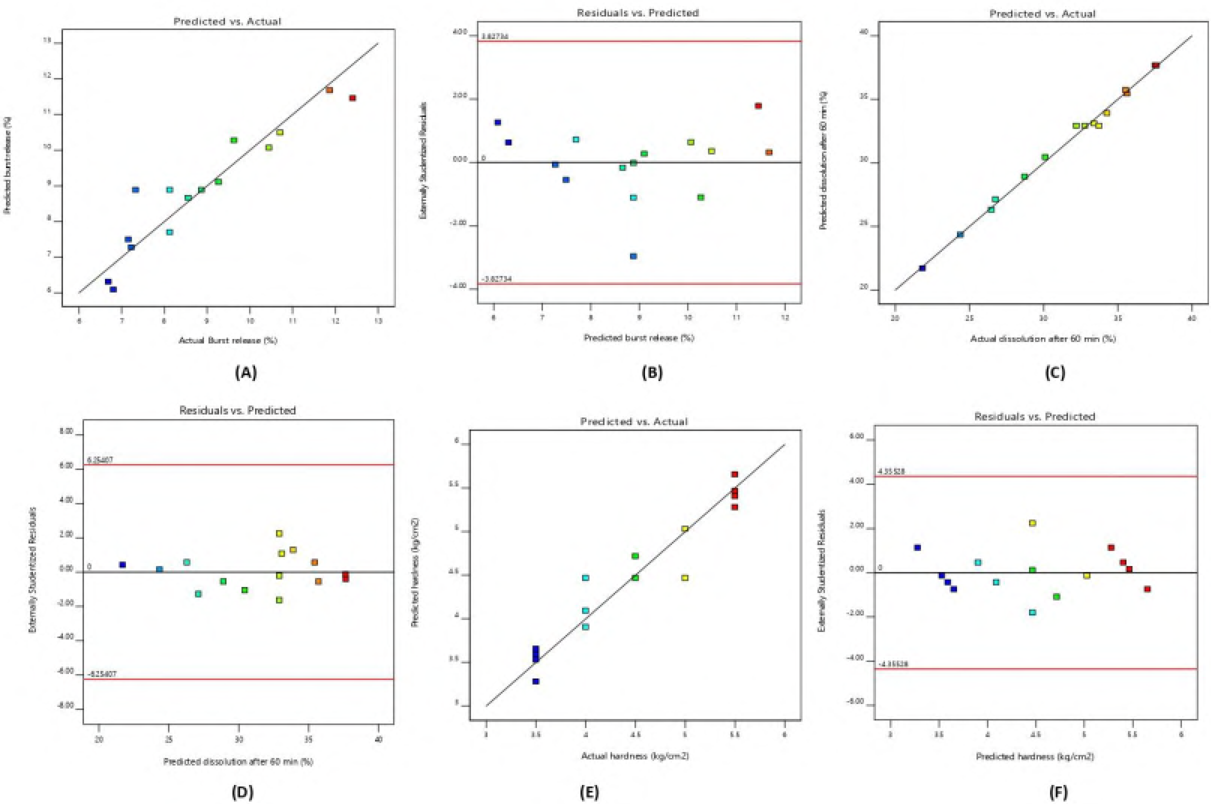

Figure 4: Linear correlation plots (A, C, E) between actual and predicted values and the corresponding residual plot (B, D, F) for various responses.

Swelling studies:

The swelling and erosion behavior of the optimized matrix tablet in 0.1N HCl and in PBS, pH 6.8, as a function of time, is shown in Figure 5. It can be observed that the hydrophilic matrix tablets underwent both swelling and erosion at the same time. The tablets achieved maximum swelling after 1 hr, which can be linked to the initial burst release of LP. Constant release can be obtained from such hydrophilic systems because of the simultaneous swelling and erosion of the matrix tablets. Constant release in such situations occurs because the increase in diffusional path length due to swelling is compensated by continuous erosion of the matrix. The cross-sectional SEM images of matrix tablets after 2 hr in acidic and 6 hr in basic media are shown in Figure 6 (A) (B). SEM study of the dissolving matrix tablets showed a uniform swelling of the matrix and further supported the fact of drug release by a diffusion process from the highly porous and swollen matrix tablets (figure 6).

Satara

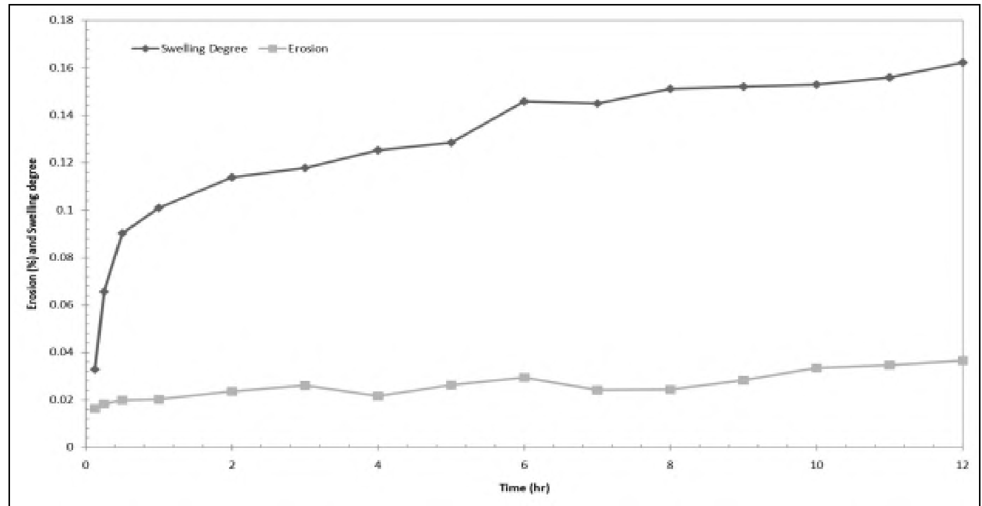

Figure 5: Erosion and swelling behavior of optimized formulation.

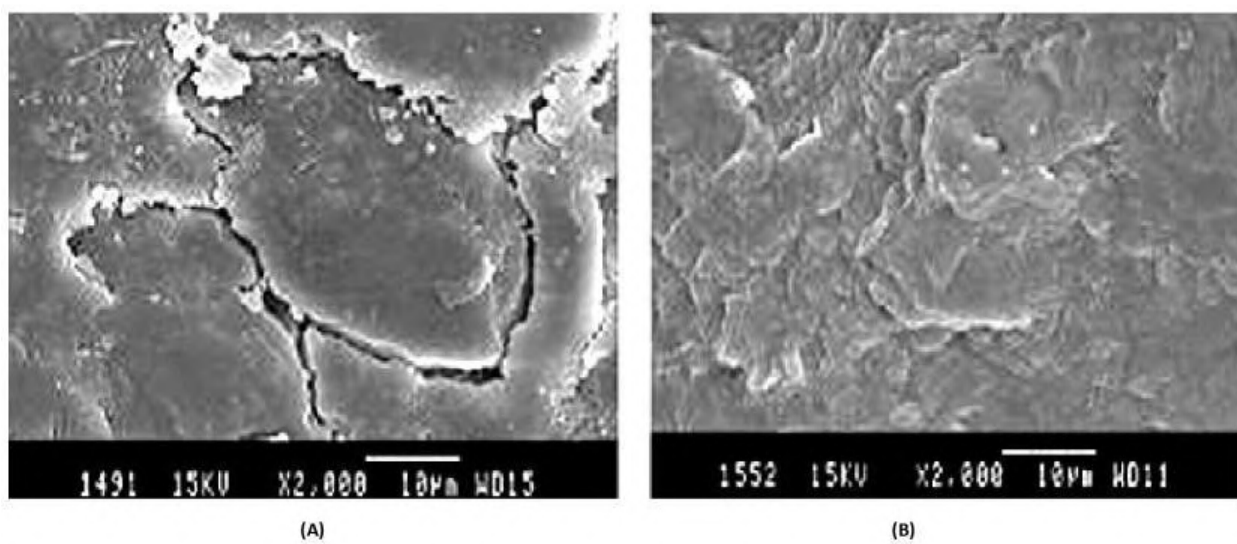

Figure 6: SEM photomicrographs showing surface topography of hydrated matrices in (A) acidic media, 2 hr (B) basic media, 6 hr.

Thermal properties:

DSC thermogram of the drug, excipients and the optimized formulation were recorded, in order to determine the thermal changes of polymers and drug before and after preparation. The characteristic endothermic peak of the drug at 255.46°C was observed in formulation also. However, the broadening of the drug peak in optimized formulation was related more to the impurities from excipients than physical interaction of the drug with the components.

Compatibility study of Losartan potassium by Fourier transform infrared (ATR-FTIR) spectroscopy:

FTIR spectra of the drug, excipients and the optimized formulation were recorded in range of 4000 – 400 cm^{-1}. LP showed some prominent and characteristic peaks at 3394 cm^{-1}, 1026 cm^{-1}, 1643 cm^{-1}, and 764 cm^{-1}, which could be assigned to stretching vibrations of O-H and C-O bond of primary alcohols, N=N stretching and C-Cl bond, respectively. In the optimized formulation, the presence of all the characteristic peaks of the LP indicates lack of any strong interaction between the drug and the excipients.

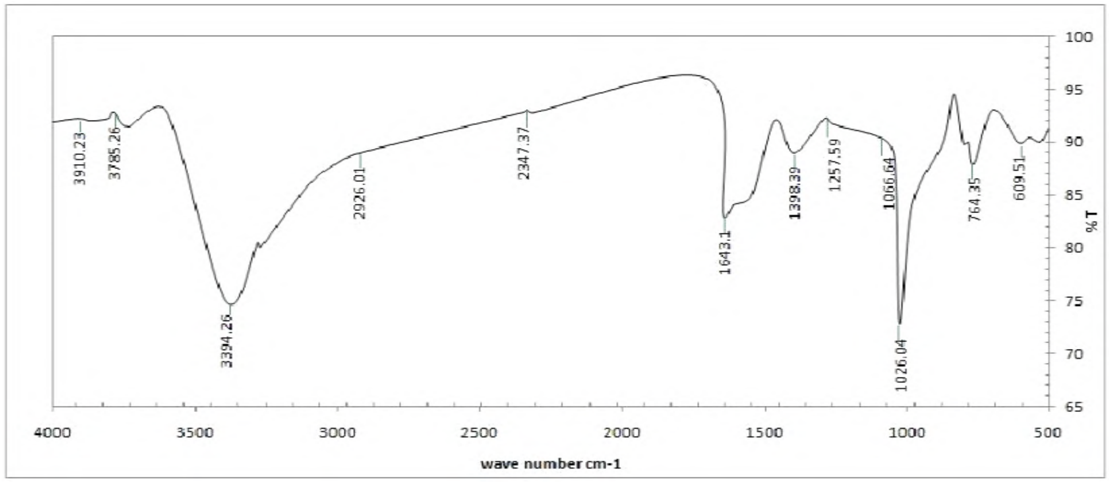

Figure 7: FTIR spectra of optimized formulation

CONCLUSION:

Release modifier polymer aminated fenugreek gum, aminated tamarind gum and aminated xanthan gum was synthesized and characterized. The synthesis polymers are characterized using ATR-FTIR, DSC and XRD studies. In this study, synthesis polymers are confirmed by ATR-FTIR study. The ATR- FTIR study of aminated fenugreek gum, aminated tamarind gum and aminated xanthan gum is confirmed by the appearance of a new peak at 3271 cm^{-1}, 1639.49 cm^{-1} and 2899.01 cm^{-1} respectively corresponding to NH2 group in the FTIR spectra of aminated fenugreek gum. Hydrophilic matrix tablets of LP with AFG, ATG and AXG were prepared and optimized using a three factor, three-level Box Behnken design. The quantitative effect of these factors at different levels on the release rate could be predicted by using polynomial equations. Linearity observed between the actual and predicted values of the response variables suggested the prognostic ability of the RSM design. The quadratic response surface methodology studied for the release rate helped in understanding the interaction effects between the combination and ratio of the three polymers. DSC and FTIR studies combined with the stability study of the optimized formulation proved the integrity of the developed hydrophilic matrix tablets. Thus, high degree of prediction obtained using RSM is quite efficient in optimizing drug delivery systems that exhibit non-linearity in responses.

ACKNOWLEDGEMENT:

Shankar Kalbhare would like to thank the Viraj Pharmaceutical, Mumbai (India) for providing gift sample of pure losartan potassium.

CONFLICT OF INTEREST:

ABSTRACT:
As the world scrambles to find a cure for COVID-19, Medical research network around the world is trying to find out treatment against the novel corona virus infection. In this pandemic condition there is a need for herbal remedies to boost the innate and acquired immunity to fight against corona virus. There are other certain ways to boost the "Immune System" such as active lifestyle, healthy diet, physical exercise, relaxation and sound sleep. Home remedies can be played a vital role as immunity modulator. Ayurveda treatises have described several herbal drugs which are used as different home remedies and are assume to be effective in COVID-19 therapeutics and immunity modulator as a preventive solution. That's why in this present study, an challenge is made to review such herbal drugs and identify its immune modulator effect against corona virus. Tulsi, Ginger, Clove, Dalchini, Turmeric, Garlic, Marich are most effective herbal drugs used as a home remedies to improve the immunity level naturally with speedy recovery in COVID-19 cases.

KEYWORDS: Covid-19, Immunity, Herbal drugs.

INTRODUCTION:

COVID-19, a global pandemic declared by WHO, is a highly infectious and severe acute respiratory disorder caused by a pathogenic virus called SARS-CoV-2 which is transmitted to humans via contact and feeding on infected animals. The COVID-19 clinical manifestations are very similar to viral pneumonia such as fever, fatigue, cough, shortness of breath, and other complications. According to reports obtained on WHO and NCDC websites as of 12th July 2020, the coronavirus breakout in Wuhan, a city in Hubei Province of China in November 2019 as spread to more than 200 countries in the world. This global pandemic has forced many nations to lock down their social activities which in turn have adverse effects on the economy[1].

Coronaviruses belong to the subfamily Coronavirinae in the family Coronaviridae of the order Nidovirales and can cause respiratory, digestive, and nervous system diseases in humans and many other animals[2].

DOI: 10.52711/2231-5691.2021.00037

Which consists of four genera namely: Alpha, Beta, Gamma, and Delta coronavirus. It is currently thought that, SARS-CoV-2 has azoonotic origin and has secondarily acquired human-to-human spreading capacity. In particular, the acquisition of 1)Mutations in the receptor-binding area, 2) A polybasic furin cleavage site (RRRAR)at the junction of subdomain 1 and 2 of the spike protein and 3) A site of O-linked glycosylation in the same area, have enabled the virus to efficiently interact with high affinity(via its spike protein) with its bona fide cellular receptor (angiotensin-converting enzyme 2[ACE-2]), to become more virulent and pathogenic, while potentially evading immune responses through O-glycan epitope maskimg[3].

Morphology and genomic structure of HCoV:

Coronaviruses are spherical or pleomorphic, with diameter of 80-120nm. The virion surface is decorated with club like projections constituted by the trimeric spike (S). The viral envelop is supported by the membrane (M) proteins the most abundant structural protein. And a small transmembrane protein known as the envelop (E) protein is also present in a low amount in the envelope. The genomic RNA and phosphorylated

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

nucleocapsid (N) protein form a spiral nucleocapsid, which is located within the envelope. The coronavirus genome is comprised of a single-stranded positive-strand RNA ranging from 27 Kb to 32 Kb in length. The genomic RNA is 5'-capped and 3'-polyadenylated and contains multiple open reading frames (ORFs). The invariant gene order is 5'- replicase-S-E-M-N-3', with numerous small ORFs (encoding accessory proteins) scattered among the structural genes[4].

Entry mechanism of human coronaviruses:

The life cycle of SARS-CoV-2 in host cells- begins when S protein binds to the cellular receptor ACE2. After receptor binding, the conformation change in the S protein facilitates viral envelope fusion with the cell membrane through the endosomal pathway. Then SARS-CoV-2 releases RNA into the host cell. Genome RNA is translated into viral replicase polyproteins pp1a and 1ab, which are then cleaved into small products by viral proteinases. The polymerase produces a series of subgenomic mRNAs by discontinuous transcription and finally translated into relevant viral proteins. Viral proteins and genome RNA are subsequently assembled into virions in the ER and Golgi and then transported via vesicles and released out of the cell[5].

Symptoms and effects of covid-19:

An infected COVID-19 patient can have two major states of infection, the asymptomatic state, and the symptomatic state. The symptomatic stage can develop into Acute Respiratory Disease Syndrome (ARDS) then rising infection can lead to multi- organ failure which can be fatal to the patient. An asymptomatic patient does not exhibit any symptoms of the disease due to high immunity but is still capable of infecting others, his state is extremely dangerous for the community and transmission of the virus. It is impossible to identify an asymptomatic patient without conducting an RT-PCR (Real-time polymerase chain reaction) test. Symptomatic patients exhibit varying level of severity of the disease, most patients display mild symptoms only like fever, cough, sore throat, headache, myalgia or severe symptoms like ARDS or organ failure. In the case of COVID-19, an extreme rise in inflammatory cytokines, monocytes, etc. leads to vasodilation. Which leads to the symptoms including shortness of breath, rapid breathing and bluish skin coloration[6].

Prevention:

The prevention and management are very important issues to control COVID-19. Therefore, there is a great need for the collective efforts of the public and the government. The regular and the proper care of the homes and hospitals are very important to control this calamity. The hand cleaning with soap and sanitizer, mouth and nose coverage with mask during sneezing and coughing are essential. Touching specific parts of the face like eyes, nose, and mouth without washing the hands should be avoided as these are entry points for the virus. Avoiding person-to- person contact. Regular cleaning of the surface by the disinfectants may control the virus outbreak. It is always better to avoid the interactions with anyone; suspecting respiratory problems symptoms like sneezing, coughing, breathing problem, etc. Screening has a vital role as a preventative measure to detect a potential health problem in an individual who doesn't have any signs and symptoms. Screening should be done in a multiphase level to aid further management of the disease[7].

Immunity:

The immune system refers to a collection of cells and proteins that function to protect the skin, respiratory passages, intestinal tract and other areas from foreign antigens, such as microbes (organisms such as bacteria, fungi, and parasites), viruses, cancer cells, and toxins. The immune system can be simplistically viewed as having two "lines of defense": innate immunity and adaptive immunity. Innate immunity represents the first line or defense to an intruding pathogen. It is an antigen-independent (non-specific) defense mechanism that is used by the host immediately or within hours of encountering an antigen. The innate immunity response has no immunologic memory and, therefore, it is unable to recognize or "memorize" the same pathogen should the body be exposed to it in the future. Adaptive immunity, on the other hand, is antigen- dependent and antigen-specific and, therefore, involves a lag time between exposure to the antigen and maximal response. The hallmark of adaptive immunity is the capacity for memory which enables the host to mount a more rapid and efficient immune response upon subsequent exposure to the antigen. Innate and adaptive immunity are not mutually exclusive mechanisms of host defense, but rather are complementary, with defects in either system resulting in host vulnerability[8].

Immunomodulators:

An immunomodulator may be defined as a substance, biological or synthetic, which can stimulate, suppress or modulate any of the components of the immune system including both innate and adaptive arms of the immune response. modulation of the immune system denotes to There are generally of two types immunomodulators based on their effects: immune suppressants and immune stimulators. Specific immunomodulators administered together with antigens to boost the immune response to the vaccine constituents. For instance, a planet origin saponin used in veterinary medicine. Whereas, non-specific immunostimulators offer a generalized state of resistance to pathogens or tumors. The concept of immunomodulation relates to nonspecific activation of the function and efficiency of macrophages, granulocytes, complement, natural killer cells and

DIRECTOR
Yashoda Technical Campus
Satara

lymphocytes and also to the production of various effectors molecules generated by activated cells. It is expected that theses nonspecific effects give protection against different pathogens including bacteria, viruses, fungi etc. and constitute an alternative to conventional chemotherapy[9].

Our body temperature and wealth of nutrients provide an ideal home for these micro-organisms to thrive. The human immune system comprises innate and acquired immunity. Natural killer (NK) cells, complement system, macrophages, antigen presenting cells (APCs) and neutrophils make up the innate immune system and mounts an immediate non-specific response to foreign microbial agents. If microbes by-pass this primary defence, the acquired immune response, comprising humoral and cell mediated components, will then act to contain the invaders. The type of antigen (fungi, virus, bacteria, toxin) processed and presented by APCs to the CD4+ T cell determines the type of cytokines secreted, which in turn, determine the differentiation of helper T (TH) cells into TH1 or TH2 cells and B-cells to give immunoglobulin sub- types. TH1 response involves the activation of macrophages, which contain and destroy mycobacteria and fungal fungal pathogens. TH1 pathway also activates cell-mediated immunity. TH2 cells, on the other hand, effect immunoglobulin differentiation and antibody secretion, and therefore mediate humoral immunity. CD8 cytotoxic T cells induce apoptosis in antigen-laden cells[9].

Ayurveda purview:

Ayurveda is a comprehensive scientific medicinal system indigenous to India. The term Ayurveda means ‘knowledge of life’. Which comprises two Sanskrit words, Ayu (life) and Veda (knowledge or science). Four Vedas, considered as a the oldest Indian literature (5000-1000 BC) contain information about natural remedies. Ayurveda was established as fully grown medicinal system. Charaka Samhita (focussing on internal medicine) and Susruta Samhita (focussing on surgery) were written systematically and considered as classical text of Ayurveda. Vital details of Charaka Samhita and Susruta samhita were compiled together and updated additionally in Astanga Sangraha and Astanga Hrdaya. Some other ancient classics which include minor work of Ayurveda includes Madhava Nidana (focusing on diagnosis of disease), Bhava Prakasa (focussing on additional information related to plant and diet), arngadhara Samhita (focusing on formulation and dosage form). Ayurveda was divided into eight major clinical subdivisions-Kayacikitsa (internal medicine), Salya Tantra (surgery), salakya (diseases of supra- clavicular origin), Kaumarabhrtya (paediatrics, obstetrics and gynaecology), Bhutavidya (psychiatry), Agada Tantra (toxicology), Rasayana Tantra (rejuvenation and geriatrics), Vajikarana (aphrodisiology and eugenics)[10].

Concepts underpinning ayurvedic medicine:

The 3 basic principles, called doshas (vata, pitta, and kapha), are derived from 5 elements of Indian philosophy. Ayurveda’s doshas can be identified as regulatory control factors for fundamental physiologic processes in living systems that maintain their identity throughout biologic history: vata and its subdoshas regulating input/output processes and motion; pitta and its subdoshas regulating throughput, turnover, and hence energy; and kapha and its subdoshas regulating storage, structure, and lubrication. Factors such as food, activity, the climate and stress can, however, disrupt or destroy these functions. Ayurveda seeks to normalize body functions with varied techniques including advice onfood and activity, internal herbal preparations, purification treatments (panchakarma), and surgical methods (shalya chikitsa). Oral administration routes play a major role in influencing individuals’ doshas, via the ingestion of food, spices, and medicinal plants. These elements are influencing doshas in different ways: stabilizing, disturbing, and supporting the body’s healthy state[11].

Role of herbal drugs as immunity booster:

Plants are always the key source of drug or treatment strategy in different traditional medicinal systems. In recent years, many people are choosing to plant based medicines or products to improve their health conditions or as curative substance either alone or in combinations with others. According to the WHO, herbs or herbal products are used by the large number of populations for basic healthcare needs. Herbal medicine includes herbs, herbal materials (like plant parts) or preparations, processed and finished herbal products, active ingredients[10].

1. Tulsi:

Many in-vitro, animal and human experimental scientific studies showed that; due to presence of eugenol, phenolic compounds, linoleic acid, etc. compounds Tulsi has antimicrobial (including antibacterial, antiviral, antimalarial), anti-diarrheal, anti-oxidant, anti-inflammatory, hepatoprotective, cardioprotective, reno-protective, analgesic, antipyretic, immunemodulatory properties and is thus recommended as a treatment for a range of diseases including features like cough, fever, asthma, anxiety, diarrhea, gastric, cardiac and genitourinary disorders. Due to its anti-inflammatory and antioxidant properties, it protects against toxic chemical-induced injury, enhance the antioxidant enzymes and protect cellular organelles and membranes by clearing damaged free radicals. The compounds such as ursolic acid, carnosol, rosmarinic acid, cirsilineol, apigenin, eugenol, and cirsimaritin present in O. sanctum increase haemoglobin concentration, enhance SRBC agglutinin titers, decrease cyclo-oxygenase (CoX)-2 and lipoxygenase (LOX)-5 enzymes activity, suppress NF-

DIRECTOR
Yashoda Technical Campus
Satara

kB classical pathway, up regulation of IL-2, IFN-g and TNF-a, down regulation of IL-1b and produce of SRBC antigen-specific antibodies, which represent a major defense mechanism to assess T-cell-dependent antibody responses i.e. Tulsi by enhancing immune response boost the defense mechanism against the infection. Several studies have shown that Tulsi (aqueous and methanol extract of leaf and seed oil) besides improving vital capacity also is an immune-modulator and regulator as it enhances immune response by increasing T-helper and NK cells; phagocytic activity and index with the rise in lymphocyte count, neutrophil count and antibody titer [12].

2. Ginger:

Ginger is the rhizome of Zingiber officinale Roscoe in the family Zingiberaceae and has been used as a food, spice, supplement and flavoring agent and in traditional medicines for more than 3000 years in countries. Ginger has been used in traditional medicines to treat diseases and symptoms, such as colds, headache, nausea, upset stomach, diarrhea, arthritis and rheumatism, or used as a carminative, antiflatulent and digestant. Furthermore, ginger is known to have pharmacological activity against natural, chemical and radiation-induced toxicities, such as radioprotective, hepatoprotective, nephroprotective, neuroprotective, gastroprotective and reproductive-system-protective effect. The bioactive compounds of ginger such as nevirapine, b-sitosterol, 6 gingediol, germacrene, methyl-6-shogaol, 6-gingerol, a-linalool, 6-shogaol, gingerdion, zingiberene, etc., are known to inhibit viral replication; among these the most potent inhibitors of reverse transcriptase (RT) enzyme is b-sitosterol, which is predicted to be used as non nucleoside reverse transcriptase (NNRTIs) HIV-1 inhibitors. It is reported that Ginger contains TNF-a which is also known as an anti-influenza cytokine.The rhizome of Ginger and its main components like gingerols, shogaols, etc inhibit prostaglandin and leukotriene biosynthesis, inhibit cyclooxygenase and lipoxygenase activities, inhibits the synthesis of pro-inflammatory cytokines such as IL-1, TNF-a, and IL-8 without any significant effect in IL-6 levels; inhibit the excessive production of NO, PGE (2), TNF-a, and IL-1beta, reduce the elevated expression of NFkB and TNF-a, downregulate inflammatory iNOS and COX-2 gene expression, inhibit thromboxane synthetase, raise levels of prostacyclin without a concomitant rise in PGE 2 or PGE 2 alpha, inhibit platelet aggregation, decrease age-related oxidative stress markers and enhance

Fibrinolysis. The concentration of IgM and eosinophil count in non-smokers was significantly increased in a comparative study of the effect of ginger extract among male smokers and non-smokers, whereas the concentration of hemoglobin and lymphocyte count in smokers was strongly increased. This indicates that in non-smokers, ginger results in a stronger antibody response or humoral immunity than in smokers[12].

3. Clove:

Cloves are an aromatic herb that has many useful purposes. Approximately, 72-90% of the essential oil extracted from cloves has Eugenol. Other are Acetyl eugenol, Beta-caryophyllene and vanillin, Crategolic acid, tannins, gallotannic acid, methyl salicylate (painkiller), Flavonoids eugenin, kaempferol, Triterpenoids like oleanolic acid. The dried buds of cloves contain antiseptic, and anti-fungal agent. It also holds aphrodisiac and circulation-stimulating capacities. The oil of cloves has been used in a variety of health conditions including indigestion, generalized stress, parasitic infestations, cough, toothaches, headache, and blood impurities. Clove is used extensively in dental care for relieving toothache, sore gums and oral ulcers. Gargling with clove oil can also aid in sore throat conditions and bad breathe. Clove oil clears the respiratory passages, acting as an expectorant for treating many upper-respiratory conditions including colds, bronchitis, sinus conditions, cough and asthma. Not only purifies the blood, but also aids in stabilizing blood sugar levels, and may have benefits for diabetic individuals. Clove's antiviral and cleansing properties purify the body, augmenting our resistance to disease[13-16].

4. Dalchini:

The Cinnamon popularly known as Dalchini (Cinnamomum zeylanicum), belongs to the family Lauracae. Cinnamon has also been used for its medicinal properties for thousands of years. Made from the inner bark of the cinnamomum tree, its use has been dated as far back as ancient Egypt. Cinnamon is an immune simulator, protecting the body from bacterial or viral attacks. It helps your body fight infections and repair tissue damage. All the antioxidants are super powerful when it comes to bringing those anti-inflammatory properties. Cinnamon also gives us manganese, calcium, fiber and iron. Cinnamon also fights inflammation and helps ward off infections and herbal damaged tissue. Containing large amounts of polyphenol, cinnamon outranked "superfoods" like garlic and oregano in a study comparing the antioxidant, antitumor, antihypertensive, antilipemic, antidiabetic, gastroprotective, and immunomodulatory effects[17]. In addition to being lipid lowering and cardiovascular-disease- lowering compound, cinnamon has also reported to have activities against neurological disorders, such as Parkinson's and Alzheimer's diseases. Cinnamon is a coagulant and prevents bleeding. Cinnamon also increases the blood circulation in the uterus and advance tissue regeneration[18].

In one study, cinnamon at high dose (100mg/kg) showed immuno-stimulant activity as it significantly increased

DIRECTOR
Yashoda Technical Campus
Satara

the phagocytic index, serum immunoglobulin levels and antibody titer and decreased the percentage reductions in neutrophil count. Cinnamon low dose (10mg/kg) increased serum immunoglobulin levels only. This showed that high dose increases both cell mediated and humoral immunity whereas low dose showed effect only on humoral immunity. The studies also suggest that cinnamaldehyde can act as a strong regulator of monocyte/macrophagemediated immune responses by inhibition of PI3K, PDK1 and NF-kB activation of signaling components. In addition to this, by the activation of CD29 and CD43, it blocked cell migration cellecell adhesion induced but not cell-fibronectin adhesion and it was able to suppress both the production of nitric oxide (NO) and up regulation of surface levels of co-stimulatory molecules (CD69 and CD80) and pattern recognition receptors (TLR2 and CR3).

5. Turmeric:

Turmeric (Curcuma longa), also known as “Indian saffron” due to its brilliant yellow colour, is a spice herb, member of the ginger family (Zingiberaceae) native to the Indian subcontinent and Southeast Asia, having more than a two centuries old scientific history. Turmeric obtained from ground-dried root contains different percentages of volatile and non-volatile oils, proteins, fats, minerals, carbohydrates, curcuminoids and moisture. Commercially available curcumin is a combination of three molecules, together called curcuminoids. Curcumin is the most represented (60–70%), followed by demethoxycurcumin (20–27%) and bisdemethoxycurcumin (10–15%). Besides curcuminoids, the other active components of turmeric include sesquiterpenes, diterpenes, triterpenoids[19].

Turmeric has various useful properties with antioxidant activities. Turmeric has anti-inflammatory, anticancer, anti-diabetic, hypolipidemic, antimicrobial, anti- fertility, anti-venom, hepatoprotective, nephroprotective, anticoagulant property. The plant has also shown to possess anti HIV activity to combat AIDS[17]. The immunomodulatory abilities of curcumin arise from its interaction with various immunomodulators, including not only cellular components, such as dendritic cells, macrophages and both B and T lymphocytes, but also molecular components involved in the inflammatory processes, such as cytokines and various transcription factors with their downstream signalling pathways. Curcumin supplementation in rabbit diet (2,4and 6g/kg) significantly increased serum levels of IgG and IgM, thus suggesting that curcumin can also improve immune response[20].

6. Garlic:

Garlic (Allium sativum) is bulbous perennial plant with a powerful onion such as aroma and pungent taste that has been used as flavoring agent, condiment, and for medicinal purposes for over 5,000 years. Garlic contains a variety of bioactive constituents includindg sulfur compounds such as alliin, allicin, ajoene, allylpropyl disulfide, diallyl disulfide (DADS), diallyltrisulfide (DATS), S-allylcysteine (SAS); peroxidases and alliniase like enzyme, amino acids and important trace elements like Se, Ge and Te. Garlic is frequently used to treat aches and pains, leprosy, diarrhea, infections, dandruff, respiratory disorders. Garlic has been employed for management of blood pressure, atherosclerosis, high cholesterol, heart attack and coronary heart disease. Aged garlic has more potent immunomodulatory effects than raw garlic. Garlic is an effective therapeutic candidate to prevent the recurrent aphthous ulcer. Conditions like gout, rheumatoid arthritis, osteoarthritis, diabetes, allergic rhinitis, traveler’s diarrhea, bacterial and fungal infections, cold and flu are also known to cured by garlic. Other uses of garlic include treatment of fever, whooping cough, headache, stomach ache, sinus congestion, psoriasis, hair loss and hemorrhoids[21].

7. Marich:

It has been also found to increase bioavailability, thus enhance the therapeutic efficacy of many drugs, vaccines and nutrients and have immune-modulatory, anti-oxidant, antiplatelets, antihypertensive, anti-asthmatic, antipyretic, analgesic, anti-carcinogenic, anti-inflammatory, anti-diarrheal, antispasmodic, anxiolytic, antidepressants, hepatoprotective, anti-ulcer, anti thyroids, antiapoptotic, anti-metastatic, antimutagenic, antibacterial, antifungal and anti-amoebic properties. The extract and its constituents like piperine, regulate the balance of the cytokines production of Th1, Th2, Th17, and Treg cells, reduce the accumulation of inflammatory cells, inhibit the expressions of GATA3, IL-4, IL-6, IL-1b, RORgt, IL-17A and TNF-a, increase INF-g and IL-10 secretions in BALF (Broncho-alveolar lavage fluid) and increase macrophage activation and T and B cell proliferation. Beside this, Marich possess cytotoxic activity, suppresses the levels of total IgE, anti-OVA IgE, anti-OVA IgG1 and histamine release in serum, ameliorates fibrosis and infiltration of inflammatory cells, inhibits the allergic responses, inhibitsTh2/Th17 responses and mast cells activation, inhibits NF-kB, c-Fos, cAMP response element-binding (CREB) and activated transcription factor (ATF-2); suppresses PMA-induced MMP-9 expression, inhibits PKCa/extracellular signal regulated kinase (ERK) 1/2 and reduces NF-kB/AP-1 activation. In addition, piperine also inhibits the Pglycoprotein (P-gp) and CYP3A4 functions. Piper nigrum is found to have dose dependent antifertility effects on mice[22].

CONCLUSION:

COVID-19 viral spectre outbreak is spreading across different countries at an increasingly alarming rate.

DIRECTOR

Currently, yet no any vaccine or medicine could be developed to cure COVID-19 and Scientist also utilizing hydroxychloroquine to treat COVID-19 but could not get positive response and has side effect. Immune systems in body play an important role to fight against unhealthy environment and microbes such as virus, bacteria, fungus etc. In the current pandemic infection of COVID-19 it is clear that those with weak immune system are highly susceptible to this infection and worst outcomes. In the case of infectious pandemics like this "prevention is always better than cure". In this regard immune enhancing herbs may definitely be helpful for the body to fight COVID-19 infection. Tulsi, Ginger, Clove, Dalchini, Turmeric, Garlic, Marich these botanical plants having low cost, minimum toxicity and almost found everywhere in country, it has potential to enhance immunity to fight against COVID-19 and other infectious disease and play an important role to becomes fit and healthy India and world.

REVIEW ARTICLE

Acute Toxicity study of Synthesized drug and Herbal Product

Tanuja Yadav*, Sachin Rohane
Faculty of Pharmacy, Yashoda Technical Campus, Satara 415015, India.
*Corresponding Author E-mail: **tanujayadav711@gmail.com**

ABSTRACT:
Acute toxicity study describes the adverse effects of a substance that result either from a single exposure or from multiple exposures in a short period of time. Whenever an investigator administered a chemical substance or herbal drug to a biological system different types of interactions can occur and a series of dose-related responses result. In most cases these responses are desired and useful, but there are a number of other effects which are not advantageous. These may or may not be harmful to the patient. Acute toxicity study is involved in estimation of LD_{50}. Also it determines the therapeutic index i.e ratio between the lethal dose and the pharmacologically effective dose in the same strain and species. This article Review the methods so for utilized for the determination of acute toxicity.

KEYWORDS: Acute toxicity study, Therapeutic index, Biological system.

INTRODUCTION:
The amount of pharmacological substances, chemical and herbal drugs being used in the human community today have increased to almost an innumerable amount. These may be presented today in the form or as constituents of food substances medicines, beverages, otherindustrial and household products. However these chemicals or herbal drug may result in chronic toxicity in the living system when used over a long period of time or acute toxicity may also occur when large quantities capable of eliciting immediate toxic effect are used. These effects may be mild or severe depending upon nature of the substance.

Acute toxicity is defined as the unwanted effect that occurs either immediate or at a short time interval after a single or multiple administration of such substance within 24 hours. The unwanted effect is any effect is any effect that produces functional impairments in organs and/or biochemical lesion which could alter the functioning of the organism in general or individual organs [1-2].

Accepted on 15.06.2021 ©Asian Pharma Press All Right Reserved
Asian J. Pharm. Res. 2021; 11(4):251-256.
DOI: 10.52711/2231-5691.2021.00044

Toxicity is the fundamental science of poisons. The organization for Economic and Development (OECD) mentioned acute toxicity as the advance effects occurring within short time of oral administration. Phychochemical interactions of poisons leads to the injury or death of living tissues. Toxicology is like science and an art like medicine. It includes observational data gathering and data utilization to predict outcome of exposure in human and animals. Acute toxicity is distinguished from chronic toxicity, which describes the adverse health effects from repeated exposures, often at lower levels to a substance over a longer time period [3-4].

Acute toxicity (LD_{50}) test:
Acute systemic toxicity evaluates the adverse effects that occur following exposure of organisms to a single or multiple doses of a test substance within 24 hours by a known route (oral, dermal or inhalation). After administration, the test substance is absorbed and distributed to various parts of the body before it elicits systemic adverse effect. The regulatory body requires the acute toxicity test report for labelling and classification of substances for human use.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

The LD_{50} (median lethal dose) test was introduced in 1927 by J.W. Trevan to estimate the dose of a test substance that produces 50% death in a given species of animals. It is usually the first test conducted for every chemical before further toxicity tests are carried out. It is used for estimating the potential hazards of chemicals on humans. Although its major endpoint is death, non-lethal acute effect may occur as sign of toxicity depending on the chemical being tested.

Assessment of the acute toxic potential of substances is required to determine their adverse effects that might occur due to accidental or deliberate short-term exposure. Result from acute toxicity test serve as a guide in dosage selection for long term toxicity studies are well as other studies that involve the use of animals.

From the result of an acute toxicity test, a conclusioncan be made on the toxicity status of the substance. As depicted in table 1, substance with LD_{50} below 5 mg/kg are classified to be highly toxic while substance with LD_{50} above 15,000 mg/kg are termed relatively harmless [5-8].

Table 1: Classification of LD_{50} based on dose range.

LD_{50}	Classification
<5 mg/kg	Extremely toxic
5-50 mg/kg	Highly toxic
50-500 mg/kg	Moderately toxic
500-5000 mg/kg	Slightly toxic
5000-50000 mg/kg	Practically non-toxic
>15000 mg/kg	Relatively harmless

OECD Guideline for Acute Oral Toxicity:

OECD Guideline for the testing of chemicals are periodically reviewed in the light of scientific progress or changing assessment practices.The conventional acute oral toxicity test (formerly OECD Test Guideline 401)is the most heavily criticized test in terms of animal welfare and this concern was the driving force behind the development of three alternative tests for acute oral toxicity (Test Guideline 420,423,425).Anticipating the presence of validated alternatives, Member countries took the initiative to plan the deletion of Guideline 401[9-12].

A Nominated Expert Meeting (Rome 1998) and an Expert Consultation Meeting, (Arlington 1999) were convened to determine the acute oral toxicity data requirement needs of Member countries and to assess the capabilities of the alternatives to meet these needs. On the basis of these technical discussions, the 29th Joint Meeting concluded in June 1999 that not all data needs could be met by the alternatives (and not always by Guideline 401). The Joint Meeting decided that Guidelines 420,423 and 425 should be revised to meet regulatory needs of member of countries.

The revision of Guidelines 420, 423, and 425 was completed in 2000 following a second Expert Consultation Meeting (Paris 2000) and process of deletion of guideline 401 was started[13-15].

OECD Guideline 420:
Acute Oral Toxicity-Fixed Dose Procedure:

The method provides information on the hazardous properties and allows the substance to be ranked and classified to the Globally Harmonised System (GHS) for the classification of chemicals which cause acute toxicity.

Principle of the test:

Group of animals of a single are dosed in a stepwise procedure using thefixed doses of 5, 50, 300 and 2000 mg/kg (exceptionally an additional fixed dose of 5000 mg/kg may be considered). The initial dose level is selected on the basis of a sighting study as the dose expected to produce some signs of toxicity without causing severe toxic effects or mortality. Further groups of animals may be dosed at higher or lower fixed doses depending on the presence or absence of signs of toxicity or mortality. This procedure continues until the dose causing evident toxicity or no more than one death is identified or when no effect are seen at the highest dose or when death occur at the lowest dose.

Description of the method:

1. **Selection of animal species:**

The preferredrodent species is the rat. Normally females are used. When the test is conducted in males, adequate justification should be provided. Females should be nulliparous an non pregnant. Each animal, at the commencement of its dosing, should be between 8 and 12 weeks old and its weight should fall in an interval within ± 20 % of the mean weight of any previously dosed animals.

2. **Housing and feeding condition:**

The temperature of the experimental animal room should be 22 c^0. Although the relative humidity should be at least 30% and preferably not exceed 70%.Lighting should be artificial ,the sequence being 12 hours light ,12 hours dark . For feeding, conventional laboratory diets may be used with an unlimited supply of drinking water.

3. **Preparation of animals:**

The animals are randomly selected, marked to permit individual identification and kept in their cages for at least 5 days prior to the start of dosing to allow for acclimatisation to the laboratory conditions.

4. **Preparation of doses:**

Test substances should be administer in a constant volume over the range of doses. In case of liquid end product or mixture is to be tested –use undiluted test

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

substance i.e at a constant concentration .In either case,the maximum dose volume for administration must not exceeded .In rodents , the volume should not normally exceed 1ml /100g of body weight however in case of aqueous solution 2ml/100g body weight can be considered. For vehicles other than water the toxicological characteristics of the vehicle should be known.

Procedure:

1. Administration of doses:

By gavage using a stomach tube or suitable incubation canula(unusual circumstance –fraction of doses).Fasted prior to dosing. Weigh animals and administer the test substance. Withheld food for a further 3-4 hours in rats or 1-2 hours in mice (in case of fraction of doses).

2. Sighting study:

The purpose of the sighting study is to allow selection of the appropriate starting dose for the main study. The substance is administered to single animals in a sequential manner following the flow charts.The starting dose for the sighting study is selected from the fixed dose levels of 5,50,300 and 2000 mg/kg as a dose expected to produce evident toxicity. Also, evidence from in vivo and in vitro data from the same chemical and from structurally related chemicals. In the absence of such information, the starting dose will be 300 mg/ kg. At least 24 hours will be allowed between the dosing of each animal. Consideration of use of an additional upper fixed dose level of 5000 mg/kg. In cases where an animal tested at the lowest fixed dose level (5 mg/kg) in the sighting study dies, the normal procedure is to terminate the study and assign the substance to GHS category. For further confirmation use supplementary procedure.

3. Main study:

Numbers of animals and dose levels

Select dose from sighting study. Perform study on a total of five animals of one sex at each level including animals tested in sighting study. Time interval between dosing at each level depends on onset, duration and severity of toxic signs. Treatment of animals at the next dose should be delayed until one is confident of survival of the previously dosed animals. To check delayed Toxicity-A period of 3 or 4 days between dosing at each dose level is recommended. In case of inconclusive response time interval may be adjusted as appropriate. Fixed dose of 5000 mg/kg procedure outline in Annex 4.

4. Limit test:

Performed when information indicating that the test material is likely to be nontoxic i.e. having toxicity only above regulatory limit doses. How information about the toxicity of the test material can be gained?. Using the normal procedure test will be done [16].

OECD Guideline 423:

Acute Oral Toxicity-Acute Toxic Class Method:

The acute toxic class method is based on biometric evaluation with fixed doses, adequately separated to enable a substance to be ranked for classification purposes and hazard assessment. The method as adopted in 1996 was extensively validated in vivo against LD_{50} data obtain from the literature, both nationally and internationally.

Principle of the test:

It is the principle of the test that, based on a stepwise procedure with the use of a minimum number of animals per step, sufficient information is obtained on the acute toxicity of the test substance to enable its classification. The substance is tested using a stepwise procedure, each step using three animals of a single sex. Absence or presence of compound-related mortality of the animals dosed at one step will determine the next step i.e.

- No further testing is needed,
- Dosing of three additional animals with the same dose.
- Dosing of three additional animals at the next higher or the next lower dose level.

Description of the method:

1. Selection of animal species:

The preferred rodent species is the rat. When the test is conducted in males adequate justification should provided. Healthy young adult animals of commonly used laboratory strains should be employed. Females should be nulliparous and non-pregnant. Each animal, at the commencement of its dosing, should be between 8 and 12 weeks old and its weight should fall in an interval with in ±20%of the mean weight of any previously dosed animals.

2. Housing and feeding conditions:

The temperature in the experimental animal room should be 22^0C. Although the relative humidity should be at least 30% and preferably not exceed 70%. Lighting should be artificial, the sequence being 12 hours light, 12hours dark for feeding conventional laboratory diets may be used with an unlimited supply of drinking water.

3. Preparation of animals:

The animals are randomly selected, marked to permit individual identification, and kept in their cages for at least 5 days prior to dosing to allow for acclimatization to the laboratory conditions.

4. Preparation of doses:

Test substances should be administer in a constant volume over the range of doses. In case of liquid end product or mixture is to be tested-use undiluted test substance i.e. at a constant concentration. In either case,

6757
SATARA
DIRECTOR
Yashoda Technical Campus
Satara

the maximum dose volume for administration must not exceeded. In rodent, the volume should not normally exceed 1 ml/100 g of body weight however in case of aqueous solution 2 ml/100 g body weight can be considered. For vehicles other than water the toxicological characteristics of the vehicle should be known.

Procedure:

1. Administration of doses:

The test substance is administered in a single dose by gavage using a stomach tube or suitable intubation canula. Single dose is not possible, the dose may be given in smaller fractions over a period not exceeding 24 hours. Animal should be fasted prior to dosing. Following the period of fasting, the animals should be weighed and the test substance administered. After the substance has been administered, food may be withheld for a further 3-4 hours in rats or 1-2 hours in mice.

2. Number of animals and dose levels:

Three animals are used for each step. The dose level to be used as the starting dose is selected from one of four fixed levels 5, 50, 300 and 2000 mg/kg body weight. The starting dose level should be that which is most likely to produce mortality in some of the dosed animals. The flow charts of Annex 2 describe the procedure that should be followed for each of the starting doses.

When available information suggests that mortality is unlikely at the highest starting dose level, then a limit test should be conducted. When there is no information on a substance to be tested, for animal welfare reasons it is recommended to use the starting dose of 300 mg/kg body weight.

The time interval between treatment groups is determined by the onset, duration, and severity of toxic sighs. Treatment of animals at the next dose, should be delayed until one is confident of survival of the previously dosed animals. Exceptionally, and only when justified by specific regulatory needs, the use of additional upper dose level of 5000 mg/kg body weight may be considered.

3. Limit test:

The limit test is primarily used in situations where the experimenter has information indicating that the test material is likely to be nontoxic i.e. having toxicity only above regulatory limit doses. Information about the toxicity of the test material can be gained from knowledge about similar tested compounds or similar tested mixtures or products, taking into consideration the identity and percentage of components known to be of toxicological significance. In those situation where there is little or no information about its toxicity, or in which the test material is expected to be toxic, the main test should be performed.

A limit test at one dose level of 2000 mg/kg body weight may be carried out with six animals. Exceptioally a limit test at one dose level of 5000 mg/kg may be carried out with three animals. If test substance-related mortality is produced, further testing at the next lower level may need to be carried out [17].

OECD Guideline 425:

Acute Oral Toxicity: Up and Down procedure-

This test procedure is of principal value in minimising the number of animals required to estimate the acute oral toxicity of a chemical and in estimating a medium lethal dose. The medium lethal dose allows for comparison with historical data. In addition to the observation of mortality, LD_{50} allows the observation of signs of toxicity. The latter is useful for classification purpose and in the planning of additional toxicity tests.

Principle of the test:

Animals are dosed, one at a time, at 24 hours intervals. The first animal receives a dose at the level of the best estimate of the LD_{50}. Depending on the outcome for the previous animal, the dose for the text animal is adjusted up or down. If an animal survives, the dose for the next animal is increased; if it dies, the dose for the next animal is decreased. After reaching the reversal of the initial outcome i.e. the point where an increasing dose pattern is reversed by giving a smaller dose, four additional animals are dosed following the same UDP. The LD_{50} is calculated using the method of maximum likelihood.

Description of the method:

1. Selection of animal species:

The preferred rodent species is the rat. In the normal procedure female rats are used. When there is adequate information to infer that males are more sensitive, they should replace females in the test. The females should be nulliparous and non-pregnant. At the commencement of the study, the weight variation of the animals should be minimal and not exceed ±20% of the mean weight for each sex. The test animals should be characterised as to species, strain source, sex, weight and age.

2. Housing and feeding conditions:

The temperature in the experimental animal room should be 22^0 C. Although the relative humidity should be at least 30% and preferably not exceed 70%. Lighting should be artificial, the sequence being 12 hours light and 12 hours dark. For feeding conventional laboratory diets may be used with an unlimited supply of drinking water.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

3. Preparation of animals:

The animals are uniquely identified and kept in their cages for at least five days prior to dosing for acclimatisation to the laboratory conditions. Animals demonstrating signs of spontaneous disease or abnormality prior the start of the study are eliminated from the study.

4. Preparation of doses:

When necessary, the test substance is dissolved or suspended in a suitable vehicle. It is recommended that, whenever possible, the use of an aqueous solution or suspension be considered first, followed by consideration of a solution or emulsion in oil and then by possible solution in other vehicle. For vehicles other than water, toxicity of the vehicle must be known.

Procedure:

1. Full test:

Individual animals are dosed in sequence at 24 h intervals, one at time and then observed for a minimum of 24 h. However, the time intervals between dosing should not be fixed rigidly and may be adjusted as appropriate, in case of delayed mortality. The first animal is dosed at the toxicologist's best estimate of the LD_{50}. If the animal survives, the second animal receives a higher dose, unless the limit dose was used as the starting dose. If the first animal dies or appears moribund the second animal receives a lower dose. Moribund state is characterised by symptoms such as shallow, laboured or irregular respiration, muscular weakness or tremors, absence of voluntary response to external stimuli, cyanosis and coma, Criteria for making the decision to humanely kill moribund and severely suffering animals are the subject of a separate Guidance Document. Animals killed for humane reasons are considered in the same way as animals that died on test.

For selecting the starting dose, all available information should be used, including information on structure-activity relationships. When the information suggests that mortality is unlikely then a limit test should be conducted. When there is no information on the substance to be tested, for animal welfare reasons it is recommended to use the starting dose of 200 or 500 mg/kg body weight. The dose for each successive animal is adjusted up or down, depending on the outcome of the previous animal. If feasible, a dose progression factor of 1.3 is used. Other factors may be used, if justified. After reaching the reversal of the initial direction, four additional animals are dosed using the same UDP. This is the end of the normal test.

2. Limit test:

Doses should not exceed 2000 mg/kg which is considered the upper limit dose. When the first animal is dosed with the upper limit dose and survives, the second animal receives the same dose. When total of three animals have been dosed with the limit dose and no deaths have occurred, then three animals of the other sex should be tested at the limit dose level. If there is again no lethality, the test can be terminated.

3. Optional testing:

Information from one sex may be adequate toxicity. However, if found desirable, comparability of response in the other sex can be evaluated by administering to generally not more than 3 animals, dose above and below the estimated LD_{50}. The point intermediate between doses where responses change can be taken as an appropriate estimate of the lethal dose.

4. Administration of doses:

The test substance is administered in a single dose by gavage, using an oral dosing needle or rubberised tubing. The animal should be fasted prior to dosing by withholding food overnight. Fasted body weight of each rat is determined and the dose is calculated according to the body weight. After dosing food may be withheld for a further 3-4 hours. The volume should not exceed 1 ml/100g body weight, except in the case of aqueous solutions where 2ml/100g body may be used[18].

CONCLUSION:

In acute toxicological study, the investigational product is administered at different dose levels, and the effect is observed for 14 days. All mortalities caused by the investigational product during the experimental period are recorded and morphological, biochemical, pathological, and histological changes in the dead animals are investigated. Acute toxicity study is involved in estimation of LD_{50} and also it is useful to determine the absolute dose given to the species in a row was multiplied by the factor given at intersection of the relevant row and column. OECD Guideline 420, OECD Guideline 423 and OECD Guideline 425 these methods are used to determine acute oral toxicity of chemical substance and herbal products.

ABSTRACT:
Acute toxicity study describes the adverse effects of a substance that result either from a single exposure or from multiple exposures in a short period of time. Whenever an investigator administered a chemical substance or herbal drug to a biological system different types of interactions can occur and a series of dose-related responses result. In most cases these responses are desired and useful, but there are a number of other effects which are not advantageous. These may or may not be harmful to the patient. Acute toxicity study is involved in estimation of LD_{50}. Also it determines the therapeutic index i.e ratio between the lethal dose and the pharmacologically effective dose in the same strain and species. This article Review the methods so for utilized for the determination of acute toxicity.

KEYWORDS: Acute toxicity study, Therapeutic index, Biological system.

INTRODUCTION:
The amount of pharmacological substances, chemical and herbal drugs being used in the human community today have increased to almost an innumerable amount. These may be presented today in the form or as constituents of food substances medicines, beverages, otherindustrial and household products. However these chemicals or herbal drug may result in chronic toxicity in the living system when used over a long period of time or acute toxicity may also occur when large quantities capable of eliciting immediate toxic effect are used. These effects may be mild or severe depending upon nature of the substance.

Acute toxicity is defined as the unwanted effect that occurs either immediate or at a short time interval after a single or multiple administration of such substance within 24 hours. The unwanted effect is any effect is any effect that produces functional impairments in organs and/or biochemical lesion which could alter the functioning of the organism in general or individual organs [1-2].

Toxicity is the fundamental science of poisons. The organization for Economic and Development (OECD) mentioned acute toxicity as the advance effects occurring within short time of oral administration. Phychochemical interactions of poisons leads to the injury or death of living tissues. Toxicology is like science and an art like medicine. It includes observational data gathering and data utilization to predict outcome of exposure in human and animals. Acute toxicity is distinguished from chronic toxicity, which describes the adverse health effects from repeated exposures, often at lower levels to a substance over a longer time period[3-4].

Acute toxicity (LD_{50}) test:
Acute systemic toxicity evaluates the adverse effects that occur following exposure of organisms to a single or multiple doses of a test substance within 24 hours by a known route (oral, dermal or inhalation). After administration, the test substance is absorbed and distributed to various parts of the body before it elicits systemic adverse effect. The regulatory body requires the acute toxicity test report for labelling and classification of substances for human use.

The LD_{50} (median lethal dose) test was introduced in 1927 by J.W. Trevan to estimate the dose of a test substance that produces 50% death in a given species of animals. It is usually the first test conducted for every chemical before further toxicity tests are carried out. It is used for estimating the potential hazards of chemicals on humans. Although its major endpoint is death, non-lethal acute effect may occur as sign of toxicity depending on the chemical being tested.

Assessment of the acute toxic potential of substances is required to determine their adverse effects that might occur due to accidental or deliberate short-term exposure. Result from acute toxicity test serve as a guide in dosage selection for long term toxicity studies are well as other studies that involve the use of animals.

From the result of an acute toxicity test, a conclusioncan be made on the toxicity status of the substance. As depicted in table 1, substance with LD_{50} below 5 mg/kg are classified to be highly toxic while substance with LD_{50} above 15,000 mg/kg are termed relatively harmless [5-8].

Table 1: Classification of LD_{50} based on dose range.

LD_{50}	Classification
<5 mg/kg	Extremely toxic
5-50 mg/kg	Highly toxic
50-500 mg/kg	Moderately toxic
500-5000 mg/kg	Slightly toxic
5000-50000 mg/kg	Practically non-toxic
>15000 mg/kg	Relatively harmless

OECD Guideline for Acute Oral Toxicity:

OECD Guideline for the testing of chemicals are periodically reviewed in the light of scientific progress or changing assessment practices.The conventional acute oral toxicity test (formerly OECD Test Guideline 401)is the most heavily criticized test in terms of animal welfare and this concern was the driving force behind the development of three alternative tests for acute oral toxicity (Test Guideline 420,423,425).Anticipating the presence of validated alternatives, Member countries took the initiative to plan the deletion of Guideline 401[9-12].

A Nominated Expert Meeting (Rome 1998) and an Expert Consultation Meeting, (Arlington 1999) were convened to determine the acute oral toxicity data requirement needs of Member countries and to assess the capabilities of the alternatives to meet these needs. On the basis of these technical discussions, the 29th Joint Meeting concluded in June 1999 that not all data needs could be met by the alternatives (and not always by Guideline 401). The Joint Meeting decided that Guidelines 420,423 and 425 should be revised to meet regulatory needs of member of countries.

The revision of Guidelines 420, 423, and 425 was completed in 2000 following a second Expert Consultation Meeting (Paris 2000) and process of deletion of guideline 401 was started[13-15].

OECD Guideline 420:
Acute Oral Toxicity-Fixed Dose Procedure:

The method provides information on the hazardous properties and allows the substance to be ranked and classified to the Globally Harmonised System (GHS) for the classification of chemicals which cause acute toxicity.

Principle of the test:

Group of animals of a single are dosed in a stepwise procedure using thefixed doses of 5, 50, 300 and 2000 mg/kg (exceptionally an additional fixed dose of 5000 mg/kg may be considered). The initial dose level is selected on the basis of a sighting study as the dose expected to produce some signs of toxicity without causing severe toxic effects or mortality. Further groups of animals may be dosed at higher or lower fixed doses depending on the presence or absence of signs of toxicity or mortality. This procedure continues until the dose causing evident toxicity or no more than one death is identified or when no effect are seen at the highest dose or when death occur at the lowest dose.

Description of the method:

1. **Selection of animal species:**

The preferredrodent species is the rat. Normally females are used. When the test is conducted in males, adequate justification should be provided. Females should be nulliparous an non pregnant. Each animal, at the commencement of its dosing, should be between 8 and 12 weeks old and its weight should fall in an interval within ± 20 % of the mean weight of any previously dosed animals.

2. **Housing and feeding condition:**

The temperature of the experimental animal room should be 22 c^0. Although the relative humidity should be at least 30% and preferably not exceed 70%.Lighting should be artificial ,the sequence being 12 hours light ,12 hours dark . For feeding, conventional laboratory diets may be used with an unlimited supply of drinking water.

3. **Preparation of animals:**

The animals are randomly selected, marked to permit individual identification and kept in their cages for at least 5 days prior to the start of dosing to allow for acclimatisation to the laboratory conditions.

4. **Preparation of doses:**

Test substances should be administer in a constant volume over the range of doses. In case of liquid end product or mixture is to be tested –use undiluted test

6757 YASHODA TECHNICAL CAMPUS SATARA
DIRECTOR
Yashoda Technical Campus
Satara

substance i.e at a constant concentration .In either case,the maximum dose volume for administration must not exceeded .In rodents , the volume should not normally exceed 1ml /100g of body weight however in case of aqueous solution 2ml/100g body weight can be considered. For vehicles other than water the toxicological characteristics of the vehicle should be known.

Procedure:

1. Administration of doses:

By gavage using a stomach tube or suitable incubation canula(unusual circumstance –fraction of doses).Fasted prior to dosing. Weigh animals and administer the test substance. Withheld food for a further 3-4 hours in rats or 1-2 hours in mice (in case of fraction of doses).

2. Sighting study:

The purpose of the sighting study is to allow selection of the appropriate starting dose for the main study. The substance is administered to single animals in a sequential manner following the flow charts.The starting dose for the sighting study is selected from the fixed dose levels of 5,50,300 and 2000 mg/kg as a dose expected to produce evident toxicity. Also, evidence from in vivo and in vitro data from the same chemical and from structurally related chemicals. In the absence of such information, the starting dose will be 300 mg/ kg. At least 24 hours will be allowed between the dosing of each animal. Consideration of use of an additional upper fixed dose level of 5000 mg/kg. In cases where an animal tested at the lowest fixed dose level (5 mg/kg) in the sighting study dies, the normal procedure is to terminate the study and assign the substance to GHS category. For further confirmation use supplementary procedure.

3. Main study:

Numbers of animals and dose levels

Select dose from sighting study. Perform study on a total of five animals of one sex at each level including animals tested in sighting study. Time interval between dosing at each level depends on onset, duration and severity of toxic signs. Treatment of animals at the next dose should be delayed until one is confident of survival of the previously dosed animals. To check delayed Toxicity-A period of 3 or 4 days between dosing at each dose level is recommended. In case of inconclusive response time interval may be adjusted as appropriate. Fixed dose of 5000 mg/kg procedure outline in Annex 4.

4. Limit test:

Performed when information indicating that the test material is likely to be nontoxic i.e. having toxicity only above regulatory limit doses. How information about the toxicity of the test material can be gained?. Using the normal procedure test will be done [16].

OECD Guideline 423:

Acute Oral Toxicity-Acute Toxic Class Method:

The acute toxic class method is based on biometric evaluation with fixed doses, adequately separated to enable a substance to be ranked for classification purposes and hazard assessment. The method as adopted in 1996 was extensively validated in vivo against LD_{50} data obtain from the literature, both nationally and internationally.

Principle of the test:

It is the principle of the test that, based on a stepwise procedure with the use of a minimum number of animals per step, sufficient information is obtained on the acute toxicity of the test substance to enable its classification. The substance is tested using a stepwise procedure, each step using three animals of a single sex. Absence or presence of compound-related mortality of the animals dosed at one step will determine the next step i.e.

- No further testing is needed,
- Dosing of three additional animals with the same dose.
- Dosing of three additional animals at the next higher or the next lower dose level.

Description of the method:

1. Selection of animal species:

The preferred rodent species is the rat. When the test is conducted in males adequate justification should provided. Healthy young adult animals of commonly used laboratory strains should be employed. Females should be nulliparous and non-pregnant. Each animal, at the commencement of its dosing, should be between 8 and 12 weeks old and its weight should fall in an interval with in ±20%of the mean weight of any previously dosed animals.

2. Housing and feeding conditions:

The temperature in the experimental animal room should be 22^0C. Although the relative humidity should be at least 30% and preferably not exceed 70%. Lighting should be artificial, the sequence being 12 hours light, 12hours dark for feeding conventional laboratory diets may be used with an unlimited supply of drinking water.

3. Preparation of animals:

The animals are randomly selected, marked to permit individual identification, and kept in their cages for at least 5 days prior to dosing to allow for acclimatization to the laboratory conditions.

4. Preparation of doses:

Test substances should be administer in a constant volume over the range of doses. In case of liquid end product or mixture is to be tested-use undiluted test substance i.e. at a constant concentration. In either case,

the maximum dose volume for administration must not exceeded. In rodent, the volume should not normally exceed 1 ml/100 g of body weight however in case of aqueous solution 2 ml/100 g body weight can be considered. For vehicles other than water the toxicological characteristics of the vehicle should be known.

Procedure:

1. Administration of doses:

The test substance is administered in a single dose by gavage using a stomach tube or suitable intubation canula. Single dose is not possible, the dose may be given in smaller fractions over a period not exceeding 24 hours. Animal should be fasted prior to dosing. Following the period of fasting, the animals should be weighed and the test substance administered. After the substance has been administered, food may be withheld for a further 3-4 hours in rats or 1-2 hours in mice.

2. Number of animals and dose levels:

Three animals are used for each step. The dose level to be used as the starting dose is selected from one of four fixed levels 5, 50, 300 and 2000 mg/kg body weight. The starting dose level should be that which is most likely to produce mortality in some of the dosed animals. The flow charts of Annex 2 describe the procedure that should be followed for each of the starting doses.

When available information suggests that mortality is unlikely at the highest starting dose level, then a limit test should be conducted. When there is no information on a substance to be tested, for animal welfare reasons it is recommended to use the starting dose of 300 mg/kg body weight.

The time interval between treatment groups is determined by the onset, duration, and severity of toxic sighs. Treatment of animals at the next dose, should be delayed until one is confident of survival of the previously dosed animals. Exceptionally, and only when justified by specific regulatory needs, the use of additional upper dose level of 5000 mg/kg body weight may be considered.

3. Limit test:

The limit test is primarily used in situations where the experimenter has information indicating that the test material is likely to be nontoxic i.e. having toxicity only above regulatory limit doses. Information about the toxicity of the test material can be gained from knowledge about similar tested compounds or similar tested mixtures or products, taking into consideration the identity and percentage of components known to be of toxicological significance. In those situation where there is little or no information about its toxicity, or in which the test material is expected to be toxic, the main test should be performed.

A limit test at one dose level of 2000 mg/kg body weight may be carried out with six animals. Exceptioally a limit test at one dose level of 5000 mg/kg may be carried out with three animals. If test substance-related mortality is produced, further testing at the next lower level may need to be carried out [17].

OECD Guideline 425:

Acute Oral Toxicity: Up and Down procedure-

This test procedure is of principal value in minimising the number of animals required to estimate the acute oral toxicity of a chemical and in estimating a medium lethal dose. The medium lethal dose allows for comparison with historical data. In addition to the observation of mortality, LD_{50} allows the observation of signs of toxicity. The latter is useful for classification purpose and in the planning of additional toxicity tests.

Principle of the test:

Animals are dosed, one at a time, at 24 hours intervals. The first animal receives a dose at the level of the best estimate of the LD_{50}. Depending on the outcome for the previous animal, the dose for the text animal is adjusted up or down. If an animal survives, the dose for the next animal is increased; if it dies, the dose for the next animal is decreased. After reaching the reversal of the initial outcome i.e. the point where an increasing dose pattern is reversed by giving a smaller dose, four additional animals are dosed following the same UDP. The LD_{50} is calculated using the method of maximum likelihood.

Description of the method:

1. Selection of animal species:

The preferred rodent species is the rat. In the normal procedure female rats are used. When there is adequate information to infer that males are more sensitive, they should replace females in the test. The females should be nulliparous and non-pregnant. At the commencement of the study, the weight variation of the animals should be minimal and not exceed ±20% of the mean weight for each sex. The test animals should be characterised as to species, strain source, sex, weight and age.

2. Housing and feeding conditions:

The temperature in the experimental animal room should be 22^0 C. Although the relative humidity should be at least 30% and preferably not exceed 70%. Lighting should be artificial, the sequence being 12 hours light and 12 hours dark. For feeding conventional laboratory diets may be used with an unlimited supply of drinking water.

Individual animals are dosed in sequence at 24 h intervals, one at time and then observed for a minimum of 24 h. However, the time intervals between dosing should not be fixed rigidly and may be adjusted as appropriate, in case of delayed mortality. The first animal is dosed at the toxicologist's best estimate of the LD_{50}. If the animal survives, the second animal receives a higher dose, unless the limit dose was used as the starting dose. If the first animal dies or appears moribund the second animal receives a lower dose. Moribund state is characterised by symptoms such as shallow, laboured or irregular respiration, muscular weakness or tremors, absence of voluntary response to external stimuli, cyanosis and coma, Criteria for making the decision to humanely kill moribund and severely suffering animals are the subject of a separate Guidance Document. Animals killed for humane reasons are considered in the same way as animals that died on test.

For selecting the starting dose, all available information should be used, including information on structure-activity relationships. When the information suggests that mortality is unlikely then a limit test should be conducted. When there is no information on the substance to be tested, for animal welfare reasons it is recommended to use the starting dose of 200 or 500 mg/kg body weight. The dose for each successive animal is adjusted up or down, depending on the outcome of the previous animal. If feasible, a dose progression factor of 1.3 is used. Other factors may be used, if justified. After reaching the reversal of the initial direction, four additional animals are dosed using the same UDP. This is the end of the normal test.

2. Limit test:
Doses should not exceed 2000 mg/kg which is considered the upper limit dose. When the first animal is dosed with the upper limit dose and survives, the second animal receives the same dose. When total of three animals have been dosed with the limit dose and no deaths have occurred, then three animals of the other sex should be tested at the limit dose level. If there is again no lethality, the test can be terminated.

3. Optional testing:
Information from one sex may be adequate toxicity. However, if found desirable, comparability of response in the other sex can be evaluated by administering to generally not more than 3 animals, dose above and below the estimated LD_{50}. The point intermediate between doses where responses change can be taken as an appropriate estimate of the lethal dose.

4. Administration of doses:
The test substance is administered in a single dose by gavage, using an oral dosing needle or rubberised tubing. The animal should be fasted prior to dosing by withholding food overnight. Fasted body weight of each rat is determined and the dose is calculated according to the body weight. After dosing food may be withheld for a further 3-4 hours. The volume should not exceed 1 ml/100g body weight, except in the case of aqueous solutions where 2ml/100g body may be used[18].

CONCLUSION:

In acute toxicological study, the investigational product is administered at different dose levels, and the effect is observed for 14 days. All mortalities caused by the investigational product during the experimental period are recorded and morphological, biochemical, pathological, and histological changes in the dead animals are investigated. Acute toxicity study is involved in estimation of LD_{50} and also it is useful to determine the absolute dose given to the species in a row was multiplied by the factor given at intersection of the relevant row and column. OECD Guideline 420, OECD Guideline 423 and OECD Guideline 425 these methods are used to determine acute oral toxicity of chemical substance and herbal products.

Abstract
This research work was carrying out to evaluate the natural and micropropagated *Bacopa monnieri* plant extract for skeletal muscle relaxant activity. The skeletal muscle relaxant activity of the extracts was evaluated using Rota rod test. The skeletal muscle relaxant activity of control and treated mice were recorded and statistically correlated among the control, standard and the test drugs. For muscle relaxant property total fall off time for standard and control group was recorded.

Keywords: *Bacopa monnieri*, natural plant, micropropagated plants, skeletal muscle relaxant activity, rotarod test

Introduction

Bacopa monnieri is also known as Brahmi, belongs to family Scrophulariaceae. In the traditional system of medicine the plant is used for number of activities like laxative, carminative, digestive, anti-inflammatory, anti-convulsant, bronchodilator, febrifuge, and nervine tonic [1-6]. The drug mainly contain bacosides which is triterpenoid saponins. Hersaponin, one of its active principle, is reported to have a sedative effect.[7-9] The plant shows cardioprotective and hepatoprotective effects. The plant is an aphrodisiac, effective in treating scabies and syphilis, and purifies the blood, having proven useful for diarrheas and pyresis [10-11].
The plant tissue culture techniques are used for the investigations of the secondary metabolites. Already 2000 plants have been reported to be regenerated through the plant tissue culture. It has also been shown that many of such plants can produce secondary metabolites in culture. Tissue culture (often called micropropagation) is a special type of asexual propagation where a very small part of tissue (shoot apex, leaf section, or even an individual cell) is excised (cut-out) and placed in aseptic culture in a test tube, petri-dish or tissue culture container containing a special culture medium. Tissue culture technology has been known as an effective tool to propagate valuable medicinal plants. Therefore now plant tissue culture has been included as an important tool under biotechnology [12-17].
This research work was carried out to conduct skeletal muscle relaxant of natural and micropropagated plant of *Bacopa monnieri*

Material and Methods

Collection and authentication of plant

Bacopa monnieri was collected from field of Jawaharlal Nehru Ayurvedic Medicinal Plant Garden and Herbarium Kothrud, Pune in the month of February, 1998 and authenticate the plant from same institute. After collection plant material was washed thoroughly with water and kept for drying in the sunlight for 4-5 days. After drying, the plant material was broken into very small pieces and then passed through crusher mill, to obtain coarse powder. The powder was passed though sieve no.12.

Micropropagated tissue culture plant

Shoot tips and nodel segments of B. monnieri L were cultured on Murashige and Skoogs (M. S.) basal medium supplemented with different concentration of BAP and IAA. [12].

Materials

Chemicals and Pharmaceuticals: Chlorpromazine, Tween 80 Instrument and equipment: Rotarod, Animals: Swiss albino mice Others: Syringe, injection needles, weighing balance.

Preparation of drug solution

Ethanolic extract of *B. monnieri* natural (BMN) plant, Ethanolic extract of *B. monnieri* micropropagated (BMM) plant and Ethanolic extract of *B. Monnieri* Standard (BMS) were prepared by dissolving required amount of BMN ethanolic extract in distilled water. A drop of tween 80 was used to prepare uniform suspension. Chlorpromazine (2 mg/kg, ip): It was prepared by dissolving 0.2 mg of chlorpromazine in 1 ml of distilled water.

Pharmacological Screening

Rotarod Test (Muscle relaxant activity)

This test was used in particular to screen myorelaxant activity of the drug. Motor weakness is detected by failure of mice to cling to the rotating rod. In this test only those mice were selected which were capable of remaining on the rotating rod normally for more than 2 minutes. The rod was maintained at the speed of 12 rpm and the mice were kept on the rod facing its back towards the side of observer. Fall time has been used to assess the ability of control and treated mice, individually in each group at the interval of 30 minutes for the period of two and a half-hours. In this experiment, the mice were divided in to 5 groups each groups carrying 6 mice. The first group was served as control and was treated with vehicle

Satara

(tween 80, 0.5% v/v, ip). The second BMN plant ethanolic extract, third BMM plant ethanolic extract and Fourth group BMS ethanolic extract (100 mg/kg ip) of each respectively and last group receiving chlorpromazine (2 mg/kg, ip).[18]

Result

Rotarod Test (Muscle relaxant activity)

Table 1: Effects of ethanol extracts of *B. Monnieri* natural, micropropagated and standard on muscle grip in albino mice by Rotarod test

Treatment (Dose and route)	Rotarod Test (Muscle relaxant activity) in min.					
	30	60	90	120	180	240
Control (tween 80, 0.5%, ip.)	0	0	0	0	0	0
BMN extract (100mg/kg, ip)	0	0	0	0	0	0
BMM extract (100 mg/kg, ip)	0	0	0	0	0	0
BMS extract (100 mg/kg, ip)	0	0	0	0	0	0
Chlorpromazine (2 mg/kg, ip)	3	5	5	4	1	0

Control: tween 80, 0.5% v/v, ip
BMN: *Bacopa Monnieri* Natural plant extract, 100 mg/kg, ip.
BMM: *Bacopa Monnieri* Micropropagated plant extract, 100 mg/kg, ip.
BMS: *Bacopa Monnieri* Standard extract, 100 mg/kg, ip &
CPZ: Chlorpromazine 2 mg/kg ip.

Discussion

The ethanolic extract of BMN, BMM and BMS were evaluated for muscle relaxant activity in mice using rotarod test. The extract failed to show muscle relaxant activity (Table 1).Present pharmacological study with ethanolic extract of BMN, BMM and BMS showed muscle relaxant activity. Such study with natural plan of *B. monnieri* have been confirmed by many worker but the similar study on the micropropagated plants needs to be evaluated**.**

Conclusion

The pharmacological profile indicates that the extract failed to show muscle relaxant activity.

Conflict of interest

The authors declare no conflict of interest.

ABSTRACT:
Tadalafil is a phosphodiesterase 5 inhibitor accustomed to treat dysfunction, benign prostatic hyperplasia, and pulmonary arterial hypertension. Tadalafil is an orally administered drug and it's marketed worldwide under the name Cialis. Analytical method development and validation play important roles within the discovery development and manufacture of pharmaceuticals. These methods is to make sure the identity, purity, potency, and performance of drug product. The bulk of the analytical development effort goes into validating a stability indicating HPLC–method. Analytical method development could be a process of proving that the developed chromatography method is suitable for its intended use within the development and manufacturing of the pharmaceutical drug substance and drug product. All analytical methods that are intended to be used for analyzing any clinical samples will have to be validated. The target of the strategy validation is to demonstrate that the strategy is suitable for its intended purpose because it is stated in ICH guidelines.

KEYWORDS: Tadalafil, Phosphodiesterase 5 Inhibitor, Erectile dysfunction, High performance liquid chromatography, Validation.

INTRODUCTION:

Male erectile dysfunction has been defined as the persistent inability to attain and maintain an erection adequate to permit satisfactory sexual performance. Although erectile dysfunction is regarded as a benign disorder, it has a medical and social impact due to its high prevalence, costs and implications for the quality of life for many men and their partners.

A recent review concludes that the prevalence of erectile dysfunction of all degrees is 52% in men 40 to 70 years old, with the incidence increasing with advancing age. Normal erectile function requires the coordination of psychological, hormonal, neurological, vascular and anatomic factors. Alteration of any of these factors is sufficient to cause erectile dysfunction.[1]

Tadalafil is reversible phosphodiesterase type 5 (PDE5) inhibitor approved for the treatment of erectile dysfunction (ED). As a category PDE5 inhibitors (including sildenafil and vardenafil), enhance erectile response to sexual stimulation by increasing penile blood flow. The duration of action of Tadalafil is longer than sildenafil or vardenafil.[2]

Tadalafil (CIALIS) is an orally administered PDE5 inhibitor has been developed for a treatment for erectile dysfunction. When sexual stimulation causes the local release of nitric oxide gas, which plays a central role within the vasodilation of erectile tissues by stimulating guanylyl cyclase activity, consequently raising intracellular concentrations of cyclic guanosine monophosphate (cGMP) and relaxing vascular smooth muscle. This leads in smooth muscle relaxation and inflow of blood into the penile tissues, thereby producing an erection. Thus tadalafil is indicated for the treatment of male erectile dysfunction. Tadalafil has no effect within the absence of sexual stimuli.[1]

Tadalafil is a phosphodiesterase 5 inhibitor accustomed treats erectile dysfunction, benign prostatic hyperplasia, and pulmonary arterial hypertension. Tadalafil is practically insoluble in water. It does not possess any ionisable groups within the pH range of 1-11 and, subsequently, doesn't demonstrate any changes in solubility in aqueous buffers in this range. It is freely soluble only in solvents like as dimethylsulfoxide and dimethylformamide.[1]

This molecule has 2 chiral centers and thus four different stereoisomers are also found. The molecule obtained in the process described is within the RR form. Crystallization studies show that Tadalafil doesn't exhibit polymorphism.[1]

Chemistry:

1. Synonyms: Adcirca, Cialis, GF196960, HSDB7370, IC351, ICOS351, Tadalafil, Tadalafil Lilly, UNII-742SXX0ICT
2. IUPUC:(6R,12aR)-6-(1,3-benzodioxol-5-yl)-2-methyl-2,3,6,7,12,12a-hexahydropyrazino[1',2':1,6]pyrido[3,4-b]indole-1,4-dione
3. Formula: C22H19N3O4
4. Molar mass: 389.411 g·mol−1 [3]

Figure 1: Chemical Structure of Tadalafil

This study is to develop an easy and accurate RP-HPLC method for the estimation of Tadalafil in tablet dosage form. The method validation is to demonstrate that the strategy is suitable for its intended purpose because it is stated in ICH guidelines. The strategy was validated for linearity, precision, accuracy, specificity, and limit of detection, limit of quantification, robustness and system suitability.[4]

MATERIAL AND METHOD:

Material:

Tadalafil pure drug sample obtain from Tadacip 20 tablet which is manufactured at Cipla Ltd, India. HPLC grade Acetonitrile was procured from E. Merck Ltd, India. SQ grade Potassium Hydrogen Orthophosphate was purchased from Fisher Scientific. AR grade Orthophosphoric Acid was purchased from Rankem. Milli-Q water was used throughout the experiment. Tadacip 20 tablets were purchased from local pharmacy.

Instrumentation:

Analysis was performed on a Summit HPLC chromatographic system, Low Pressure Quaternary Gradient Dionex manufacturer equipped with ASI-100 Automated sample injector, LPG-4 HPLC Pump, programmable variable wavelength PDA-3000 detector. Chromatographic separation was achieved by Agilent eclipse C_{18} column (4.6 x 250mm, 5um). The HPLC system was equipped with "Chromeleon 6.8 SR 11" software to acquire and process the data. Peak purity was checked the PDA detector.[5]

METHODOLOGY:

Standard solutions:

Weigh accurately and transfer about 40mg Tadalafil standard in 200ml volumetric flask. Add about 150ml of Mobile phase. Sonicate for 5 minutes. Allow the solution to attend room temperature and dilute up to mark with mobile phase.

Mobile phase:

Phosphate Buffer pH 4.0: 1.360gm. of Potassium Di-hydrogen Orthophosphate dissolved and diluted in 1000 ml water. Adjust the pH to 4.0 with dilute ortho phosphoric acid. Phosphate buffer pH 4.0: Acetonitrile (50:50). Mix, Sonicate and filter through 0.45 micron nylon filter paper.

Chromatographic Conditions:

An isocratic condition HPLC analysis was performed an Agilent Eclips C18 (150 x 4.6mm, 5um) maintained at conditions (30°C). Chromatographic separation was achieved with mobile phase and mixture of at flow rate of 1.0ml/min and injection volume of 20µl and also the run time is 6 min. the Tadacip 20 was scanned under conditions and from the spectra maxima of 284nm was observed.

DIRECTOR
Yashoda Technical Campus
Satara

Assay of formulation:
Procedure:
Weigh 20 Tablet at a time. Calculate Average weight. Crush Mix to make uniform and perform assay from it.

Sample Preparation:
Weigh and transfer sample powder containing about 40 mg of Tadalafil in 200ml volumetric flask. Add about 150ml of mobile phase. Sonicate for 20 minutes. Allow to attend room temperature. Dilute up to mark with mobile phase. Filter with whatman 41 or equivalent filter paper.

Inject blank, standard and Sample preparation as sequence given below,

(1) Blank (2) Standard preparation (5 replicates) (3) Blank (4) Sample preparation (5) Standard preparation (Bracketing standard)

Perform calculation for system suitability parameters –% RSD of retention time and area of standard replicates, cumulative %RSD of retention time and area of replicate standards with bracketing standard.

System suitability criteria:
1. %RSD for retention time of replicates of standard preparation should not be more than 1.0%
2. %RSD for area of replicates of standard preparation should not be more than 2.0%
3. Theoretical plates for all the standard injections should not be less than 2000. Report Theoretical plate of first replicate of standard preparation.
4. Tailing factor for all the standard injections should not be less than 2.0. Report tailing factor of first replicate of standard preparation.
5. Cumulative %RSD for retention time of replicates of standard preparation with retention time of bracketing standard should not be more than 1.0 %
6. Cumulative %RSD for area of replicates of standard preparation with area of bracketing standard should not be more than 2.0%

If system suitability found within limit, perform calculations for content of Tadalafil Tablet by using formula, Calculate Content of Tadalafil (mg/Tablet) for sample preparations independently by using formula described below.

$$= \frac{\text{(Area of Tadalafil in sample preparation)}}{\text{(Avg. area of Tadalafil Standard preparation)}} \times \frac{W1\ (mg)}{200} \times \frac{200}{W2\ (g)} \times \frac{P1}{100} \times W3\ (gm.)$$

Where,
W1 = Weight of Tadalafil standard taken for preparation of standard preparation (in mg)
W2 = Weight of Tadalafil sample taken for preparation of sample preparation (in g)
W3 = Average weight of Tablet in gm.
W = Weight of sample in gm.
P1 = % Purity of Tadalafil Standard

Acceptance Criteria:
Each film coated tablet content:
Tadalafil per tablet = 18.00mg to 22.00mg

% Assay = 90.00% to 110.00%

Method validation:
A. Specificity and system suitability:
- Experimental design:
1. Inject mobile phase to observe interference at interested peaks.
2. Prepare and inject std preparation individually (as per final conc. Of mixed std preparation).

- **Acceptance criteria:**
1. There should not be interference of any peak at interested peaks.
2. System suitability parameter should meet and assay for tadalafil 20mg should be within limit.

B. Precision
a) Repeatability:
- Experimental design:
  Perform assay in six individual replicates of sample. Perform % RSD of assay.
- Acceptance criteria:
  % RSD for assays should be within less than 2%

b) Intermediate precision:
- Experimental design:
1. Perform assay in six individual replicates of sample by other person on other day with other set of chemicals.
2. Perform %RSD of six sample preparations.
3. Also calculate % variation of average assay values obtained via repeatability and intermediate precision.

- **Acceptance criteria:**
1. Assay for all samples should be within limit.
2. % RSD for assays for intermediate preparation should be less than 2%.
3. % variation of average assay values obtained via repeatability and intermediate precision should be less than 3%.

C. Accuracy:
- **Experimental design:**
1. Prepare samples in triplicate by taking weight equivalent to 80%, 100% and 120% of working levels and perform analysis.
2. Calculate % recovery by factors amount added vs.

YASHODA TECHNICAL CAMPUS SATARA
DIRECTOR
Yashoda Technical Campus
Satara

amount recovered.
3. Calculate %RSD of recovery at each level for triplicate preparations.

- **Acceptance criteria:**
1. % recoveries of individual preparation should be 98 to 102%.
2. % RSD at each level should not be more than 3%

D. Linearity and range:
- Experimental design:
1. Prepare standard preparations at each 80%, 100% and 120% of working level and inject them.
2. Determine co-relation coefficient by plotting linearity graph. Calculate % y intercept

- **Acceptance criteria:**
1. Graph should be linear and co-relation coefficient should be not less than 0.999
2. % y intercept should be within ±2%

E. LOD AND LOQ
- **Experimental design:**
1. 5ppm solution to be prepared and signal to noise ratio is determined.
2. LOD is determined by preparing diluted solutions with signal to noise ratio about 3.
3. Level of concentration at which peak got detected repeatedly but not necessary to be precise is LOD.
4. LOQ is determined by preparing diluted solutions with signal to noise ratio above 3 and about 10.
5. Level of concentration at which peak got detected with precise area (%RSD NMT 2%) is LOQ.

- **Acceptance criteria:**
1. For LOD Single to noise ratio is about 3.
2. For LOQ Single to noise ratio is about 10.
3. For LOQ, %RSD for replicate injections should be less than 2 %

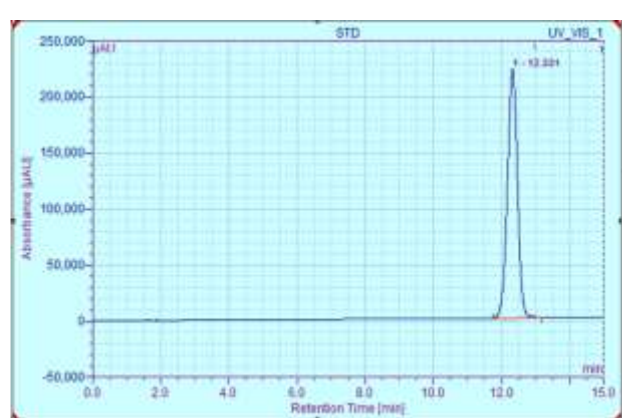
F. Robustness:
- Experimental design:
1. Perform analysis of sample by changing flow rate as 0.8 and 1.2ml per minutes.
2. Perform analysis of sample by changing wavelength 282 nm and 286nm.
3. Calculate % cumulative RSD of assay obtained at repeatability and by changing parameters.
- Acceptance criteria:
1. % cumulative RSD of assay obtained at repeatability and by changing parameters should not be more than 3 %

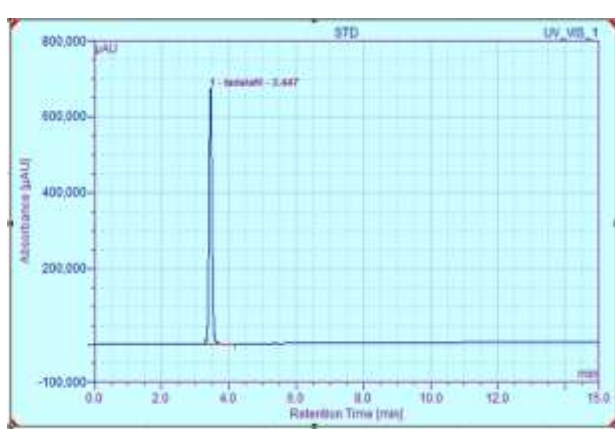
Non-conformance:
Specify the non-conformance (if any) observed during method validation.

RESULT AND DISCUSSION:

Method development and optimization:
In order to optimize the LC conditions for the estimation of Tadalafil in tablet the following trials were performed. Initially a mobile phase consisting of 50mM Potassium Di-hydrogen Orthophosphate (pH 5.0): Acetonitrile (80:20 %v/v) at a flow rate of 1.0mL/min was used on an Agilent Eclipse C18 column (250 x 4.6) column at ambient temperature using mobile phase as diluent, Tadalafil did not elute under these conditions,

In the next trial, same column was employed but the mobile phase was changed to mobile phase consisting of 10 mM Potassium Di-hydrogen Orthophosphate (pH 5.0): Acetonitrile (70:30% v/v) at a flow rate of 1.0 mL/min was used on an Agilent Eclipse C18 column (250 x 4.6) column at ambient temperature.





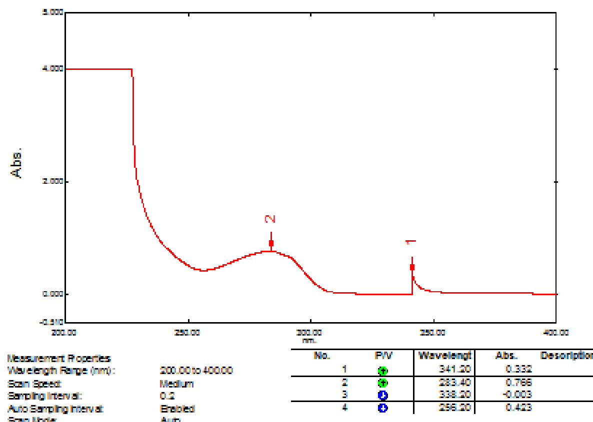
Tadalafil eluate with at 12.331 with theoretical plates 4234 (limit NLT 2000 and Tailing factor 1.58 (NMT2) which well within the limit but as retention time is more and will time consuming during analysis therefore focusing on reduction of retention time drastically. pH of buffer solution reduced with dilute Orthophosphoric acid

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

solution. Organic Solvent content in mobile phase composition increased and also temperature of column increased.

Tadalafil eluate with at 3.447 with theoretical plates 3431 (limit NLT 2000 and Tailing factor 1.55 (NMT 2) which well within the limit. Thus further injection of same std is done and to conclude precision. Corresponding area, RT and system suitability parameters observed.

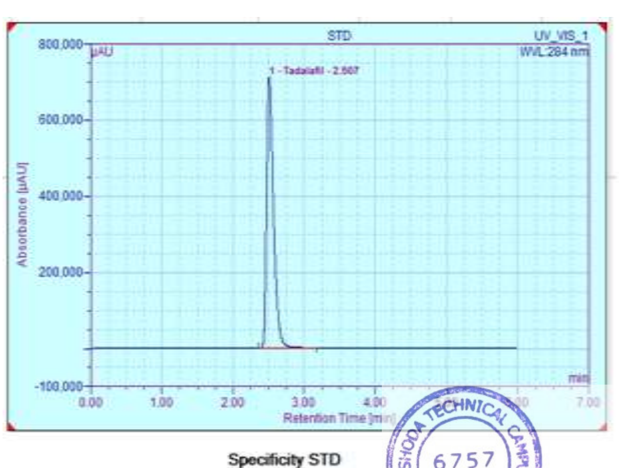
Lambda max is determined before conducting next trial and found 284nm.Next trial conducted with mobile phase consisting of 10mM Potassium Di-hydrogen Orthophosphate (pH 4.0): Acetonitrile (50:50% v/v) at a flow rate of 1.0mL/min was used on an Agilent Eclipse C18 column (250 x 4.6) column at 30°C.



Method validation

A. Specificity And System Suitability:

Specificity demonstrated by observing interference of mobile phase (Diluent). System suitability parameters (% RSD of area, Retention time, Theoretical Plates and Tailing factor) demonstrated by injecting standard preparation in replicate.



Specificity STD

Table no1: Specificity and System Suitability

Std Inj No	Retention Time	Area	Theoretical Plates	Tailing Factor
1	2.507	80482.079	3436	1.59
2	2.507	81838.312	3359	1.59
3	2.508	80682.928	3412	1.58
5	2.507	80378.131	3398	1.57

% RSD	0.04 (Limit NMT 1 %)	0.81 (Limit NMT 2 %)	Limit: NLT 2000	Limit: NMT 2

No interference observed from Mobile phase (Diluent).

Conclusion – Method found specific and capable to achieve System suitability.

B. PRECISION:

A. Repeatability:

The repeatability was demonstrated by preparing the standard solution at 200ppm concentration and six independent consecutive sample preparations at 200 ppm. System suitability found within limit. Relative standard deviation of assay value for six preparations found within 2 %.

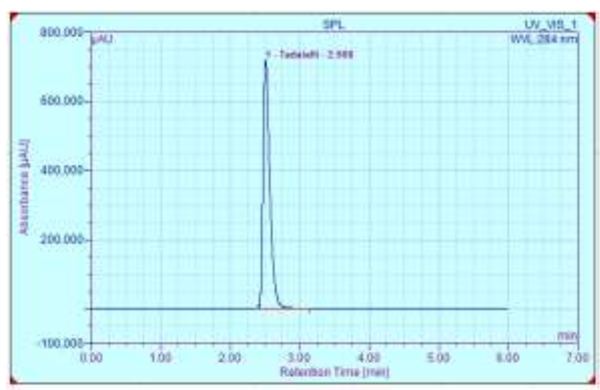

Table no 2: Repeatability Suitability System

Std Inj No	Retention Time	Area	Theoretical Plates	Tailing Factor
1	2.507	80550.869	3436	1.59

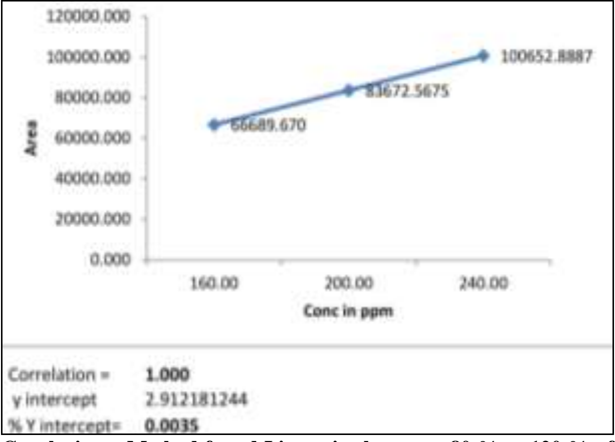
8	240.00	100598.458	
9	240.00	100952.223	



Conclusion – Method found Linear in the range 80 % to 120 % of working level

E. Limit of Detection and Limit of Quantitation (LOD and LOQ):

The limit of detection and limit of quantification means the lowest concentration of analytes in the sample are detected and quantified. LOD and LOQ was found as listed below

Table no 6: LOD and LOQ

Parameter	Obtained value
LOD	0.00035 ppm
LOQ	0.00523 ppm

F. ROBUSTNESS:

Robustness of the method was determined by intentionally changing some operating conditions such as flow rate and wavelength. The flow rate as per the developed method is 1.0ml/min. It has been purposely changed to 0.8ml/min and 1.2ml/min and the chromatogram was developed as well as the wavelength of developed method is 284nm. It has been purposely changed to 282nm and 286nm and the chromatogram was developed.

Conclusion – Method found Robust.

Non-conformance: Specify the non-conformance (if any) observed during method validation.

CONCLUSION:

The proposed RP-HPLC method was simple, sensitive, precise and accurate for determination of Tadalafil n tablet dosage form. The results obtained for all validated parameters were within the limits; hence the proposed method can be easily applied for the quantification of Tadalafil in routine quality control pharmaceutical laboratories. The analytical method used for determination of assay of Tadalafil Tablet is within acceptance criteria for the analytical parameters such as Specificity and system suitability, Linearity and Range, Precision, Accuracy and Robustness. Hence method stands validated.

ABSTRACT

Aim: The purpose of this research is to develop, optimise, and analyse losartan potassium loaded solid SEDDS using a newly synthesised surfactant. Losartan potassium is an angiotensin II receptor blocker that belongs to the BCS class III of antihypertensive drugs. Solid SEDDS were used to increase the permeability, oral bioavailability, and first pass metabolism of losartan potassium, which had a low permeability and oral bioavailability. **Material and methods:** As a surfactant, SDC-PC was synthesized. The solubility of the API in various oils, surfactants, and co-surfactants was investigated, and oleic was chosen as the oil phase, SDC-PC as the surfactant, and PEG 400 as a co-surfactant for formulation. A pseudo-ternary phase diagram was created to get the ideal emulsification area. SEDDS liquid was prepared and tested. Following an evaluation, it was discovered that LP4 was stable and optimum. **Result and discussion:** Aerosil 200 was used as a carrier to convert the formulation into solid SEDDS. The formulations were compared to LOSAR®, as marketed product. On in-vitro drug release, optimised batch LP4 was shown to have similar drug release to the marketed formulation.

KEYWORDS: Losartan potassium, SEDDS, Surfactant, Solid dosage form, Pseudo-ternary phase diagram.

INTRODUCTION

Losartan potassium (LP) is a non-peptide angiotensin II receptor antagonist (Type AT1) that is orally active and undergoes substantial first-pass metabolism by the cytochrome P450 enzyme, with 14 % of the dose converting to an active metabolite.[1,2] LP is a class III drug that comes in the form of a white to off-white free-flowing crystalline powder with a log P value of 5.37, a half-life of about 2 hours, and a systemic bioavailability of about 33%.[1,2,3] The drug is used once or twice a day as a 25 mg tablet, with total daily doses ranging from 25 to 100 mg.[2] In diabetic patients, LP provides beneficial pressure control, lowering the risk of stroke and the progression of renal disease to the terminal stage.[4] LP binds to plasma proteins extensively and can cause gastrointestinal problems, neutropenia, active hepatotoxicity, migraines, and pancreatitis.[5] To reduce the frequency of dose and adverse effects of LP, sustained drug delivery is required to prolong the drug release, and self-emulsifying drug delivery can be employed to achieve this.[3]

Self emulsifying formulations are defined as isotropic mixtures of natural or synthetic oil, liquid or solid surfactant or one or more hydrophilic solvents and co-solvent or surfactants.[6] Upon mild agitation followed by dilution in aq-media, such as GI fluids, these system can form oil-in-water(o/w) emulsion(10-100nm).[7] SEDDS' physical qualities, as well as the chemical structures of its constituents, were found to be important determinants of application and tolerability.[8] These fine microemulsion droplets have the benefit of providing the drug in a dissolved form with a large interfacial surface area for drug absorption, resulting in improved, uniform, and repeatable bioavailability.[9] The oral bioavailability of both hydrophobic and hydrophilic drugs can be improved by increasing membrane fluidity to facilitate transcellular absorption, opening tight junctions to allow paracellular transport, inhibiting cytochrome P450 as isoenzyme in the intestinal region, and inhibiting efflux pumps such as P-glycoprotein.[10] Using a self-emulsifying drug delivery system to improve oral bioavailability of BCS class III medicines has a ton of potential. These systems have been found to be useful in the formulation of first-pass metabolism medications as well as orally delivered pharmaceuticals that obtain access to the systemic circulation through direct absorption into the intestinal lymphatic system.[11]

Following mechanisms are implicated for the improvement of permeability.

- Gastric retention time – The oil in SEDDS can decrease the gastric empting time.

- Lymphatic transport – The oil in SEDDS may enhance the lymphatic transport and the bioavailability of highly lipophilic drugs by promoting their association with chylomicrons in the enterocytes and avoiding hepatic metabolic pathway.
- Intestinal protein efflux – oil and non-ionic surfactants in SEDDS may reversibly inhibit P-glycoprotein and the multidrug resistance related proteins -2 efflux transport or increases the transcellular permeability.
- First pass metabolism – SEDDS may inhibit the action of cytochrome P450 enzyme which metabolizes drug in intestinal wall.[12]

Because liquid SEDDS have disadvantages including instability, low convenience, production processes, interaction during filling in capsule shells, and storage temperature, solid SEDDS were developed. When compared to precursor liquid SEDDS, solidification provides a number of advantages, which can be summarised as better drug solubility and dissolution, improved safety, controlled or sustained drug release, and industrial and commercial benefits.[13]

The aim of our present study to develop, optimize and evaluate losartan potassium loaded solid SEDDS using synthesized surfactant. As surfactant plays important role to reduce surface tension between two different phases. The vesicular based system act as reservoir for the control release of a number of active drug including antibiotics, corticosteroids. They also act as permeation enhancer in systemic absorption.[14]

MATERIALS AND METHODS

Losartan potassium was obtained from YARROW CHEM PRODUCTS, Mumbai. Oleic acid was obtained from S. D. Lab chemical centre, Mumbai. Aerosil 200 was obtained from Gangwal chemical, Mumbai. Stearoyl chloride was obtained from Dolphin pharmacy instrument Pvt. LTD, Mumbai. Sulfanilamide, acetone, n-hexane, ethyl acetate, caster oil, iso propyl myristate, PEG 400, Tween 80. all the chemicals and solvents used in this work belonged to analytical grade.

Synthesis of surfactat

N-((4-sulfamoylphenyl) carbamothioyl) stearamide (SDC-PC) was synthesized by taking stearoyl chloride 0.67 mL (2 mmol) and KSCN 194 mg (2 mmol) in 50 mL round bottom flask equipped with reflux condenser in 20 mL acetone. The resulting mixture was then stirred for 2 hours at 60 °C. After 2 hours, Sulfanilamide 344 mg (2 mmol) was added and

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

refluxed the reaction mixture for further 18 hours (Scheme 1). The progress of the reaction was monitored periodically using TLC in ethyl acetate and n-hexane (3:7, v/v) solvent system.[14]

Evaluation of synthesized surfactant

% Practical yield

Percent practical yield was calculated by following formula:

% practical yield = $\text{Practical yield} \div \text{Therotical yield} \times 100$

Melting point

Melting point apparatus was used to determine the melting point of SDC-PC. In the melting point apparatus, a little amount of SDC-PC was inserted in one end of a closed capillary and the temperature at which the drug melted was recorded and compared to previous research.

ATR-FTIR Spectroscopy

The ATR-FTIR spectrum of surfactant was collected using the ATR-FTIR instrument BRUKER-Alpha 100508. A small amount of drug was collected and applied directly to the ATR diamond. A pressure pump was used to push the medication. The spectrum was obtained by combining 24 scans across a range of 4000-400cm.[15] The precise wavelength of light was partially absorbed by the sample, and at least one was reflected off the internal surface in contact with the sample. The ATR-FTIR spectrum depicts percent transmittance in terms of light wavelength (cm). For all interaction, the spectrum of the sample was acquired and compared to the spectrum of the pure drug.[16]

Critical Micelles Concentration (CMC) Determination

The CMC of all the newly synthesized surfactants were determined spectrophotometrically using UV-visible spectrophotometer (Shimadzu, UV-1800, Japan). Surfactant were dissolved in ethanol in different concentrations i.e. 0.01–0.1 mM read spectrophotometrically. A plot for each concentration versus its absorption was made and then straight lines were drawn on the values. The critical micelle concentration was the point where two straight lines intersect each other on this graph of concentration vs absorption.[14]

Solubility study

Solubility studies in various oils, surfactants, and co-solvents were conducted in order to determine the optimal SEDDS excipients with good solubilizing capacity for losartan

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

potassium.[17] In a glass vail containing an excess of Losartan potassium, one (1) ml of each of the selected oil, surfactant, and co-surfactant sample was added (50-70 mg). To achieve equilibrium, the vails were shaken for 72 hours on an orbital shaker at 40 ° C. After that, aliquots of the supernatants were taken and filtered using a 0.45m membrane filter. Filtration with a 0.45m membrane filter separated the unmixed drug. The filtered sample was centrifuged for 15 minutes at 3000 rpm.

Construction of ternary phase diagram

Phase diagram provide useful platform for delineating the area of microemulsion. Ternary phase diagrams of oil, surfactant/co-surfactant (Smix) and water were developed using the water titration method.[19] Surfactant and co-surfactant were mixed up with six different (Km) weight ratios 1:9 to 9:1. For each phase diagram oil to specific Smix ratio was mixed in different proportion from 0.5:4.5 to 4.5:0.5. Nine different proportions are 0.5:4.5, 4:1, 3.5:1.5, 3:2, 2.5:2.5, 2:3, 1.5:3.5, 4:1 and 4.5:0.5. This made to maximum ratios were covered for the study to delineate the boundaries of phase precisely formed in the phase diagram. A transparent and homogenous mixture of oil/Smix was formed by using magnetic stirring. Then each mixture was titrated with drop wise addition under gentle agitation until the required clarity and flow ability was achieved. The point at which system become turbid, these points were recorded. Corresponding to these points calculate the % w/w combination of oil, surfactant and co-surfactant. Using these points phase diagram was constructed to determine the boundaries of microemulsion reason.[20] The phase diagram constructed using CHEMIX school software version 7.0.

Preparation of liquid SEDDS

By dissolving the amount of Losartan potassium as shown in the ternary phase diagram, a number of SEDDS formulations were created. The oil phase (125 mg) was placed in a vial, and the drug (25 mg of LP) was added straight to this vial and combined using a vortex mixer. To make an isotropic mixture, a sufficient amount of Smix was added to the oil-drug mixture and vortexed, followed by homogenization for 10 minutes. The formulation was checked for turbidity and phase separation before being stored at room temperature until further use.[21]

Evaluation of liquid SEDDS

Thermodynamic stability study

Heating cooling cycle (Freeze-thaw cycle): Six cycles of heating at 45˚C (incubator) and cooling at 4˚C (refrigerator) was conducted for not less than 48hrs at each temperature.

Centrifugation test: Those formulations which passed the heating cooling cycle test then subjected to centrifugation test at 3500 rpm for 30 min. Those formulations that did not show any sign of phase separations, which are most thermodynamically stable.[22]

Dispersibility test

The efficiency of self-micro emulsifying drug delivery system was evaluated by the dispersibility test. Dipersibility study was performed by adding each formulation in 500 ml of distilled water at 37˚C ± 0.5˚C. A standard stainless steel dissolution paddle rotating at 50 rpm provided gentle agitation. The in vitro performance of the formulation was visually evaluated using the following grading system.

- **Grade A:** Rapidly forming emulsion having a clear or bluish appearance (within 1 min)
- **Grade B:** Rapidly forming slightly less clear emulsion, having a bluish white appearance.
- **Grade C:** Fine milky emulsion was formed (Within 2 min).
- **Grade D:** Dull, grayish white emulsion having slightly oily appearance (Longer than 2 min).
- **Grade E:** Formula exhibiting either poor or minimal emulsification with large oil globules present on the surface.[16]

Self emulsification time

A standard USP dissolution apparatus type II was used to test the self-emulsification efficiency of SEDDS. In 900 ml of 0.1N HCI kept at 37 °C, a quantity equivalent to 25mg of each formula's microemulsion was added. A typical stainless steel dissolving paddle moving at 75 rpm provides agitation. The rate of emulsification and final appearance of the microemulsion were visually analysed for the created formulae. These investigations were carried out in order to better replicate the state of the stomach following oral ingestion. With respect to time, the tendency to emulsify spontaneously and the progression of emulsion droplets were observed.[23]

Globules size measurement and PDI

In a beaker, SEDDS formulation (1 ml) was diluted with 100 ml deionized water and constantly stirred with a glass rod. The microemulsion that resulted was then tested for globule size and PDI. Dynamic light scattering with particle size apparatus was used to determine the globule size and PDI of the resulting micrommalsion (Malvern Zetasizer, Ver. 7.12, serial Number: MAL 1098084, UK). The particle (droplet) size was measured at equilibrium. The lowest droplet size values that are more stable, isotropic, and transparent oil/water (o/w) dispersions that have a higher absorption rate potential.[24]

Zeta potential

Zeta potential is the electric potential in the interfacial double layer. Zeta potential is a key indicator of stability. It is indicating the electrostatic repulsion and congregation in oily droplets. The electrostatic repulsion of emulsion droplets plays an important role for assessment of stability of the system High electrostatic repulsion droplets prevent coagulation or flocculation on to fine emulsion droplets into larger oily globules.[25] Zeta potential determined by Zetasizer was monitored at 25°C at a scattering angle 173 (Malvern Zetasizer. Ver. 7.12, serial Number: MAL 1098084. UK)

% Transmittance

The percent clarity of the prepared samples was assessed to demonstrate the formulation's transparency. Using a UV-spectrophotometer and distilled water as a blank, the % transmittance of the system is determined at 650 nm wavelength. If the percent transmittance of a formulation is greater than 99 percent, the formulation is transparent.[21]

Drug content

The drug content was determined by dissolving SEDDS formulation equivalent to 10 mg drug in 50 ml of methanol and mixed well with shaking for two to three times 0.1 ml of this solution was diluted with fresh methanol, and drug content was determined spectrophotometrically (Shimadza 1800, Japan) at 233nm.[26]

Preparation of solid sedds

By using an adsorption approach, liquid SEDDS were turned into free-flowing powders, resulting in a more uniform drug release profile. Drops of liquid SEDDS were added to aerosil 200 in 1:0.25, 1:0.5, 1:1, 1:1.5, and 1:2 ratios, and the mixture was stirred for 5 minutes in a mortar pestle. To ensure a consistent dispersion of the formulation, the mixture

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

was homogenised with a glass rod after each addition. The final mass was passed through mesh no. 120 (0.125mm), dried at room temperature, and stored in desiccators until further examination.[16,27]

Evaluation of solid sedds

Flow properties

Bulk density, tapped density, Hausner's ratio, Carr's index, angle of repose was evaluated.

Reconstitution properties of solid SEDDS

Effect of dilution on solid SEDDS

The property of quick emulsification was noticed after 100 mg S-SEDDS was correctly weighed and added to 100 ml distilled water in a beaker at 37°C and gently stirred with a magnetic stirrer at 100 rpm. The tendency to produce an emulsion was determined as follows:

- Good - If emulsification occurs in <1 min with clear or transparent emulsion.
- Bad – If emulsion if less clear or transparent[16]

In vitro dissolution test

The drug dissolution profile was studied using the USP dissolution apparatus II (Electrolab, Mumbai). Dissolution tests were performed in 900 ml of 0.01 N HCI (pH 2.0) at 37 0.5 °C with 75 rpm stirring. 10 mg of LP and formulation batches were introduced to the dissolution medium, and 5 ml samples were withdrawn after 10, 20, 30, 40, 50, and 60 minutes, and replaced with 5 ml fresh 0.5 percent Polysorbate 20 in 0.01 N HCL each time. The solutions were immediately filtered through a 0.45 um membrane filter, diluted, and UV-spectrophotometrically measured at 233nm.[28]

Drug and excipient interaction

ATR-FTIR spectra of pure LP, Aerosil 200, physical mixtires and Solid SEDDS formulations were recorded by ATR-FTIR Spectrometer (ALPHA 100508 BRUKER. US) to illustrate the promising interactions among the excipients used in the formulation. The spectrum was scanned over the wave number range of 4000-400 cm^{-1}[16]

RESULT AND DISCUSSION

% Practical yield

% Practical yield of synthesized surfactant was found to be 84.32%.

Melting point

Melting point of synthesized surfactant was found to be 135˚C

Fourier transforms infrared (FTIR) spectroscopy

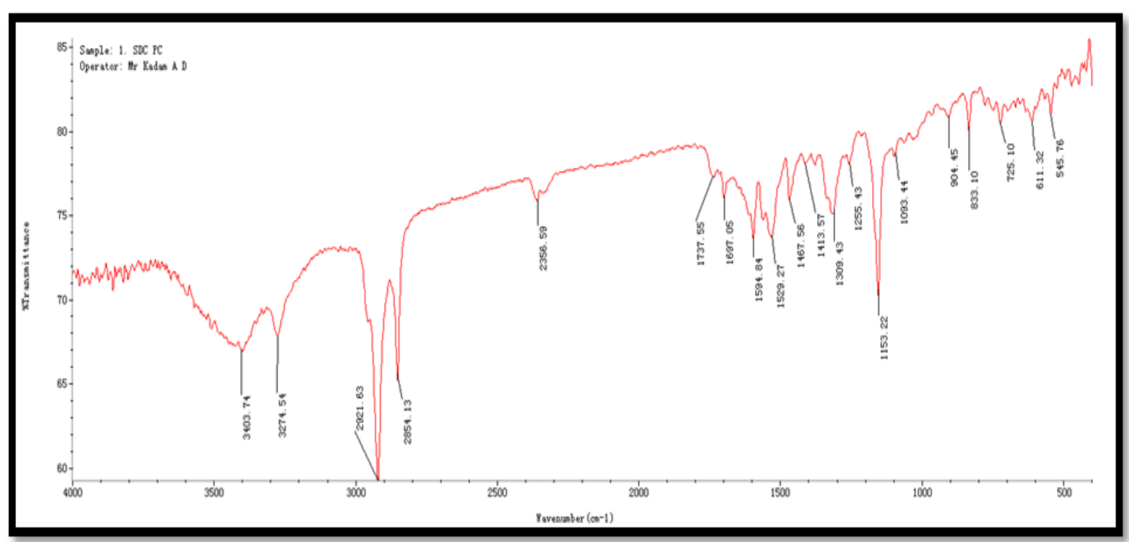

Fig. 1: ATR-FTIR spectrum of SDC-PC.

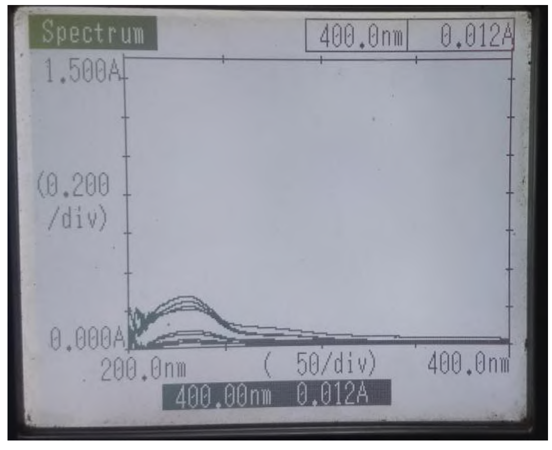
ATR-FRIR spectrum of SDC-PC is given in above figure. The spectrum shows NH_2 asymmetric at 3403.74 cm^{-1}, NH at 3274.54 cm^{-1}, CH_2 asymmetric at 2921.63 cm^{-1}, CH_2 symmetric at 2854.13 cm^{-1}, C=C aromatic at 1529.27 cm^{-1}, C-N at 1309.43 cm^{-1}, C-S at 1153.22 cm^{-1}. All characteristic peak of surfactant found in reported range.

Critical micelles concentration

The critical micelles concentration is an important phenomenon for scientist and researchers in the field of drug delivery. The micellization is the property of non ionic surfactant and polymers. No-ionic surfactant when exposed to the water forms aggregations called as micelles. When surfactants are added to a solvent, they are dispersed in the solution. By increasing the concentration of surfactant i the medium, at CMC they form micelles. CMC can be found by plotting graph of suitable physical property as a function of surfactant concentration. The CMC values of synthesized surfactant were determined by plotting the absorbance at λ_{max} against the concentration of each surfactant. The surfactant SDC-PC was read ranging from 0.01-0.1 µg/ml concentration and its CMC was calculated as 0.06mM.



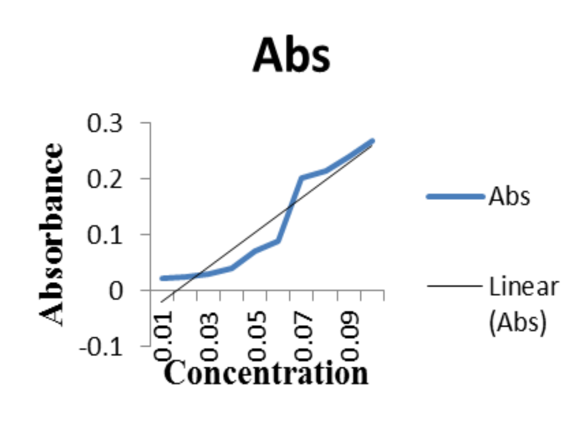


Fig 2: UV-visible spectra and CMC of SDC-PC.

Solubility study

After performing solubility study, the drug was found to be more soluble in oleic acid (oil), SDC-PC (surfactant), PEG400 (co-surfactant) results are shown in fig.

Construction of ternary phase diagram

The pseudo-ternary phase diagram is useful to determine the suitable combination of oil, surfactant and co-surfactant concentration in the formulation to form the nano-emulsion. After selection of oil, surfactant and co-surfactant based on the solubility study, the pseudo-ternary phase diagrams containing a fixed ratio of surfactant and co-surfactant (Smix) were constructed. The ternary phase diagram of the system containing SDC-PC: PEG 400 with the ratio of 1:9 formed with the wider emulsifying region in the presence of oleic acid as oil. It is clear from Fig.7 that the emulsifying region increases with an increase in the amount of surfactant mixture concentration in the system. Several reports explained this phenomenon of a decrease in the mean droplet size as an outcome of an increase in the concentration of surfactant and vice versa. The reduced droplet size with a high concentration of surfactant mechanism may be supported with the following statements:

- Stabilization of the oil droplet occurs with reduction in the interfacial tension between oil and water phase at a high concentration of surfactant.
- Enhancement of water penetration into oil in the presence of high surfactant which causes the release of oil droplets in aqueous phase

The addition of the drug did not affect the self-emulsifying region significantly.

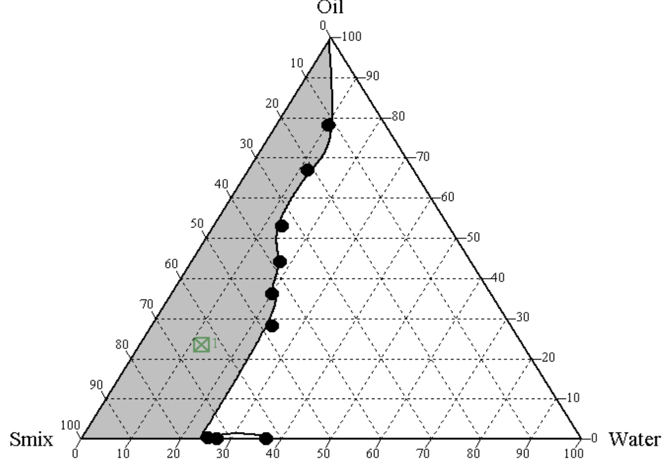

Fig. 7: Ternary phase diagram (Smix 1:9).

Preparation of liquid SEDDS

A total of four (4) formulations LP1 to LP4 were successfully prepared with their respective composition as shown in table 1.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Table 1: Formulation table of Liquid SEDDS.

Batch code	Drug (mg)	Oil (%)	$Smix_1$ (%)	$Smix_2$ (%)	Weight of batch (%)
LP1	25	70	-	30	100
LP2	25	60	-	40	100
LP3	25	50	-	50	100
LP4	25	40	-	60	100

Thermodynamic stability study

The thermodynamic studies have always helped determine the kinetic stability of the formulation. The main criteria of microemulsion for pass this test is not to show any indication of phase separation, creaming, cracking or coalescence. All the prepared formulations had passed the thermodynamic study test, with no signs of phase separation and precipitation of drugs. This indicates that the prepared formulations were stable against the maintained storage conditions.

Dispersibility test

The dispersibility of microemulsion shows Grade A of all formulations showed a rapidly forming emulsion having a clear or bluish appearance (within 1 min).

Table 2: Dispersibility grades and self emulsification time.

Sr. No.	Batch	Dispersibility Grade	Self emulsification time (sec)
1	LP1	A	54
2	LP2	A	48
3	LP3	A	45
4	LP4	A	44

Self emusification time study

The emulsification time of all batches was found to be in the range of 44 to 54 seconds as shown in Table 2. The batch LP4 showed very short emulsification time. The determination of self emification time for the assesment of microemulsion spread or scatters in GIT medium. Smaller the size of particle faster the lease and shows the efficiency of formulation.

Globule size, PDI and Zeta potential

Globule size of emulsion plays important role in absorption and also in stability. Globule size of optimized formulation was observed 836.7 nm (Fig.8) which is within the range of nano-emulsion (500-1000nm) and polydispersity index (PDI) was observed 0.466. Zeta potential of

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

optimized batch was observed -0.329 mV (Fig.9) negative potential around particles shows improved lymphatic uptake of system.

Table No.: Globule size, PDI and zeta potential of all batches.

Batch	Globule size	PDI	Zeta potential

for drug release. Percent transmittance of formulation was found to be in the range of 100% to 93.2 % and tabulated in Table 3.

Table 3: % transmittance measurement.

Sr. No.	Batch	% Transmittance
1	LP1	96.1
2	LP2	98.3
3	LP3	99.0
4	LP4	100.3

Drug content

The drug content of the prepared losartan potassium loaded SEDDS was determined to evaluate the uniformity of dose in the formulation. The drug content in different prepared batches is listed in table 29. Drug content of liquid SEDDS formulation batch LP4 was found to be highest as 98.81%. So it was considered as obtimized batch for further evaluation.

Table 4: Drug content of liquid SEDDS formulation.

Sr. No.	Batch	Drug content (%)
1	LP1	98.32
2	LP2	97.56
3	LP3	98.79
4	LP4	98.81

Formulation of solid SEDDS

From the evaluation of liquid SEDDS it was observed that LP4 was optimized batch so LP1, LP2, LP3, LPV4 batches are converted to solid SEDDS to avoid stability problems. Solid SEDDS formulations were prepared by using the carrier i.e. Aerosil 200. Optimized liquid SEDDS converted into solid SEDDS by using adsorption technique. The solid carrier demonstrated to be effective to construct free flowing powder form of liquid SEDDS with high surface area. The amount of carrier required to absorb the liquid SEDDS was strongly associated with the surface area of adsorbant.

Table 6: Formulation batches of solid SEDDS.

Batch code	Liquid SEDDS (mg)	Aerosil 200 (mg)	Total wt. of tablet (mg)
LP1	350	250	600
LP2	350	250	600
LP3	350	250	600
LP4	350	250	600

Evaluation of Solid self emulsifying drug delivery

Flow properties

Flow properties of solid SEDDS such as angle of repose, bulk density, tapped density, carr's index and hausner's ratio are deteremined and found that the prepared solid SEDDS showed "Good" flow properties as showed in Table 7.

Table 7: Flow properties of Solid SEDDS.

Batch	Bulk density (gm/ml)	Tapped density (gm/ml)	Hausner's ratio	Carr's index	Angle of repose
LP1	0.77	0.75	1.1	9.09	27.75
LP2	0.81	0.76	1.06	15.71	29.05
LP3	0.76	0.65	1.26	7.89	27.14
LP4	0.81	0.70	1.09	13.58	26.56

Effect of dilution on solid SEDDS

The formulation LP4 has found to have "Good" dilution than that of other formulations.

In-vitro dissolution test

In-vitro drug released was performed between marketed formulation and optimized batches. The in-vitro dissolution of prepared solid SEDDS was compared with marketed formulation (LOSAR®). From the result it was observed that LP4 shows more release compared to the marketed formulation these findings conclude an enhancement of permeability and, as a result the improved bioavailability of Losartan potassium.

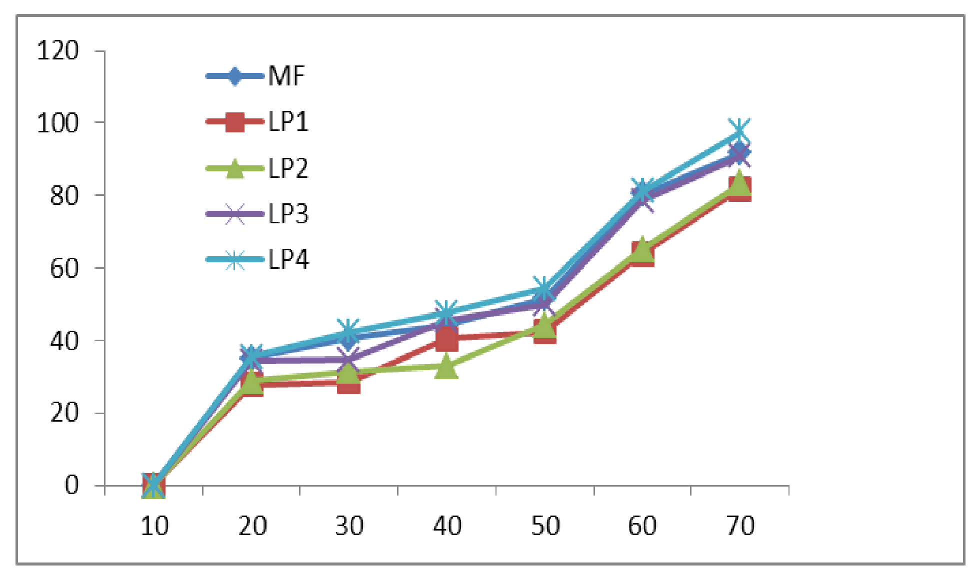

Fig. 11: In-vitro drug release.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Drug excipient interaction by ATR-FTIR

From the observation of all FTIR spectra, it was evident that all important peak of losartan potassium and the excipients used were located in the solid SEDDS. Hence it could be concluded that there was not any chemical interaction between the drug and excipients.

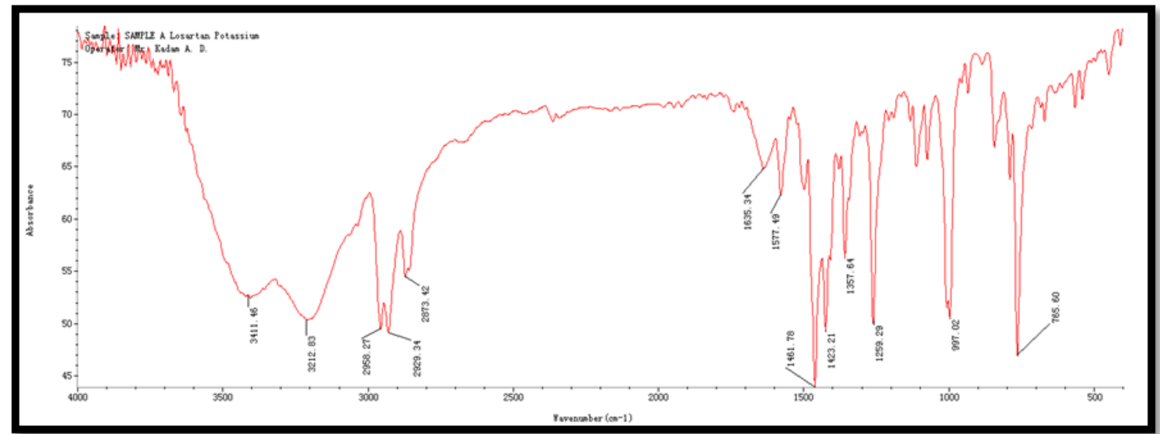

Fig. 12: Infrared spectrum of Losartan potassium.

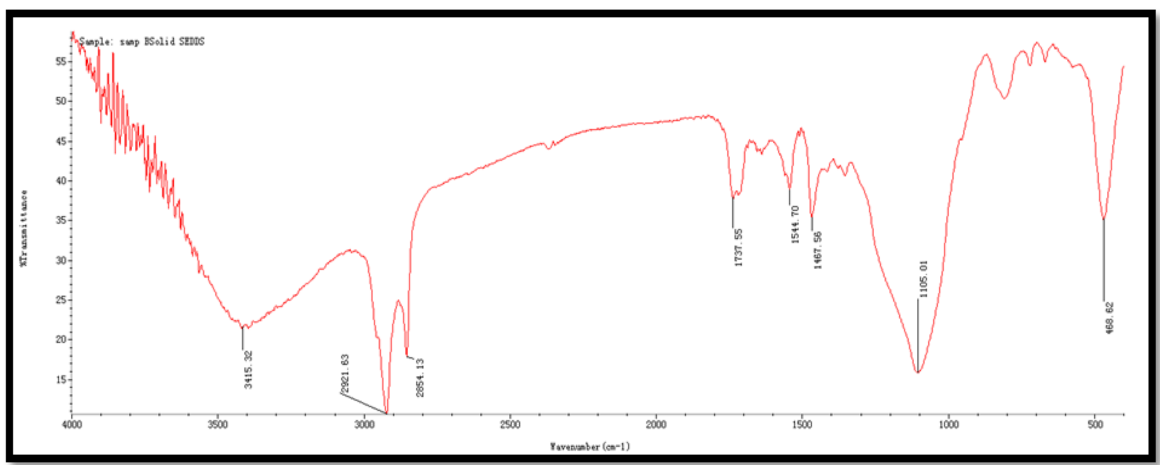

Fig 13: Infrared spectrum of solid self emulsified drug delivery system.

CONCLUSION

Liquid SEDDS of losartan potassium with oleic acid as oil phase, SDC-PC as surfactant and PEG400 as co-surfactant was successfully developed. Based on thermodynamic stability study, self emulsification time, % transmittance, zeta potential, particle size study LP4 formulation was selected. Based on above studies it was concluded that SDC-PC can be used as surfactant in SEDDS which shows good results. So LP4 formulation further converted to solid SEDDS using Aerosil 200 as a carrier and evaluated for the flow properties, effect of dilution, in-vitro drug release and FTIR studies. % drug release of solid SEDDS was almost similar to marketed formulation LOSAR®.

Chatbot for Children Assistance

Ankita Dadaso Raskar[1], Akshata Santosh Dongare[2], Afrin Salim Inamdar[3], Rutuja Bharat Kamble[4], Pranali Laxman Patil[5], Dr. S V Balshetwar[6]

Abstract: Children of age 3 to 7 are unaware of language and they face trouble while learning new things so this chatbot application is designed for them to make their start towards learning easy and in interactive way. This application will help them to learn basic things required in daily life and also will entertain them. This application is helpful to enhance their skills. This is designed to provide an interactive learning medium which results in fast progress of child.

A chatbot is artificial intelligence (AI) software that can simulate a conversation (or a chat) with a user in natural language through messaging applications, websites, mobile apps or through the telephone. A chatbot is often described as one of the most advanced and promising expressions of interaction between humans and machines. Machine Learning and artificial intelligence are fast growing technologies and are used in any area to make human activities easy and fast. Chatbots are way more than simple conversational agents. They can be connected to various APIs which will for example enable them to deal with a wider range of children requests.

Multifunctional chatbot assistance built using this technology will help children in day to day activity. During 19 pandemic some issues are raised as big concern one of them is children health and growth. Parents are unable to give their proper attention to their child due to work pressure, work from home.

Chatbot assistance will help them out in daily activities and give guidelines which will beneficial to their health and growth. Chatbot will work as a their study partner.

I. INTRODUCTION

During Covid 19 Pandemic for online study of primary school students Government of Maharashtra developed a whatsapp chat assistance called "Convegenius". It was beneficial for student during weekly test as it was interactive. Students got familiar with it easily. There is no any other such application available for students below age of seven which help them in study and their daily activity. So we propose making of a voice chatbot for children of age group 3 to 7 to assist them in their activity and bind them to study with entertainment. And the main motivation we found that the majority of a chatbot users it gives a motivation for using a chatbot. It was very effective and efficient to use. Machine Learning and artificial intelligence are fast growing technologies and are used in any area to make human activities easy and fast. Multifunctional chatbot assistance built using this technology will help children in day to day activity.

Children assistant is very useful for children and it is very innovative for them. It facilitates help to do daily work of children and their studies also. This is help children to solve their different questions and also solve health issues between them .It is also helpful for their parents to overcome the care for their children. At present , children are also familier with the every technology so,our project is very helpful for them to make their intertainment medium helpful

II. LITERATURE REVIEW

Today virtual assistance are boosting technology and are used in various field. They are easy to install and access so used widely due to their flexibility. While studying Chatbot system we found that it would be beneficial for children as they love interactive sessions. So we studied different research paper on various chatbot applications to understand basic concepts and terms related to chatbot.

As per [1] Author has developed smart college chatbot using machine learning and python as a channel for information distribution. This project will investigate how advancements in Artificial Intelligence and Machine Learning technology are being used to improve many services. For human language processing they used Natural Language Processing (NLP) ("NLP: ability of computer to understand, analyze, manipulate, and potentially generate human language."). For some features they have also focused on Artificial Intelligence Markup Language (AIML) ("AIML: AIML is an XML dialect for creating natural language software agents").

As per [2] author has focused on design and development of an intelligent voice recognition chatbot. The paper presents a technology demonstrator to verify a proposed framework required to support web based bots. This online chat system follows client server approach. Voice recognition process has two parts capturing and analysis of input signal which allows the server to generate response faster.

6757 SATARA DIRECTOR Yashoda Technical Campus Satara

When comes to health generating response is more crucial and needs the high accuracy in [3] we studied the chatbot system for conversational healthcare service. In project the way they have distributed tasks and deep analyzing of data was quite impressive. They have made the module to understand user which is beneficial in response generation.

As per [4] author has focused on dialog management approaches and tools with respect to the different aspects like capability of creating natural, robust and complex dialogs, convenience for developers, scalability, reusability. On analysing these goals they had proposed the dimensions of analysis such as dialog structure, learning, error handling, dependencies, control, domain independence, and tool availability.

As per [5] author has outlined interpersonal assistants as a promising model that conversational agents may evolve. They also mentioned some elicited key functional elements for always-on services running on resource-scare devices. This helped to understand how to keep our assistant always active in proper manner.

As per [6] - this paper illustrate a web based infrastructure of architecture for conversational agents equipped with a modular knowledge base. It focuses on the enhancement of the agent interaction capabilities. From paper we study about web based chatbot and their infrastructure.

As per [7] author G. Pilato, A. Augello and S. Gaglio, in paper "A Modular Architecture for Adaptive ChatBots," has illustrated architecture for a conversational agent based on a modular knowledge representation. This paper focus on accurate response for query in effective manner to make conversation more attractive.

As per [8] automatic chatbot knowledge acquisition method from online forums is presented in this paper. It includes a classification model based on rough set and the theory of ensemble learning is combined to make decision.

As per [9] this paper presents a survey on similarities, differences, and limitations of the existing chatbots, it also presents a survey on existing chatbots and techniques applied on it. This gives the clear idea of continuous evolution of chatbot assistant. This paper helps us to understand current limitations of chatbot system. Also we got the knowledge various technology used in different types of chatbots.

This paper [10] "Review on Implementation Techniques of Chatbot," provides a critical review of chatbots and the current strategies are executively explored and talked discussed. This paper is also based on comparison of different chatbots implementation techniques. From paper we get idea for better implementation of chatbot.

Table 1. Comparison Table

Sr. No.	Paper Name	Publisher	Techniques	Merits	Demerits
1	Smart Collage Chatbot using ML and Python	H.K.K, A .K. Palakurthi , V .Putnala , Dr. Ashok Kumar K	Here artificial intelligence, machine learning, natural language processing techniques are used	1. This paper provide more user interactive as it responds to the user queries. 2. As the paper the feedback is stored in the database which can used by collage to know how efficiently chatbot is answering user queries.	This paper only show that user can ask any numbers of queries to chatbot system regarding collage.
2	An intelligent Web-Based voice chatbot	S.J.du Preez,Student Member,IEEE,M.Lall2.S.Sinha3,MIEEE ,MSAIEE	Here Artificial Intelligence,XML ,JAVA,AIML,ALICE techniques are used	This paper shows environmental facilitating transparent and high performance of the overall system	This paper shows that all modules can not running off one system.
3.	Chatbot as Conversational Healthcare Services	Mladan Jovanovic, Marcos Baez, Fabio Casati	Here shared design metaphor technique used	The paper shows that how chatbot easily interact with human/patient.	The paper only provide medication reminder not a medicines to a patients.

4	Approaches for Dialog Management in Conversational Agents	J. Harms, P. Kucherbaev, A. Bozzon and G. Houben,	Hera automatic speech recognition, artificial intelligence, machine learning are techniques used	1. This paper provides an overview of the state-of-the-art of commercial as well as research tools. 2. This paper shows opportunities for future research directions.	This paper shows memory network research is not mature enough yet to explore domain independence.
5	Towards Interpersonal Assistant: Next Generation Conversational agent	Inseok Hwang, Chulhong Min Youngki Lee , Dangsun Yim, Chungkuk yoo John Kim.	Here shared design metaphor techniques used and Artificial Intelligence are use	1. It trains the parents and develops the language of child. 2. Frequently changing speech characteristics as they grow, and insufficient speech carpus specialized in children.	1. This paper provides prominence of micro structural properties is not limited to a particular example of interpersonal assistants.
6	A Modular Framework for Versatile Conversational Agent Building	A. Augello, M. Scriminaci, S. Gaglio and G. Pilato	Here conversational agents, modular KB, ontology reasoning, semantic spaces techniques are used	This paper provides the information about architecture and how to exploit different modules suited for specific dialogue requirements.	The test script have test data embedded in them, which will become problem when updating the code
7	A Modular Architecture for Adaptive Chatbots	G. Pilato, A. Augello and S. Gaglio	Here artificial intelligence, Corpus Callosum techniques are used	This paper provides intelligent conversational agents with a dynamic and Hexible behaviour.	Speech acts are detected through a simple rule-based speech act classifier whose description goes beyond the scope of this paper.
8	Automatic Chatbot Knowledge Acquisition from Online Forum via Rough Set and Ensemble Learning	Y. Wu, G. Wang, W. Li and Z. Li	Here Forum, Multiple rough set techniques are used	This paper shows high recognition efficiency to related replies and the combination of ensemble learning improve the result.	Approaches are not capable of extracting knowledge for specific domain.
9	A Survey on Chatbot Implementation in Customer Service Industry through Deep Neural Networks	M. Nuruzzaman and O. K. Hussain	Here Neural Network, Peep learning, Natural language processing, Dialogue system techniques are used	This paper provides sequential attention mechanism in deep recurrent neural networks.	Existing chatbot do not have an interactive user interface and maintain poor documentation.
10	Review on Implementation Techniques of Chatbot	S. Nithuna and C. A. Laseena	Hare AIML, ALICE,DNN, machine learning, natural language processing techniques are used	In this paper critical review of chatbot and current strategies are explored.	Hard to understand the framework effectively with no rules to visitors.

DIRECTOR
Yashoda Technical Campus
Satara

III. CONCLUSION

Chatbot assistant or virtual assistant are fast growing technologies having large impact on different industries. We have variety of virtual assistant available in market which helps to reduce the human efforts as they are self-learners from conversation and automated. There is no need to invest our time in their tasks as once it started learning it start becoming better and better.

While building a chatbot first we have to create proper sequence of conversation as it is the heart of system. With proper flow of dialog system becomes more attractive. Choosing correct technology is crucial part of building a chatbot. We have make our system with respect to current technology used in industry and update its functionality to make it compatible with respect to time. Also the starting and ending of conversation is important to make impression on user. We have to focus on requirement of end user and try to fulfill them. Adding feelings and improve relevant answers is must to make chatbot appear as real person.

Smartphone User Behaviour Predication Using AI

Mayur Ramesh Chavan[1], Akshay Avadhut Kulkarni[2], Mohammad Kaif Shakil Mulla[3], Ashish Hanmant Mahadik[4], Omkar Jagnnath Waghmare[5], Dr. S V Balshetwar[6]
[1, 2]Dr. Daulatrao Aher College of Engineering Karad

Abstract: There are lots of Smartphone users data floating around which is not efficiently used for improving user experience and which can be used to provide a better user experience or enhance the current one. Enhancing user experience is a challenge as there are multiple competitors. A persons time spend on their Smartphone is an vast amount of time and everyone is trying to reduce this time by implementing efficient ways of android user experience. Starting with our work, which will focus on this user floating data? There are important segments of this user data one of them is facial data because humans are used to taking in non verbal cues from facial emotions. And also we are focusing on factors like user surrounding sound, user's locations and patterns of application used history.

I. INTRODUCTION

As in the 21st century Electronics devices are conquering the whole world and use of Smartphone is increasing day by day in which most of the time spent on smart phone is less productive, whereas it leads to wastage of time. So while studying an average Smartphone user we found that the Smartphone can cause two different problem, where first one shows a negative and second one shows positive impact of Smartphone . Coming to the first problem shows us the deficiency.

So now we will discuss the first problem and further continue to explain second problem. There are lots of Smartphone user's data floating around which is not efficiently use for improving user experience and which can be used to provide a better user experience or enhance the current one. Enhancing user experience is a challenge as there are multiple competitors. A persons time spend on their Smartphone is an vast amount of time and everyone is trying to reduce this time by implementing efficient ways of android user experience. Overusing pattern of Smartphone involves a tendency to check notifications all the time. Such behavior pattern can induce "reassurance seeking" pathway which broadly includes symptoms such as loneliness, low self-esteem, depression, and anxiety. Excessive use of Smartphone may also affect sleep patterns by reducing rapid eye movement sleep, slow-wave sleep and consequently causing sleep.

II. LITERATURE REVIEW

Coming to the first problem discussed above that is the overusing pattern of Smartphone involves a tendency to check notifications all the time. Such behaviour pattern can induce many health problems. After studying these problems we found that there can be a single solution, which will be focusing on prediction of an average Smartphone user behaviour. As this can be a challenging task because there are varieties of peoples from different age group, different background, etc.

So we decided to focus on a specific group of people which are "Students". As student are the most suffering from Smartphone addiction as they are in there early years of education life. Student may feel overwhelmed, curious, lonely, bored, stressed, depressed or even anxious about something. Once they enter in virtual world of Smartphone applications, they might feel to forget worries and feel better. But this can further lead to addiction, as student can make Smartphone as comfort zone and spend more and more time on Smartphone. Smartphone is a device that brings the world closer to us but excessive use of it can disturb real world connections.

As we have studied problems related to Smartphone user behaviour found some solutions and these solutions are highlighted are in our research. In [1] Ankita Kanhangadand and et.al.in there paper had taken the data from the sensor like orientation sensor, accelerometer sensor and gyroscope sensor which are built-in sensors. And from these dataset taken from the various sensors they are going to only predict the human behaviour. The analysis of human behaviour has been proven to be effective in various applications including biometricbased user authentication, smart spaces, human-machine interactions, physical activity recognition and surveillance. The advantage of this thing is human behaviour is captured unobtrusively without requiring a conscious effort on the part of user. This study will help us to explore techniques that can be used to predict human behaviour.

As per [2] Subrata Tikadar and Samit Bhattacharya are it is very important to know user behaviour to design and built effective interaction system, tools or application.

DIRECTOR
Yashoda Technical Campus
Satara

The behavioural study not only helps to assure the success of any design or product but also helps other researchers from various related areas. They have systematically collected and analyzed the behavioural data for Smartphone usage by 1711 students of 188 academic institutions throughout India.

They have also observed students behaviour on Smartphone usages both inside and outside the classroom. They have also found dissimilarities and are also expecting that the findings of the study will help many researchers from various fields including HCI, Mobile HCI, Behavioural Science, Psychology, and Education. This study will help us to know importance of prediction of human behaviour and explore its depth knowledge.

As per [3] authors have here presented the article, which present the frameworks for mobile audience measurements, for collecting data at the point of convergence - devices.

This paper compares the presented framework to alternative methods of mobile user research, and identifies the unique advantages of on-device measurements along with the key weaknesses. This study shows us that there are various techniques of mobile audience measurement from various aspects through a Smartphone.

In[4] Ruxia hong has focused on the research of mobile user behaviour based on big data and it has become one of the hotspot in the field of internet, Every internet user leave their footprints.

It is based on the analysis of the characteristics of mobile user's big data and hadoop system, an analysis model of mobile user's behaviour pattern based on big data is constructed, it includes data acquisition module, data pre-processing module, user behaviour analysis module, application of mobile user behaviour model and data visualization module, and the function of each module is explained in detail. This study shows us that big data can play a measure role to analyse data sets and also that internet can be a vast plays to explore Smartphone user data.

As per [5] author has given the model of machine learning for activity recognition and authentication of Smartphone user.

As per Authors technological advancements have made Smartphone's to provide wide range of applications that enable users to perform many of their tasks easily and conveniently, anytime and anywhere. As per their study many users are tend to store their private data in their smart phones.

Since conventional methods for security of Smartphone's, such as passwords, personal identification numbers, and pattern locks are prone to many attacks, this research paper proposes a novel method for authenticating Smartphone users based on performing seven different daily physical activity as behavioural biometrics, using Smartphone embedded sensor data. This authentication scheme builds a machine learning model which recognizes users by performing those daily activities. This study shows us that Smartphone sensors can be combined and used for user identification to increase security measures.

As per [6] Balaji Balasubramanian and Pranshu Diwan et. al. signify in their paper that human beings relay a lot on non-verbal communication and facial emotion in large. In this Paper they cover the dataset and algorithm that are used for Facial Emotion Recognation(FER). And the algorithms range from simple Support Vector Machines (SVM) to complex Convolutional Neural Network (CNN). This paper shows us importance of facial emotion and how it can play a measure role in our work since they have also represented various techniques for recognising it.

As per [7] Richard Han, Mahnaz Roshanaei and Shivakant Mishra all authors present in this paper have formed a group of 20 peoples for a research that put in the picture how every individual from the group reacts in different scenario that relates with respect to their Smartphone. They experimented most of the possible scenarios and prepared data sets to be tested with machine learning algorithms for the better accuracy to knowing their behaviour.

As per [8] Natasha Jaques, Sara Taylor, Asaph Azaria and et.al. focused in this paper that an average teenagers happiness depends on some of their close things that also includes there Smartphone's and other things like sleep. These things can affect measure things in their life and can also result in their personal losses and they also found 70% accurate module that shows this behaviour. This study can help us with our research to know about this factors and there consequences.

As per [9] mobile phones are equipped multiple sensors from which there are new opportunities to analysis user's daily behaviours and also how truly intelligent personal devices are.

They have proposed a MAST (movement, action & Situation over Time) model to explore along this direction and identify key technology required. And also they have found an idea of reducing power consumption for mobile phones with the help of phone-cloud collaboration model. This study shows us a new model known as MAST and it can be very valuable in our survey.

As per [10] Smartphone have lots of resources that can be utilized to enhance user behaviour analysis. Study shows that how Psychological Science can be used to study user behaviour, it gives an idea about various opportunities for analysing Smartphone and it can be helpful in our work.

Below Table1.1 shows comparison of different techniques used to analyse Smartphone user behaviour

Table 1. Comparison Table

Sr. No.	Paper Name	Publisher	Techniques	Merits	Demerits
1	Smartphone usage contexts and sensible patterns as predictors of future sedentary behaviours	Qian He, Emmanuel O. Agu	Here logistic Regression technique is used	1.With the help of logistic Regression they are able to classify user context variable such as location, time and app usage. 2.The paper also shows that users are very sedentary or not, means in other words how much user is spending time as seated.	The paper is only limited to students and student age group only.
2	Smartphone app usage as a predictor of perceived stress levels as workspace.	Raihana Ferdous, Venet osmani, Oscar Mayora	Here predicting a stress level of user based on smartphone app usage technique is used	1. By understanding the patterns of app usage and investigating relationship of these pattern the perceived stress level within the workspace context. 2. The result they have achieved is average of accuracy of 75% and precision of 85.7% can be used as an indicator of over all stress level in work environment.	This paper only show smartphone user stress levels and it is not enough to predict it next move.

3	Machine Learning models for activity recognition and authentication of smartphone users.	S. Sareh Ahmadi, Sherif Rashad, Heba Elgazzer	Here normal technique for security of smartphone and conventional method for same is used.	1. This paper tend to provide a better way to increase security of users data. 2.With the help of seven different physical activities like behaviour biometrics, using smartphone embedded sensor data security is provided in the sense of passwords, personal identification numbers, and pattern locks etc.	The proposed way of security requires 7 daily activates and it leads to more time consumption.
4	Artificial Intelligence and Mobile Phone Sensing based User Activity Recognition	Chia-Liang Chen, Fu-Ming Huang, Yu-Hsin Liu, DaiEn Wu	Here four supervised machine learning technique is used and various classification models are made	1. With the help of logistics regression, and support vector machine automatic activity classification model is created. 2. They have evaluated the prediction performance and the results of these experiments shows that under specific acceptance of accuracy and minimum model training time, the decision tree algorithm creates the best model.	This paper only show the best algorithm for User Activity Recognition but not tend to give an patter or prediction.
5	Identifying smartphone users based on how they interact with their phones	Mohammed A. Alqarni, Sajjad Hussain Chauhdary, Maryam Naseer Malik	Here also they had used the technique of machine learning various algorithms, Gesture recognition and behavioural	1. The maturity in sensor chips and machine learning algorithms provides a better solution for authentication problems based on behavioural biometrics, which aims to identify the behavioural traits that a user possesses,	This paper tends to use more physical activities than use of smartphone itself.

DIRECTOR
Yashoda Technical Campus
Satara

			biometric is also used.	such as hand movements and waving patterns etc. 2. Their research study aims to provide a solution for passive and continuous authentication of smartphone users by analysing their activity patterns when interacting with their phones.	
6	Is Smartphone usage is truly smart? A Qualitative investigation of IT addictive behaviour	Liette Lapointe, Camille Boudreau-Pinnsonneault, issac vaghefi	Here they have used a grounded theory to report the result of addictive smartphone usage.	1. As per the investigation i.e. the 11 depth interviews and answers to 183 exploratory questions they have revealed out of four smartphone user profiles two of these are exhibiting addictive behaviour.	The paper show the study that show if a person is addicted to smartphone or not but it does not specifies it types or any further details.
7	A Smartphone user activity prediction framework utilizing partial repetitive and landmark behaviours	Peng Dai, Shen Shying ho	Here they have made their own technique/algorithm to find a repetitive behaviour of smartphone user.	1. With the help of Activity Prediction Framework they are giving prediction of next day behaviour of same user based on weighted sum of most similar behaviour vectors related to landmark behavour of next day behaviour. 2. With the help of arbitrary call activity, voice call activity, short message activity, media consumption and app usage datatypes, extensive experiment are carried out using nokia mobile data challenge (MDC) dataset to demonstrate the	The study conducted through this paper is based on old datasets that will not be useful that much.
				feasibility of their proposed approach.

8	Usage Prediction and Effectiveness Verification of App Restriction Function for Smartphone Addiction	Katsuki Yasudomi, Toshitaka Hamamura, Masaru Honjo, Akio Yoneyama, Masato Uchida	This is the study paper which focuses on app restriction function.	1. They are focusing on app restriction function, which is one of the key features of digital medicines for smartphone addiction, and analyze the usage of the function and verify its effectiveness. 2. Their results showed significant differences in both psychological and behavioral aspects between those who used the app restriction function and those who did not. Specifically, they found that the app restriction function is more likely to be used by those who were more aware of their smartphone addiction.	The paper show study that only focuses on one method for smartphone addiction.
9	Human Behaviour Impact to Use of Smartphones with the Python Implementatio n Using Naive Bayesian	Iftakhar Mohammad Talha, Imrus Salehin, Susanta Chandra Debnath, Mohd. Saifuzzaman, Nazmun	Here they have used Naïve Bayes theorem to learn impact of hum an behaviour.	1. They have found out the major problem of the human behaviour's negative side and its different sources like mental imbalance, stress, depression, loneliness, etc. 2. With the help of naïve bayes theorem and classifier, support vector machine, special data set of human behavior, and probability are used to calculate accuracy.	The paper only focuses on the accuracy of the system and does not tends to give an specific output to human behaviour with respect to smartphone.

DIRECTOR
Yashoda Technical Campus
6757

10	Human Behaviour Analysis through Smartphones	Kostas Konsolakis, Hermie Hermens, Claudia Villalonga, Miriam VollenbroekHutten	This is also actually a survey paper which is addressing the human behaviour analysis.	1. This paper surveys the state-of-the-art in human behaviour analysis based on smartphones. 2. They have categorize prior works into four main sensing modalities related to physical, cognitive, emotional and social behaviour which will help the smartphone user to improve themselves.	The tends to only understand human behaviour and doesn't tends to use this analysis for Furter prediction proposed or else.

III. CONCLUSION

A. The task of manually performing every search, every navigations involves a quit amount of time and can be also frustrating task.

B. So this study shows us that a simple suggestions that follows the predictions done by the AI can make a difference in users smartphone experience.

ABSTRACT

Medical care related innovation has been developing dramatically, from electronic medical care records (EHRs) and individual wellbeing trackers to populace wellbeing the executive's instruments. Presently, information from these sources is generally chronicled, dissected independently or utilizing just careless coordination with different information sources. In this review, we propose a coupled artificial intelligence Blockchain EHR the executive's framework. The objective is to give a stage that influences blockchain and man-made brainpower (man-made intelligence) for (I) secure EHR the board, (ii) effective information coordination, and (iii) solid PC helped analyze. An objective situated demonstrating approach with the Obliged Objective Model (CGM) is utilized to evoke the framework prerequisites. Survey results for a contextual investigation in Abu Dhabi, UAE served for model approval and refinement for expanding the quantity of framework clients. Electronic Wellbeing Records (EHRs) are electronically-put away wellbeing data in a computerized design. EHRs are ordinarily divided between medical care partners and face power disappointment, information abuse, absence of protection, security, and review trail. Then again, blockchain is the progressive development of the 20th century that offers a disseminated and decentralized setting to convey among hubs in a rundown of organizations without a focal power. It can address the limits of EHRs the board and give a more secure, got, and decentralized climate for trading EHRs information. Three classifications of blockchain-based potential arrangements have been proposed by scientists to deal with EHRs: calculated, model, and carried out. This study zeroed in on an Efficient Writing Survey (SLR) to find and break down articles submitted either reasonable or executed to oversee EHRs utilizing blockchain. The review inspected 99 papers that were gathered from different distribution classifications.

Keywords — blockchain, healthcare record management, artificial intelligence, goal-oriented requirements engineering, AI Artificial Intelligence, Machine Learning, Internet of Medical Things, Machine to Machine, Attribute-based Encryption.

DOI Number: 10.14704/nq.2022.20.11.NQ66386 **NeuroQuantology 2022; 20(11): 3847-3853**

INTRODUCTION

THE fundamental plan of electronic medical care records (EHRs) neglected to expect the requirement for the administration of multi-institutional, lifetime medical care records. The ordinary difference in medical services suppliers renders patient information scantily followed across various sources. Thus, patients frequently need simple admittance to their noteworthy information, while suppliers hold essential possession. Characterizing medical care information trade instruments and pathways is especially difficult, however guarantees profoundly certain inputs for medical services framework activities and clinical exploration [1]. Protection concerns are universal among medical care establishments and are much of the time the primary driver for their shut information strategies [2], alongside the danger of information divulgence to their upper hand.

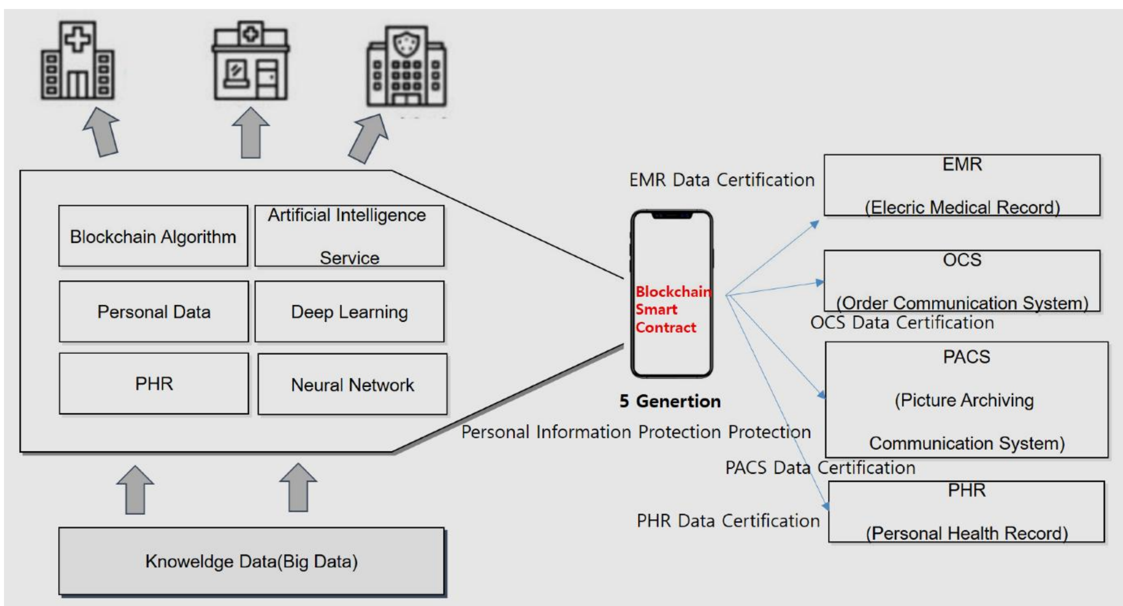

Fig.1:Blockchain based record date management system using artificial intelligence Process.

Lots of medical care information would be exceptionally advantageous for medical services suppliers whenever dissected. These information can help us in battling the infection through clinical help, early notice, and proposal [8]. Notwithstanding, it has turned into a major test for scientists to store and dissect wellbeing information in light of the fact that most are deficient and blemished. In this manner confirmation and approval of such information are pivotal for revealing, and suggestion [6]. Blockchain innovation has incredible possibilities to handle the pandemic emergency. It can assist with building a decentralized information global positioning framework that can be recovered when important. Furthermore, this enormous medical care information, particularly EHRs, is defenceless against protection and security breaks. Beginning from the Coronavirus episode, medical care suppliers and scholastic associations confronted a few complex cyberattacks [1]. The Worldwide Lawbreaker Police Association (INTERPOL) distributed a report about digital assaults connected with Coronavirus in April 2020.2 Medical services ventures have been seriously impacted close by others by these assaults. On 6 May 2020, INTERPOL delivered a mindfulness crusade where different digital assaults during pandemic were listed.3 accordingly, it is significant to do whatever it may take to handle these dangers.

Medical care record information is the essential wellspring of data and the establishment for clinical examination.

Satara

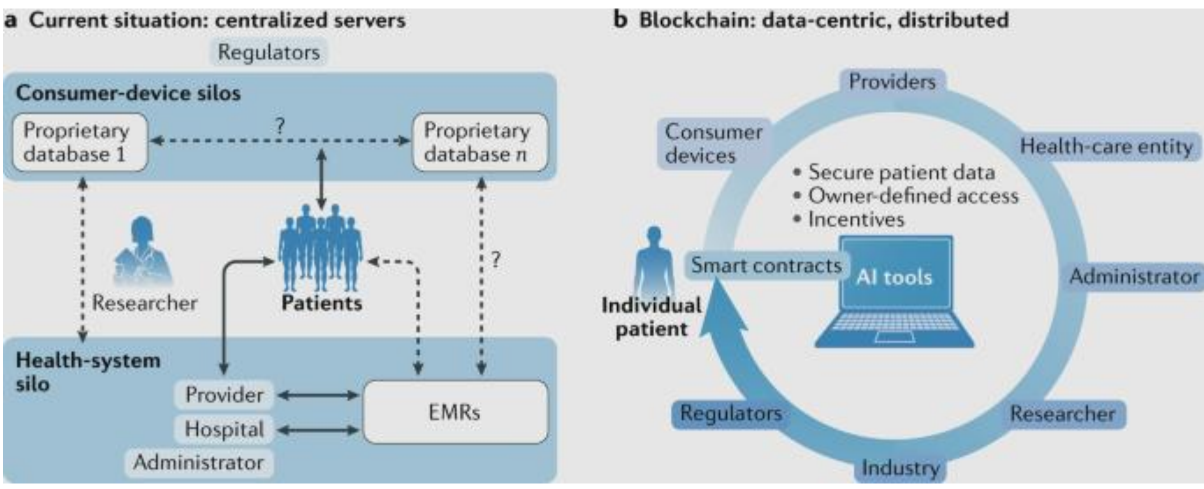

Fig.2: Blockchain based record date management system using artificial intelligence Structure.

Ebla et al. [7] accentuate that clinical and medical care analysts depend on their capacity to get to and examine multi-source information to evaluate potential collective wellbeing gambles, propose case-subordinate therapies and designated medication. While sensible measures of information are made accessible for research from clinical preliminaries, censuses and college subsidiary clinics, a striking expanding interest in huge scope information trade exists across different key partners [8]-[1]. The point of this study is to frame the objectives and necessities for a coupled man-made intelligence blockchain EHR the board structure. The work depends on survey criticism from three emergency clinic bodies across the UAE and applies the Obliged Prod Demonstrating (CGM) approach with its related CGM-Device [1] .The general progress of the framework relies basically upon the client movement - the quantity of exchanges. Notwithstanding, the proposed framework is intrinsically made out of numerous goals, capabilities, and partners.

Model fundamentally not the same as the authorization less mining in the Medrec system. They decided to create a shut, access-controlled blockchain EHR framework from a clinical perspective. This thusly elaborate the reception of distributed storage and access key exchanges for encryptions, though Medrec put away tolerant information locally at each hub. In both the consent less and permissioned models, the benefit of adding simulated intelligence to the structure of a blockchain EHR the executives framework, has not been completely understood, even in the latest writing.

FRAMEWORKS

Blockchain innovation is a relationship of two advancements, cryptography, and P2P. A blockchain is a progression of timestamped blocks associated through a cryptographic hash. Regularly each block contains exchange records confirmed by the friends, called excavators. The chain is expanded consistently, and each new block is added as far as possible. Be that as it may, each new block contains a reference, essentially a cryptographic hash (e.g., SHA-256), of the past block's header. The making of each block guarantees secrecy, straightforwardness, and unchanging nature [5]. The entire situation of blockchain is held in a P2P organization. The essential construction of a blockchain. Each block with the exception of the beginning block (first block of the organization) has the hash worth of information from the past hash. Moreover, each block has a trouble esteem called Nonce, a Timestamp, and different qualities (e.g., the rundown of exchanges).

DIRECTOR
Yashoda Technical Campus
Satara

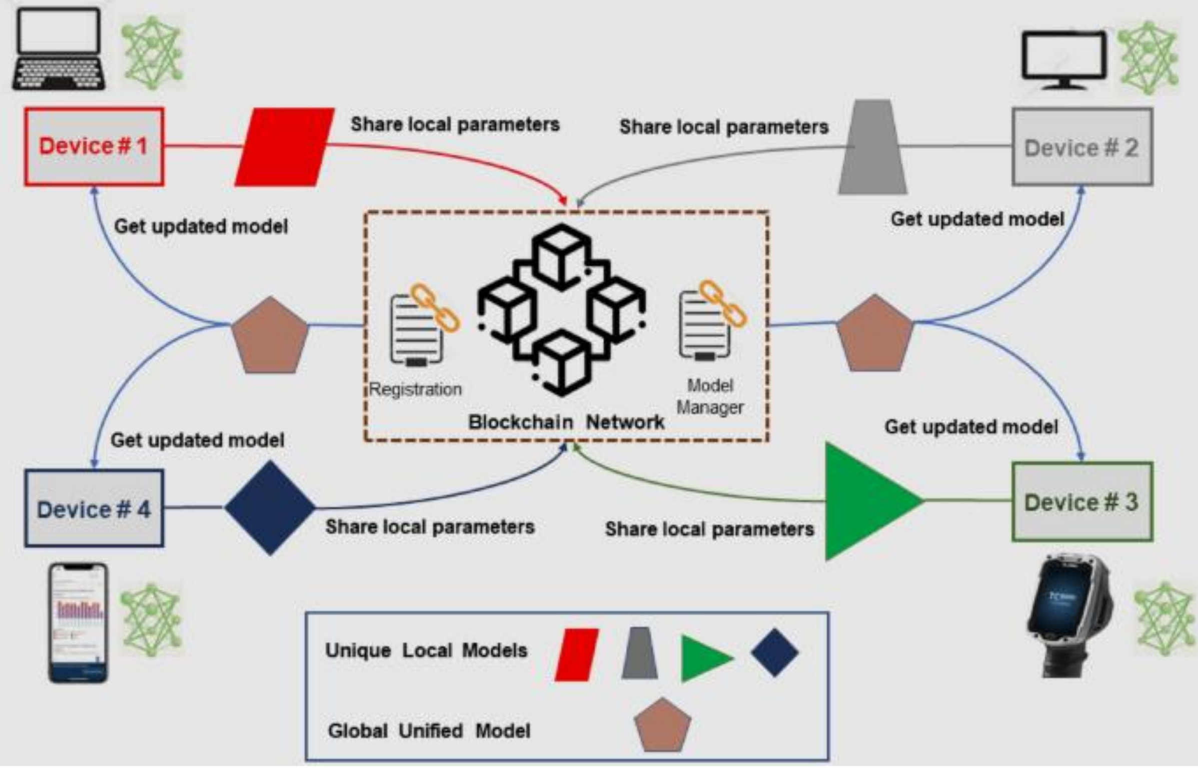

Fig.3: Blockchain based record date management system using artificial intelligence Flow.

Displaying and Information Examination the CGM was arrangement as per the stepwise methodology nitty gritty in [1] and [7]. The initial step was characterizing the objectives, refinements, and area suppositions, backed by understanding the CGM. The third step was contributing inclinations and checking great formedness. Following the finishing of stages 1 and 2, the instrument is pursued contributing inclinations to actually take a look at all kinds of situations. The "Actually look at Well-Formedness" capability, implanted in the CGM apparatus, is applied to evaluate the quality and legitimacy of the applied model, making sure that all components and their relations are appropriately connected. The mistakes to check are named "Void Chart", "Invalid Objective Hub", "Refinement Legitimacy Check", and "Undeclared Variable" [7]. The model produces situations subsequent to checking for consistency. Given the impediment of information and partner crowd, the last step of choosing the most sensible acknowledgment, as indicated by partner inclinations [7], was not performed here. The survey [8] filled in as the fundamental reference for evaluating and approving the proposed model in distinguishing the basic partners and their assumptions from using the proposed EHR the board framework.

PRIVATE BLOCKCHAIN

Confidential Blockchain has a few similitudes with a public one regarding activity and calculations. Nonetheless, it contrasts in reason. In basic terms, a private blockchain is a prohibitive or permissioned blockchain. It is worked in light of some entrance control rules in a shut organization, which is circulated at this point unified. This sort of blockchain is normally utilized inside an association or organization where at least one hubs control which hub can perform exchanges, go about as diggers or perform savvy contracts. The security, openness, consents, and approval are constrained by a TTP association.

Satara

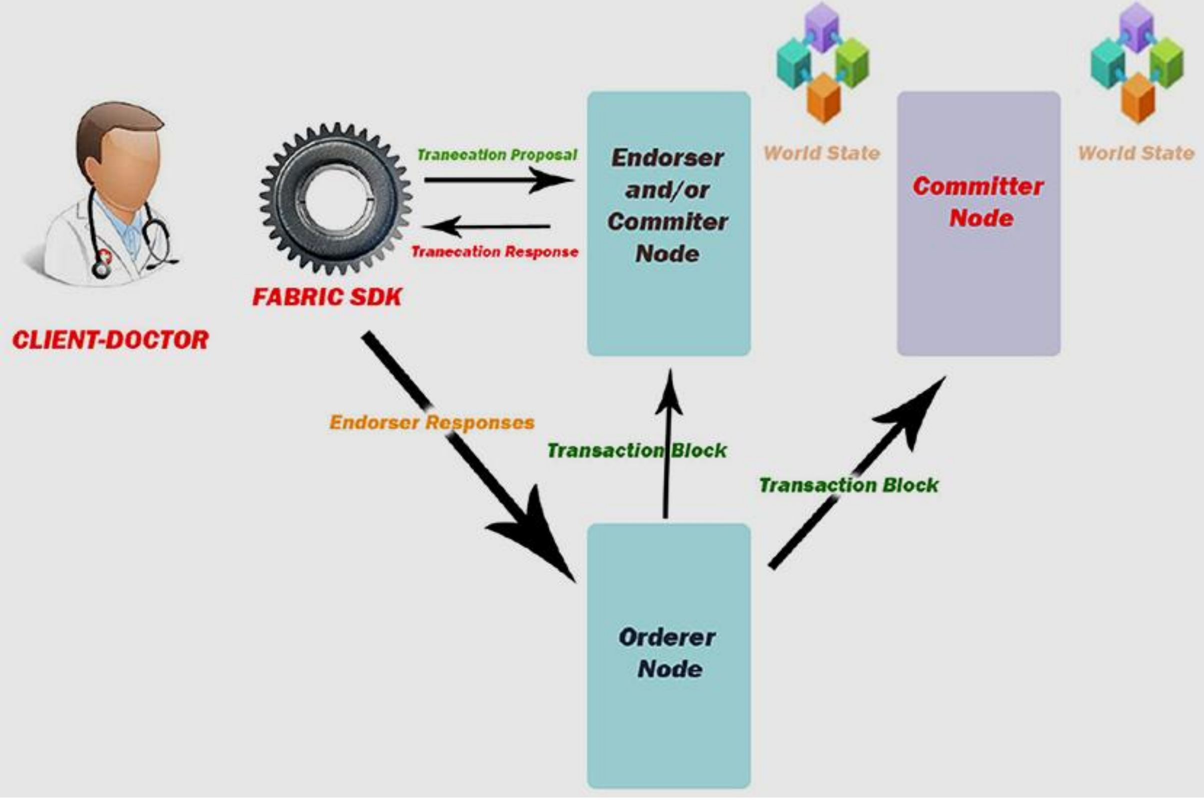

Fig.4: Blockchain based record date management system using artificial intelligence.

This kind of blockchain is utilized regularly for store network the board, electronic democratic, advanced resource the executives, and information protection. Hyperledger Texture [9] and Wave [2] are brilliant instances of private blockchains. It's not possible for anyone to join a private blockchain network without a greeting from approved faculty. Moreover, it consumes less power than the public blockchain, and it is quicker in adding blocks to the chain. Subsequently, a private blockchain is recommended to oversee EHRs.

RESULTS AND DISCUSSION

The aftereffects of the CGM instrument demonstrating show the obligatory parts and their interlinkages to inspire the achievement pathways of the proposed structure. The essential practical necessity was Augmenting Utilization of HR Blockchain Framework. Five significant level middle objectives are characterized as: Implementing Blockchain, Giving Devices, Expanding Security, Diminishing Exchange Expenses, and Expanding Interoperability, alongside the accompanying non-practical (pleasant to-have) necessities: New Positions, Engaging Youth, Worked on General Wellbeing, Getting Close Family HRs, and Decreased Exchange Time. The general model is portrayed, which represents the principal prerequisites and their interconnections for expanding the utilization of the blockchain EHR framework. Meanings of Prerequisites, Moderate objectives, Undertakings, Area Suspicions, and Refinements can be found in [1] and [7].

Transitional objectives, undertakings, as well as space suppositions that, together, uncover the intricacy related with sending a fruitful simulated intelligence blockchain EHR the board framework. Tending to Q2, the obligatory necessity of Boosting Utilization of HR Blockchain Framework was seen diversely by the poll responders. Patients were more worried about their ownership of full control of their medical care records, while others focused on the coordination of their own information (for example from wellness devices and versatile applications) with their medical services records.

DIRECTOR
Yashoda Technical Campus
Satara

Situation Age the created model and its acknowledge were evaluated in view of the gathered reactions from the survey. Tending to Q1, the key partners got from the survey input and, subsequently, from the CGM graph of Figure 1 can be distinguished as follows: The UAE Government, including the regulation bodies and medical services guideline organizations (for example HAAD for the Emirate of Abu Dhabi), Emergency clinic Bodies, Medical services specialists, IT specialist co-ops (organizations and individual specialists), blockchain specialists, insurance agency, clinical focuses (Facilities), drug stores, and the overall population, explicitly patients. The model exhibits the centrality of participation between the referenced players for the achievement the proposed framework. The partner rundown will normally grow as the middle of the road objectives are refined past the extent of the current review, which fills in as a starter structure.

Medical services professionals distinguished more information sharing for clinical exploration just like an area of exorbitant interest. Clinic IT and information base (DB) supervisory groups distinguished information interoperability, precision and exchange time as their key worries. While not unequivocally recorder in the study, the major drivers for taking on blockchain in the UAE is the public authority's consistent endeavors toward mechanical progression and advancement [9]. A sum of thirteen anonymized review reactions were recorded. Regardless of the low return rate, the reactions served the model turn of events and investigations. Concerning looked in acquiring patients' EHRs, reactions included: missing data, conflicting configuration, and long exchange times. None announced sharing patient information for research purposes, albeit all reactions demonstrated their dynamic support in clinical exploration. There was consistent assent that patients ought to have sole command over their medical services records, with the state of a predictable, secure and organized climate gave.

ALGORITHMS FOR BLOCKCHAIN

The agreement calculation is a dynamic cycle in a gathering of hubs in the blockchain which should be trailed by the other hubs. To comprehend this exhaustively, let us think about the accompanying model. Assume there are 20 individuals in a conference to settle on an impending task. Everybody can propose their own perspective with respect to the undertaking, however the prospect that benefits a great many people will get a higher inclination. Essentially, in the event that we think about a digital money, e.g., Bitcoin, the excavators need to settle numerical riddles to meet POW agreement and get a few compensations as Bitcoin. In many blockchains, agreement calculations are the vote of larger part members.

CONCLUSION

The current review gives a primer structure to evoke the different intricacies and interdependencies in the execution of an artificial intelligence blockchain framework for EHR the board, explicitly in the UAE setting. CGM is demonstrated to be an important device in determining, planning, explaining, and modifying complex framework necessities. Five undeniable level middle objectives are characterized as: Upholding Blockchain, Giving Devices, Expanding Security, Lessening Exchange Expenses, and Expanding Interoperability, to fulfill the obligatory prerequisite of an effective EHR the board framework, alongside a sum of 22 undertakings. Different non-useful necessities were likewise caught: New Positions, Engaging Youth, Worked on General Wellbeing, Getting Close Family HRs, Diminished Exchange Time,

YASHODA TECHNICAL CAMPUS 6757 SATARA

Yashoda Technical Campus
Satara

while a few others might be become clear with additional refinement. Utilizing the underlying outcomes from the system proposed in this review, the future work on growing the examination by refining the objectives and errands with the distinguished partners is suggested. An administration embraced study is recommended to guarantee more extensive cooperation of medical services foundation for additional definitive and delegate discoveries. In the long run, a rundown of potential medical services organizations can be recognized to execute and test a functioning model of the proposed framework, as in [1] and [5]. We will likewise additionally broaden the displaying past the objective examination to envelop full necessities detail [3], and influence our past specialized work in the blockchain region

ABSTRACT

For many years man has been in need of energy and he has been using it to a great extent for prosperity and sustenance. This use was responsible for lot of energy wastage. The usage energy for foot strength with movement of every human is very important for high density countries such as India, where crowded around runs on the clock. Kinetic energy using harvesting is a sustainable method for generating electricity without harm to natural resources. This study focus on harvesting of walking energy and compare with different technology used for converting walking energy into electrical energy. For this project we have chosen temple location as crowded place. The name of temple is Shri Vadjai Devi Temple at Patkhal.

Keywords: Energy Harvesting, Piezoelectric Sensors, Kinetic Footsteps, Vadjai Devi Temple, Sheet Metal. Kinetic Energy.

I. INTRODUCTION

In past few decades it has been noticed that the one way of generating energy must change due to its harmful effects on the global climate. Energy harvesting is one of the emerging methods. It is the method in which kinetic energy is converted into electrical energy. This kinetic energy is generated from human footsteps falling on a mechanical tiles. These tiles have mechanism in which there are piezoelectric sensors. These piezo sensors captures kinetic energy from human footsteps which is wasted energy. Then it is converted into electrical energy and stored for later use. Without wasting natural resources, energy harvesting is one of the promising techniques for facing the global energy problems. Harvesting energy is a developed methd from a small power generation system which refers to milli-watts. This method is for replacement or augmentation of the batteries. The kinetic energy harvesting that is the purpose of study, converts movement, mainly in form of vibrations, into electrical energy.

Kinetic energy: kinetic energy is a form of energy that an object or a particle has by reason of its motion. For example – a person walking. Kinetic energy having different types such as Thermal Energy, Sound Energy, Mechanical Energy, Electrical Energy.

Kinetic footstep: kinetic footstep **(Fig.1**) is an eternal energy source for the generation of electrical energy without usage of any natural resources.

Fig 1: Kinetic footstep

Volume:04/Issue:05/May-2022 Impact Factor- 6.752 www.irjmets.com

Location: We have selected shri vadjaidevi temple **(Fig.2)** in patkhal village for project survey. This temple was built about 90 years ago.

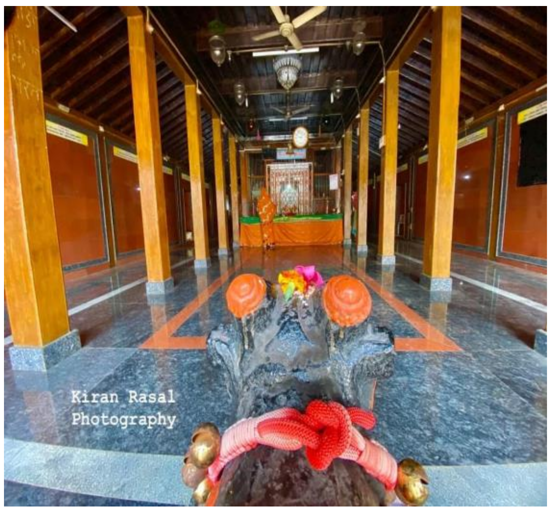

Fig 2: Shri Vadjaidevi Temple

II. OBJECTIVE

- To select the suitable site
- To create piezoelectric tiles
- To generate renewable, electrical energy by using kinetic footstep

III. MATERIALS

1. **SHEET METAL:** sheet metal is metal formed by an industrial process into thin, flat pieces. Having gauge 0.16 and size 1.15*1.5 feet with black in color.

Fig 3: Sheet Metal

2. **PEIZO SENSORS:** Piezoelectricity is the charge created across certain materials when a mechanical stress is applied. Piezoelectric pressure sensors exploit this effect by measuring the voltage.

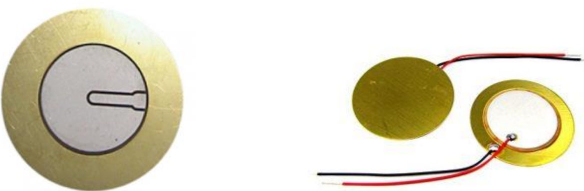

Fig 4: Piezoelectric Sensors

3. **BATTERY:** The capacity of the battery is given for a specific discharge current.

Fig 5: Battery

4. MULTI STRAND WIRE: The Multi-strand wires come with a bunch of small wires. This wire bunched together to form one thick conductor. This wires are more malleable than single strand wires.

Fig 6: Multi Strand Wire

5. RESISTROR: A resistor is a 2-terminal passive electrical component that is used in the project for electrical resistance as usual. Its other applications in the proposed circuit are to reduce current flow.

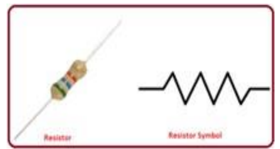

Fig 7: Resistor

6. CAPACITOR: A Capacitor is a 2-terminal passive component that has the ability to store electrostatic energy between its 2-plates.

Fig 8: Capacitor

7. BREADBOARD: A breadboard is used when printed circuit board is not created. We can change and move circuits on PCB. Breadboards are used for designing.

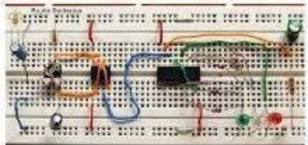

Fig 9: Breadboard

8. LED: A light-emitting diode (LED) is a semiconductor light source device which has tendency to emit light when current starts flowing through it. Electrons in the semiconductor recombine with electron and holes pair, releasing the energy in the form of photons thus emitting light.

Fig 10: LED

9. DIODE: It consists of two-terminal in which current flows in single direction. Its resistance is low in primary direction, and high in the other. In reverse bias it behaves as a conductor.

IV. METHODOLOGY

1. **Study of piezoelectric material and power generating floors**
2. **Study of flooring construction methodologies**
3. **Implementation 0f piezoelectric energy generating circuit in the flooring**
4. **Test on model**

We propose method of piezoelectric sensors to be used in implementing a power floor. Piezoelectric sensors are special type of sensors which when subjected to pressure produce AC voltage. The voltage is generated because of formation of dipoles in the material. Equal and opposite charges are deposited on opposite surface. This leads to a potential difference between the surface which is tapped as electrical energy.

The projection on the tile surface come in contact with the piezo material and hence applies force on it. The applied force produces stress inside piezo material which will produce current. There is clearance of 0.5 cm in between the springs and tile surface. The spring is provided for stability as well as protecting the piezo material from getting damage by excess load applied. **(Fig.12 & Fig.13)** shows the system model.

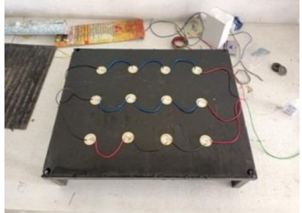

Fig.12

Fig.13

V. RESULT AND DISCUSSION

- **Calculation**

➢ **Power generating in one step**

1 step generate voltage = 6V

Current = 5 mA (from one series of sensor)

For three series of sensors = 5*3 = 15 mA

Now,

P= V*I = 6*15*10^-3

P= 90 mW

➢ **Steps require to get battery fully charged**

(Battery- 6V & 4.5 A.H)

P= 6*4.5

= 27 Watt (in 1 hr)

Table showing comparison between three different no of series of sensors attached to the tile

Table no.1 Comparison of series

Sr.No	No. of series	3	5	10
1	Power generate from one step	90 mW	0.15 W	0.3 W
2	Step require to charge battery (6V)	10,80,000	6,48,000	3,24,000
3	Steps require for one unit of electricity	40*10^6	24*10^6	12*10^6

VI. CONCLUSION

- Our aim is to produce renewable energy using piezoelectric sensors by being more interactive than other renewable energy while produce meaningful data.
- We have selected a suitable location for project. The choosen location is Shri Vadjaidevi Temple at patkhal.
- We are using piezo sensors for generating renewable energy without depleting any natural resource.
- We have connected three no of series of sensors for the tile. It requires 10,80,000 steps for battery fully charging.

Abstract
Designing a structure to sustain during an earthquake makes it very uneconomical, as the earthquakes may or mostly may not occur in entire lifespan of building since it is inconsistent phenomena. In this paper a G+4 RCC building is designed in zone III and zone IV by using STAAD Pro software. Various characters like lateral displacement and storey drift will be studied. The main aim of this paper is to think on variations in RCC members, most extreme shear power, greatest redirection all these factors shows increase from zone III to zone IV.

Keywords: *Seismic zones, STAAD PRO, Lateral Displacement, .*

Date of Submission: 05-06-2022 Date of acceptance: 20-06-2022

I. INTRODUCTION

Designing structure with the help of STAAD Pro V8i which is referenced to IS 1893(PART 1): 2002 "Criteria for Earthquake Resistant Design of Structure" ensures that building has minimum strength to withstand minor earthquake occurring frequently and resisting moderate earthquakes without significant structural damage. This document is presented to improve the productivity of sustained earthquake mitigation strategies and the capacity to secure structures, frameworks, to Investigate a multiplex RCC operating for open shaking strength to think about the effects of different seismic zones, Knowing the relationship between different procedures for seismic inspection and their seismic response, gain useful learning in basic inspection, seismic assessment, drafting and identification of auxiliary parts using earthquake resistant design norms. We are also configuring the G+4 custom build, it means that if the zone changes from zone III to zone IV, the structure planned by us at that point will be fixed. Also, by calculating this we will perceive the amount spent putting together such a structure.

Seismic tremor shaking is irregular and varies with time. Be that as it may, most plan codes speak of inertia forces caused by jolting as the net effect of arbitrary jolts, such as static parallel power proportional to the structure. This strength is called the seismic design base shear VB and remains the base quantity associated with the strength-based earthquake resistant structure of structures. This strength is based on the seismic hazard in the area of the structure spoken by the seismic zone factor z. The codes reflect this by presenting a flexibility factor sa/g. This way of thinking is presented with the help of the response reduction factor r, which is larger for flexible structures and smaller for weak structures. Therefore, the seismic shake claim plan is evaluated solely on the basis of probabilistic ideas and the earthquake effects plan is called a seismic shake safe structure against reasonable estimate of interest. The design base shear VB was taken according to the Indian seismic code is 1893(part 1)-2007.

1.1 Basic Design Codes

Design should be carried so as to confirm to to the following:
1. IS 456: 2000- Plain and reinforced concrete- code of practice (fourth revision)
2. National Building Code 2005
3. Loading Standards IS 875 (Part 1-5): 1987- code of practice for design loads (other than earthquake) for buildings and structures (second revision)
Part 1: Dead Loads
Part 2: Live Loads
Part 3: Wind Loads
Part 4: Snow Loads

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Part 5: Special Loads and load combinations

1.2 Design Handbooks

SP 16: 1980- Design Aids (For RCC) to IS 456: 1978
SP 24: 1983- Explanatory handbook on IS 456:1978
SP 34: 1987- Handbooks on concrete Reinforced and Detailing.

1.3 STAAD Pro. V8i

Structural Analysis & Design is used to create the model which would then be able to investigated, analysed & designed. After examination and configuration is finished, the GUI can likewise be utilised to see outcomes graphically. It is a general useful census for auxiliary inspection and combines of Steel, concrete, Timber and aluminum construction. Its adaptability for different codes of design makes it versatile.

II. OBJECTIVES

2.1 To design G+ 4 structure for zone III & IV on STAAD Pro.
2.2 To compare the behavior of framed structure in seismic zone III & IV.
2.3 To make a total plan of the main auxiliary components of a specific structure & find out steel increment.

III. METHODOLOGY

3.1 Creation of node foci: Considering the centreline layout of the plan, we entered the hub documents into the STAAD document.
3.2 Representation of bars and segments: Using the inclusion bar layout, we plotted between beams & columns.

3.3 3D perspective on the building: Here we used the transition repetitive pattern in the Y header to get a 3D perspective on the structure.

3.4 Supports and property: After the formation of the structure, the supports at the base of the structure are specified as fixed. Likewise, the Materials were determined and the cross segments were distributed to the individuals.

4 3D render view: After feature clustering, a 3D rendering perspective can be viewed on the structure.

5 Assignment of seismic loads: We have defined the seismic loads specified in the IS1893:2002 code with appropriate ground loads in order to disable seismic loads instantly. Loads are included load case subtleties in +X, -X, +Z, -Z headings with determined seismic factor.

6 Assignment of wind loads: Wind loads are characterized according to IS 875 Part 3, depending on the determined power and input factor.

7 Assignment of dead loads: For external dividers, internal dividers, parapet dividers, constant loads including the self-weight of the structure are determined in accordance with IS 875 part 1.

8 Assignment of live loads: Live loads are relegated for each floor as 3 KN/M^2 dependent on IS 875 PART 2.

9 Adding of load combination: After all batches have been dropped, batch mixes are given with the appropriate factor of safety in accordance with IS 875 Part 5.

10 Analysis: After all the above progress paid off, we played out examination and checked for errors.

11 Design: Finally, the solid plan proceeds according to IS 456:2000, characterizing the appropriate plan orders for the various key segments. After the allocation of orders, we investigated whether there were errors again concrete design.

12 Report: After no error found the reports are downloaded and same procedure is repeated but this time with different Seismic Zone.

After following the above specifications the structure is designed for the Seismic zone III. Since, the same structure can be designed for Zone IV only with minor alterations in the Seismic Load case and reports can be compared.

IV. SIMULATION

V. CONCLUSION

5.1 Total 2.47% more steel is require to design the structure from Zone III to Zone IV.
5.2 Maximum nodal displacement is increased by 8.33mm showing more horizontal forces in higher zone.
5.3 Maximum bending moment is increased by 30.84 kNm results in more steel in beam section.
5.4 Maximum shear forces increased by 15.32 kN resulting in additional 1.3% shear reinforcement in zone IV.
5.5 After analyzing the G+4 storey building structure, it was concluded that the building is safe under dead load, wind load and seismic loads in both zones if additional 2.5% reinforcement is provided.

ABSTRACT

Water hyacinth (Eichhornia crassipes) is rapidly growing plant that affects aquatic plant, animals, ecosystem, navigation etc. It is also block water ways, decrease amount of dissolve oxygen. The growth rate of Eichhornia crassipes can be controlled by using chemical, biological and mechanical methods. In chemical method herbicides are use but they adverse effect on living things. Biological method is too much lengthy process & available mechanical method are very expensive. Hence the goal of our project is to develop the economical equipment to remove water hyacinth from water bodies at Ganpati ghat of wai. Equipment consist of 60&300 rpm 12 V DC motors, base frame 101cmX56cm, pvc pipes (Dia-75&140mm), bearing, shaft, conveyor belt, 12V battery, propeller.

Keywords: Water Hyacinth, Mechanical Removal, Ecosystem, Eichhornia Crassipes.

I. INTRODUCTION

Nowdays water hyacinth seems very critical problem water hyacinth is originated in the amazon basin and spread throughout the world its growth potential is very rapid as compared to any other aquatic plants its leaves are thick and ovate in shape this are 10 to 20cm across on the long stalk it has unbranched roots and also consist root cap it reproduces with both sexually as well as vegetative propagation Its profilic growth date causes blockages in water bodies it is problematic for navigation and entire aquatic life its also causes depletion of basic oxygen level in water bodies and contamination of water.

Fig 1: Water hyacinth mat at Krishna river Wai

There are some mechanical, chemical & biological methods are already available to remove water hyacinth. Mechanical method is very expensive so it is not convenient to in rural areas and chemical method consist use of chemicals has we know chemicals has adverse effects on the rest of the aquatic animal and plants as well as contaminating the water.

Volume:04/Issue:05/May-2022 Impact Factor- 6.752 www.irjmets.com

So we have developed a low cost equipment that removes water hyacinth effectively this equipment is easy to handle. It has multi purposes like with the help of air diffuser we see increase in level of dissolve oxygen in water body.

II. LITERATURE REVIEW

1. Design and fabrication of automatic water hyacinth removal and prevention machine by Gudlavalleti Deepak kumar, B Ananth Shrrecharan , T. Sai Kiran, S.S Sandeep, muli s.

In this paper they design the automatic water hyacinth and prevention machine. The machine most designed and powered by 48V DC single phase motor with speed of 270 rpm which will increase physical control of the weed. The major chain drive , rail boat, (48V), remote controller etc.

A seed sprinkler is working in this system which aids in the biological control of the machine by throwing seeds into the water bodied which prevents the water hyacinth from growing to an area.

2. Fabrication of water Hyacinth harvester by Mr. V. Shantha Moorthy, M.E., Assistant Professor, Department of Mechanical Engineering .

The aims of the project to develop a water hyacinth mechanical model which is a short term control measure. In this model harvester can be used to remove water hyacinth in the water bodies.

It is recognize that mechanical control method he then effective way of controlling the water hyacinth. This paper aimed at reducing manual work to removal the water hyacinth there by reducing labour cost involved. This decrease the blockage in water ways and continue the quality of water.

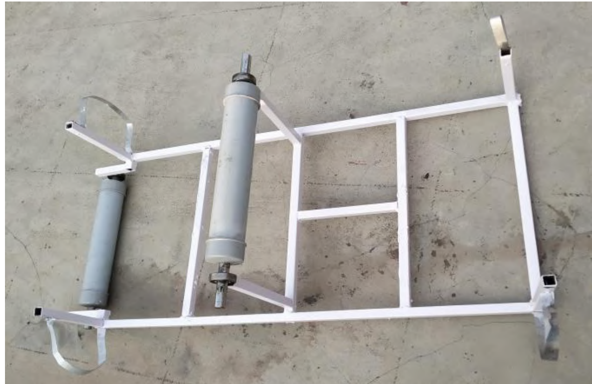
III. OBJECTIVES

1) To study the physical property of water hyacinth.
2) To take test on water (pH, acidity, alkalinity, hardness, dissolved oxygen etc.
3) To make suitable equipment from removing weed as well as cost effective.
4) To remove water hyacinth from krishna river at wai.
5) To calculate benefit cost ratio for utilization of society.

IV. COMPONENT AND SPECIFICATION

A. BASE FRAME:- A base frame is made from fabricated MS square pipes.

Specification:- Length=101cm, Width=56cm, Square pipe size=2cm x 2cm.



B. PVC PIPES :- There are two pvc pipes are used to float the equipment.

Specification:- Length=110cm, Diameter= 14cm.

C. SHAFT:- Shaft are used to transmit the power from motor to conveyor belt.

Specification:- Length=58cm, Diameter= 1.5cm.

D. MOTOR:- A DC Motor is a electrical machines that converts direct current electrical energy into mechanical energy.

Specification:- RPM=60.

(Peer-Reviewed, Open Access, Fully Refereed International Journal)
Volume:04/Issue:05/May-2022 Impact Factor- 6.752 www.irjmets.com

E. BALL BEARING:- A ball bearing are used to reduce rotational friction and support radial and axial loads.
Specification:- D1= 1.5cm, D2=5cm.

F. CONVEYOR BELT:- Conveyor belt are used to pull water hyacinth from river.
Specification:- Length= width=

G. COLLECTING TRAY:- The main purpose of collecting tank is to collect water hyacinth from the conveyor belt.
Specification:-

H. BATTERY :- The aim of battery to give the power to the equipment.
Specification:- 12 V 9.2 amp ups battery.

Volume:04/Issue:05/May-2022 Impact Factor- 6.752 www.irjmets.com

V. METHODOLOGY

Major the volume covered by water hyacinth:

By using tape measure the volume covered by water hyacinth, (3.05Mx1.83Mx0.40m) =2.23 cubic meter.

Study the physical property of water hyacinth:

Water hyacinth has thick leaves, length of leaves is about 12 to 20 cm. plant consist of 6 to10 leaves. Height of plant is 40 to cm.

Take test of water and calculate result:

1. pH value of water sample:

1. Before to test the water sample calibration of pH meter is done with the help of standard pH solution.
2. Take 100 ml capacity beaker rinse it by distilled water dip pH electrode in distilled water.
3. Take 100 ml capacity beaker rinse it by water sample dip pH electrode in it.
4. Adjust the coarse and fine knobs to show on digital display the constant reading pH.
5. Take at least 3 readings. Calculate the mean pH value of water sample.

Fig 2: pH meter

Sr. no.	pH reading on digital display
1	6.56
2	6.52
3	6.58
	Mean = 6.55

We get pH value is 6.55.

i.e., water sample is slightly acidic in nature.

Volume:04/Issue:05/May-2022 Impact Factor- 6.752 www.irjmets.com

2. Total Hardness by EDTA method:

1. For making EDTA solution we took 20 ml distilled water with 0.336 gm EDTA solution and 100 ml parent water.
2. For buffer solution 20 ml distilled water with 35 ml NH_3 and 5.49 ml NH_4Cl.
3. Take 25 ml water sample with buffer solution then add Eichrome black T- indicator after mixing this solution we get pink color by titration with EDTA solution color turns pink to sky blue.

Observation table:

Burette level	Burette reading (ml)			Constant Burette (ml)
	I	II	III	
Initial	11	11	11.6	11.20
Final	7	7	7.2	7.06

hardness ranges between 120–180 mg/lit. hence, it is moderately hard water.

3. DISSOLVED OXYGEN IN WATER SAMPLE:

1. Take a known volume of water sample in BOD (300 ml) bottle to avoid the contact of water sample with air
2. Add 2 ml of $MnSo_4$ solution in the water by using pipette. Also add 2ml of alkaline iodide-azide solution to it.
3. Shake the solution thoroughly and allow the brown precipitate of $MnO(OH)_2$ formed to settle down
4. Now add 2 ml of conc. H_2SO_4 with the help of pipette. Mix the solution again till the precipitate is completely dissolve. The characteristic brown color of iodine appears due to the liberation of iodine
5. Transfer the solution in 250 ml flask and titrate the liberated I_2 with standardized sodium thiosulphate solution until the solution becomes pale yellow.
6. Add 2 ml of starch solution, solution will turn to blue color.
7. Continue the titration till the blue color disappear.
8. Repeat the experiment to obtain concordant readings.

Observation Table:

Sr. no.	**volume of water sample**	**Burette reading**		**Volume sodium thiosulphate used**
		Initial reading	**Final reading**	
1.	**25 ml**	**0.8 ml**	**0.8 ml**	**0.025 N**
2.	**25 ml**	**0.8 ml**	**0.8 ml**	
3.	**25 ml**	**0.8 ml**	**0.8 ml**	

We get dissolved oxygen value is 1.6 ppm

i.e., dissolve oxygen range below 4 ppm

It is gravely polluted water.

Fabrication of Model:

- By using 2cm*2cm ms. sq. Pipe we made fabricated frame of size 101cm *56cm.
- Fixed a 15mm dia. Stainless steel shafts with the help of 4 bearings.
- Nylon net is use as a conveyor belt for pull out the water hyacinth.
- Two pvc pipes are fitted to base frame for floating the equipment.
- For the rotation of conveyor belt 12 V 60 rpm DC motor used.
- Installed two motors of 12V 60 rpm DC for moving equipment ahead.
- Installed 12V 9.2 Amp battery for power supply.
- The nails were fitted at the front of base frame to moving the weed.

VI. CONCLUSION

The following conclusions had been observed from the experimental results:

- The purpose of this project is to remove water hyacinth in low cost and best performance.
- This equipment is light weight so it can easily float on water & it requires less energy for running & performance will increase.

DIRECTOR
Yashoda Technical Campus
Satara

- This method is more effective than other methods.
- As propellor rotates aeration process is done and dissolve oxygen are increase.
- As we remove water hyacinth using this equipment it increases biodiversity of aquatic ecosystem.
- It is also multipurpose to collecting floating debris, plastic bottles etc.

VII. FUTURE SCOPE

1. After completion of above project, it is noted that, this was prototype we can make such machine on large scale.
2. This machine used to remove water hyacinth in large scale.
3. Water hyacinth is produced on large scale where water is in steady state also where industrial pollution is more so there, we can use such type of machine to control water pollution and increase dissolved oxygen in water.
4. In future we can use solar panel to produce electricity for motor to run the machine.

ABSTRACT

The purpose of our project is to make replacement for cement in paver blocks and to make cost effective than standard paver blocks. Nearly 9.46 million tone of plastic waste generates annually in India. As degradation rate of plastic waste is a slow process hence it requires more time for degradation or does not degrade. Hence our project is useful in proper managing of plastic waste in a environment friendly manner. In this project plastic waste used was of LDPE and PP type with addition of quarry dust, coarse aggregate and ceramic waste. The paver blocks were manufactured, tests performed on it and results were discussed. Sample of 180x150x50 mm size are prepared to evaluate different physical and mechanical properties, tests like water absorption test, compression test, oven test, hardness test, are carried out as per IS specifications on plastic paver blocks. The results obtained have shown good results.

Keywords: Recycle, Plastic Waste, Ceramic Waste, Paver Blocks. Shuttering Ply, Cost Effective, Compressive Test, Water Absorption Test, Hardness Test.

I. INTRODUCTION

Plastic is described as artificial or semi-artificial substances which can be polymeric and are composed of massive molecules of organics materials referred to as monomers. The large molecules that are from the during a process known as polymerization are known as polymers.

As there is a increase in population as well as urbanization and development, which is the main reason for increase in plastic waste. As the plastic waste is non-biodegradable, problem of disposal of plastic waste arises highly. To overcome this situation we can use the plastic in construction sectors as a raw material in different ways like by preparing tiles, bricks and pavements.

Paver block is aesthetically desirable in appearance, economical and has low maintenance, if properly manufactured. Recycling of plastic waste and its use in construction works gives an alternative to another materials which leads in conservation of environment.

CATEGORIES OF PLASTIC:

A. **Recyclable Plastics** (Thermoplastics): PET,HDPE, LDPE, PP, PVC, PS, etc.
B. **Non-Recyclable Plastics** (Thermoset & others): Multilayer & Laminated Plastics. Bakelite, Polycarbonate, Melamine, Nylon etc.

- **Recyclable Plastic:**

1. **LDPE (Low Density Poly Ethylene)**
2. **HDPE (High Density Poly Ethylene)**
3. **PP (Polypropylene)**

II. LITERATURE REVIEW

1. Aarti Ghude1, Ram kant2, Parv Jaiswal3, Avish Dhomne4, Akash Thool5, Sanjal Nandanwar6, Neha Ghumde7, Komal Bele8.

In this research paper mentioned above, the study on the management of plastic waste is done by using it in the manufacturing of the paver block. Recycling of plastic waste and its proper disposal is achieved in a innovative manner.

2. **Nivetha, C. Rubiya, M. Shobana, S. Vaijayanathi, G. (2016). Production of Plastic Paver Blocks from Solid Waste.**

In this paper study on the replacement of cement by plastic waste as a binding material in manufacturing of paver blocks was done.

III. MATERIAL USED AND MIX RATIO

A. Material used for making of Paver mould –

Shuttering ply was used for making of mould instead of MS sheet, due to its light weight, easy handling, easy demoulding and cost efficiency.

B. Material used for making of Paver blocks:

- **Plastic Waste (LDPE, PP)**

Plastic waste used for making paver blocks was collected from nearby area it includes plastic bags of about 50 microns and empty cement bags.

- **Quarry Dust**

Quarry dust is a crushed sand less than 4.75mm produced from rock using state of crushing plants which was collected from the nearby quarry.

- **Coarse aggregate**

Aggregate passing via 12mm sieve and retained on 10mm sieve as per IS 383-1970 was used.

- **Ceramic waste.**

Principal waste coming from the ceramic enterprise is the ceramic waste.

C. Mix Ratio:

- **Specimen 1:** This specimen was casted by using proportion mentioned below:

(Weight of specimen = 2 Kg)

Plastic Waste = 0.5 Kg Coarse aggregate = 0.5 Kg

Ceramic waste = 0.5 Kg Quarry dust = 0.5 Kg

- **Specimen 2:** This specimen was casted using proportion mentioned below:

(Weight of specimen = 2.320 Kg)

Plastic waste = 1.250 Kg Quarry dust = 500 gm

Ceramic waste = 600 gm

- **Specimen 3:** This specimen was casted using proportion mentioned below:

(Weight of specimen = 2.430 Kg)

Plastic waste = 1.150 Kg Coarse aggregate = 300 gm

Quarry dust = 500 gm

IV. METHODOLOGY

- **Manufacturing of Paver blocks:**
- Materials used for manufacturing of pavers are LDPE, PP, Quarry dust, coarse aggregate and ceramic waste.
- **Specification of mould:**

Table No 1: Mould Specification

Material	Size of Mould	Shape of Mould	Weight of Mould
Shuttering ply	180 x 150 x 50 mm	Dumbel	1.112 Kg

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Fig No 1 : Mould.

- **Procedure of Making Plastic Paver Blocs:**

In this project, from waste plastic paver blocks were casted, following points are to be considered while casting of paver blocks. Casting of paver blocks consist of a manual casting method.

1. **Collection of Plastic:**

The plastic wastes are collection from collected from residential, commercial and constructional areas.

2. **Manual Sorting of Plastic:**

The plastic waste required for the project work was sorted from the other plastic waste manually.

3. **Melting of Plastic:**

The melting of plastic waste done manually and the source of heat was fire.

4. **Casting of Mould:**

After melting of plastic waste it was in a liquid form, which was then poured in a mould. Other materials as mentioned in mix ratio above were added to it. Then proper compaction was done to remove internal pores.

5. **Curing:**

As the casting of mould was done ,mould was kept for curing purpose for 24hrs,so that it gets harden.

6. **Demoulding:**

After curing procedure of demoulding is followed, sides of the shuttering ply mould werw removed for easy demoulding. Casted paver block was removed.

7. **Finishing:**

Finishing work of paver block was done with the help of bladed material by which the surplus material was removed and the desired shape was achieved after the proper finishing.

Fig No 2: Paver Block.

V. RESULTS AND DISCUSSION

The tests were performed to find out the quality and strength of pavers specimens. Following tests were carried out on paver specimens are as follows:

- **WATER ABSORPTION TEST (IS 10545-3: 1995 Part-3):**

The test procedure is as follows:

The paver specimens were fully immersed in water for about 24hrs. After 24hrs the specimens were removed out off the water and allowed to drain off. After that the specimens were cleaned up and the wet weight was taken, weight of every specimen was recorded and represented as (Ww) then the specimens were kept for drying purpose in natural atmosphere. Dry weight of each specimen was recorded, and is formulated by,

Water absorption = $[(W_2 - W_1)] / [W_1] \times 100$

Where,

W_1= weight of dry paver

W_2=weight of wet paver

Table No 2: Water Absorption Test

Specimen No	Area in mm²	Dry weight of specimen (W_1)	Wet Weight of Specimen (W_2)	Water Absorption in %
Specimen 1	180 x 150	2.000	2.015	**0.75%**
Specimen 2	180 x 150	2.320	2.340	**0.86%**

Volume:03/Issue:07/July-2021 Impact Factor- 5.354 www.irjmets.com

Specimen 3	180 x 150	2.430	2.450	**0.82%**

- **COMPRESSION TEST – (IS 15622-2006):**

Compressive strength for plastic paver blocks of size 180x150x50 mm was obtained. The highest load at failure is taken and mean compressive strength was calculated using following equation,

Compression Strength (N/mm^2)= [Ultimate load in N / cross sectional area (mm^2)]

After 7 days of curing compressive strength obtained by block specimens is mentioned below:

Specimen No	C/S area in mm^2	Compressive Load in KN	Compressive Strength in N/mm^2
Specimen 1	180 x 150	245.25	**10.66**
Specimen 2	180 x 150	246.87	**11.51**
Specimen 3	180 x 150	313.92	**13.64**

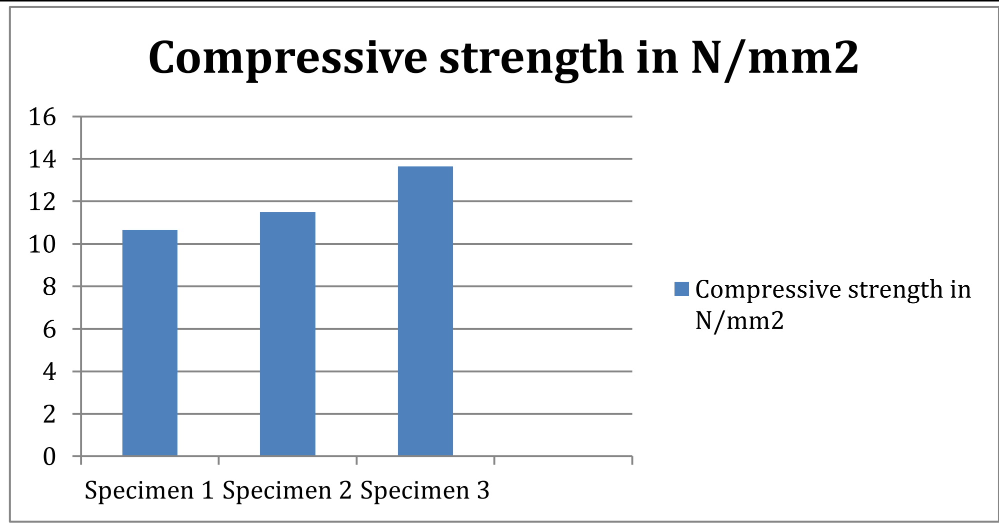

Chart No 1: Chart representing Compressive Strength of Block Specimens.

Fig No 3: CTM Machine.

- **HARDNESS TEST:**

Hardness test is carried out by making a scratch on paver block by any hard material, by which hardness of specimen was observed.

- **OVEN TEST:**

As the paver blocks have been made from plastic, to understand its melting factor through oven test method. The paver blocks have been stored in oven for 2hrs and after their conditions were noted as mentioned below:

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Table No 4: Oven Test Result

Specimen no	Temperature (^{0}C)	Remarks
Specimen 1	50	Remains same
	100	Remains same
	150	**Varies**
Specimen 2	50	Remains same
	100	Remains same
	150	**Varies**
Specimen 3	50	Remains same
	100	Remains same
	150	**Varies**

➢ **RESULT OBTAINED:**

1. Plastic paver blocks made up of waste plastic and ceramic waste gives good result.
2. Water absorption of the plastic paver blocks is **0.81%.**
3. Compressive strength obtained by CTM (compressive testing machine) on specimen is **13.64N/mm^2**
4. In oven test above 150^{0}C changes are identified in blocks due to increase in temperature.

VI. CONCLUSION AND FUTURE SCOPE

The following conclusions had been drawn from the experimental investigation:

- The usage of waste plastic in manufacturing of paver blocks have effective manner of disposal of plastic waste.
- Though the paver is light in weight it gains better compressive strength.
- Paver blocks made by the use of plastic waste, quarry dust, coarse aggregate and ceramic waste have obtained desirable results.
- Good heat resistance is observed.
- It can be utilized in non-traffic roads.
- Using of shuttering ply for making mould is more economical than MS sheet.

➢ **FUTURE SCOPE:**

- After completion of above project it is noted that the paver blocks made from plastic waste and ceramic waste shows good results after curing of 7 days period, but in future it can be done more effective and more strength can be gained by adding some another binding materials like Resin-melamine, resin polysters. All these are chemicals which can be added in future.
- If we used fire proof reagents, colour reagents for making the pavers more good in aesthetic appearance.

Abstract— This project aims to evaluate the potential of reused grey water in concrete and mortar in order to preserve fresh water for drinking purposes. Using both Treated Grey Water and Raw Grey Water (TGW and RGW, respectively) led to a significant increase in the initial setting time and a decrease in the concrete slump value. In addition, there was no effect on mortar soundness properties. The mortar and concrete compressive strength results obtained at 7 days moist curing time showed a significant increase. Mortar and concrete mixes using TGW cast at curing times of 28 days led to no significant effects on compressive strength.

On the contrary, the RGW achieved slightly negative impact on compressive strength at all curing ages. According to the Indian Standards, TGW and RGW are suitable for mortar and concrete production. In conclusion, TGW and RGW are potential alternatives for fresh water in the concrete manufacturing industry.

Index Terms— Drinking Water, Grey Water, Used Water, Sewage Water, Ph meter, BOD, COD, compression testing machine, M25 grade concrete.

I. INTRODUCTION

Water scarcity is the lack of sufficient available water resources to meet the demands of water usage within a region. It already affects every continent and around 2.8 billion people around the world at least one month out of every year. More than 1.2 billion people lack access to clean drinking water.

Economic water scarcity is caused by a lack of investment in infrastructure or technology to draw water from rivers, aquifers or other water sources, or insufficient human capacity to satisfy the demand for water. One quarter of the world's population is affected by economic water scarcity. Symptoms of economic water scarcity include a lack of infrastructure, causing the people without reliable access to water to have to travel long distances in or fetch water, that is often contaminated from rivers for domestic agricultural uses. Large parts of Africa suffer from economic water scarcity; developing water infrastructure in those areas could therefore help to reduce poverty. Critical conditions often arise for economically poor and politically weak communities living in already dry environment.

II. LITERATURE REVIEW

This chapter gives a comprehensive review of the work carried out by various researchers in the field of using plastic in paver blocks.

1. Lynn Schneider has been investigated “Grey water Reuse in Washington State”.(2-6-2009 - 17-9-2009):

This report summarizes the literature on the characterization of grey water by source inside of a home from on potable reuse in the State of Washington for single family homes, multi-family homes, and businesses. It summarizes available data related to the average quantity and constituents of concern associated with a variety of sources of grey water. It is meant to be used as a tool by the grey water rule advisory committee during rule development.This literature review demonstrates that the level of pollution in the total grey water stream that includes kitchen sinks, dishwashers, laundry machines used to wash dirty diapers can be equal to or greater than black water and requires regulations consistent with on-site sewage regulations. Wastewater from kitchens can be

heavily polluted with pathogens, chemicals from dish detergents, and fats, oils and grease. Wastewater from clothes washing machines used for washing soiled diapers contains increased levels of bacteria.

2. Lucy Allen Juliet, Christian-Smith, Meena and Palaniappan has studied “Overview of Grey water Reuse.(Nov18-2010):

The Potential of Grey water Systems to Aid Sustainable Water Management” Grey water, defined slightly differently in different parts of the world, generally refers to the waste water generated from household uses like bathing and washing clothes. This wastewater is distinguished from more heavily contaminated “black water” from toilets. In many utility systems around the world, grey water is combined with black water in a single domestic wastewater stream. Yet grey water can be of far higher quality than black water because of it slow level of contamination and higher potential for reuse. When grey water is reused either on site or nearby, it has the potential to reduce the demand for new water supply, reduce the energy and carbon footprint of water services, and meet a wide range of social and economic needs .In particular, the reuse of grey water can help reduce demand for more costly high-quality potable water.

III. OBJECTIVE

- To study the property of gray water.
- To study the chlorine,ph,cod,bod test on the collected sample of gray water.
- To compare the result of ph chlorination bod cod with normal water.
- To compre compressive test of concrete with variation in percentage of gray water(20% 30% 40%).

IV. MATERIAL USED AND MIX RATIO

A. Material used for making of mould –

Grey Water, Cement, Aggregate, normal water was used for making of block.

B. MIX DESIGN FOR 0.5W/C RATIO

Grade designation	M40
Type of cement	OPC 53 grade
Maximum nominal size of aggregate	20mm
Minimum cement content	300 kg/m3
Maximum water-cement ratio	0.5
Workability	100-120mm slump
Exposure condition	Moderate
Method of concrete placing	Hand placing
Degree of supervision	Good
Type of aggregate	Crushed angular
Maximum cement content	) /m3

STIPULATIONS FOR PROPORTIONING

C. SELECTION OF WATER-CEMENT RATIO

Adopt water-cement ratio as 0.50.

D. SELECTION OF WATER CONTENT

Maximum water content = 186 lt .for 20 mm aggregate

For 25-50mm slump angle=186+(6/186)=197 lt.

E. CALCULATION OF CEMENT CONTENT

Water-cement ratio Cement content =0.50 Cement content =336kg/m3

F. PROPORTION OF VOLUME OF COARSE AGGREGATE AND FINE AGGREGATECONTENT

From , volume of coarse aggregate corresponding to 20 mm size aggregate and fine aggregate (Zone I) for water-cement ratio of 0.50 = 0.60. Therefore, volume of coarse aggregate = 0.60

Volume of fine aggregate content = 1 - 0.60 =0.40

V. METHODOLOGY

- Manufacturing

Collection of sample.

Performing tests on collected water sample:- a) pH b) Chlorination c) BOD d) COD.

Analyzing test Results.

Comparing test results with potable water sample.

Collection of materials

Performing tests on materials collected.

Test to be conducted:-

a) Workability: - 1) Slump cone, 2) Compaction factor test

Casting of concrete cubes using Grey water & potable water.
Performing tests On both cubes
a)Compressive strength Test
Comparison of compressive strength at 7 days and 28 days of curing.

VI. RESULTS AND DISCUSSION

The tests are required to determine the quality and strength of specimen and therefore its suitability for the job.

- GREY WATER TEST

The test procedure is as follows:
Grey water reuse methods can range from low-cost methods such as the manual bucketing of grey water from the outlet of bathroom, to primary treatment methods that coarsely screen oils, greases and solids from the grey water before use via small systems, to more expensive secondary treatment systems that treat and disinfect the grey water to a high standard before using. Figures show some grey water treatments procedure.

PH Testing Machine

Sr. No	Parameter	Result (For GRAY water)	Result (For Normal water)	Units
1	pH	7.5	7.2	-
2	DO	2.4	6.4	Mg\lt
3	BOD	30	5.0	Mg\lt
4	COD	250	Not standard	Mg\lt

For Grey Water and Normal water

- Compression of workability by slump cone test

% of grey water	Slump (mm)
0	40
20	46
40	55
60	60

Comparison of workability by slump cone test

As shown in above graph we can conclude that as the percentage of grey water increases then workability of concrete also increases. . As the percentage of grey water increases by 20%, 40%, 60%, workability increases by 15%, 37.5%, 50% respectively.

Some synthetic detergents, fatty and resinous acids and their salts, alkylbenzeneulfonates are materials of air entraining admixtures and also of soaps and detergents. Therefore soapy water can improve workability.

Chart representing Comparison of compressive strength at 28 days of curing:

% of Grey water	Casting Date	Test Date	Weight (Kg)	Strength (MPa)	Mean Strength (MPa)	Peak Load (KN)
0%	27/02/21	26/03/21	9.319	40.01	40.63	900.225
			9.579	42.30		950.75
			9.230	39.60		823.5
20%	13/03/21	10/04/21	8.447	37.64	37.38	846.9
			8.485	38.10		857.25
			8.397	36.40		819
40%	14/03/21	12/04/21	8.377	36.30	35.53	816.75
			8.311	35.40		796.5
			8.401	34.90		785.25
60%	16/03/21	16/04/21	9.307	32.95	32.56	741.375
			8.107	30.30		681.75
			9.203	31.45		707.625

Results of compressive strength at 28 days of curing

Graph of Comparison of compressive strength at 28 days of curing

CTM Machine

RESULTS OBTAINED

As shown in above graph we can conclude that as the percentage of grey water increases then compressive strength of concrete at 28 days curing goes on decreases.

When the grey water is increased by 20% , 40%, 60% then compressive strength of concrete at 28 days curing decreases by 1.1%, 6.9%, 19.40%.

CONCLUSION AND FUTURE SCOPE

- Increase in Workability: Air entraining admixtures can improve workability of concrete. Some synthetic detergents, fatty and resinous acids and their salts are materials of air entraining admixtures and of soaps and detergents both. Therefore, soapy water can improve workability. At the same time these materials are helpful for improving durability in freeze-thaw, deicer, sulphate and alkali-reactive environments.
- As we had taken the chlorinization test,PH, cod, bod test as the percentage of the gray water increases by 20% 40% 60% percent workability
- Compression stress at 28 days of curing goes on decreasing when the gray water is increased yb 20% 40% 60%
- As the conclusion we cat use the gray water more than 60% in a concrete as the strength of the concrete is decreaseing in high level.

FUTURE SCOPE

- 1 As a result of reuse, fresh water drinking supplies are conserved enabling it to remain in natural ecosystems.
- Grey water has the potential to save on average 50 per cent of an average household's water use. Apart from savings to the consumer, grey water reuse saves water authority money, reduces sewage flows and reduces the demand on potable water supplies.
- load on wastewater disposal systems is reduced and therefore their life is prolonged and capital expenditure required for upgrading and expansion is delayed, if not potentially decreased.

Abstract
This report presents the utilization of EpaNET software within the design of the water distribution network for the village Saigaon, Satara district. the most important purpose of providing a decent distribution network is to produce sufficient pressure at each node point with less loss. A water distribution network consists of pipes, valves, tanks, etc. EpaNET could be a bug that tracks the flow of water in each pipe, the pressure at each node, and therefore the height of water in ESR. this report was accustomed do the look and hydraulic analysis of the water distribution network using EpaNET software. the tactic of distribution used here is that the combined gravity and pumping system. it absolutely was obtained that the pressure in the slightest degree junctions and flow with their velocities in the least pipes are feasible. The analysis is disbursed supported various public demands, quantities of inflows, and outflows of the overhead reservoirs. This analysis provides information about various demands, losses, and uses of the general public. the planning of a replacement network of supply will make attentive to the new demands, rate of increase within the demands. the look is formed thanks to the growth rate, and also the developing village. The report presents the hydraulic analysis of the pipeline network of Saigaon village using EPANET 2.0. for a region of 1.2 sq Km area and 1210 Population 2050. The water from the source well is taken via the network of pipes to the ESR Elevated Storage Reservoirs during the availability hours and water is supply to the world by gravity. the gap between the source well to ESR is 839 m. Simulation has been dispensed for hydraulic parameters like head pressure and flow.
Keywords: *distribution network, Epanet software, ESR tank, simulation.*

Date of Submission: 16-07-2021 Date of acceptance: 01-08-2021

I. INTRODUCTION

Water is that the most significant need of all living organisms. Water is employed for irrigation purposes, industrial purposes, and domestic purposes. a water distribution network should be designed in such the simplest way that it meets the demand of the increased population. An adequate installation can give better living standards. The water quality shouldn't get deteriorated within the distribution pipe. a decent water distribution network provides sufficient pressure at each point of distribution with less loss. a decent water distribution network satisfies the buyer demand at the desired time. the planning and analysis of water distribution networks may be a complex process. Water supply systems get water from a range of locations, including groundwater, surface water. The water is then, in most cases purified, disinfected through chlorination, and sometimes fluoridated. Treated water either flows by gravity or is pumped to a reservoir, which might be elevated like a reservoir or on the bottom. The water is then fed into the distribution. Water distribution system, hydraulic infrastructure contains elements like pipeline, tanks, basin, pumps, and valve, etc. is important to produce water to the consumer's elements of a distribution system include distribution mains, arterial mains, storage basin and system elements (valves, hydrants, mainline meters, service connections, and backflow preventers). Distribution main are the pipes that compose the distribution complex. Their purpose is to transmit water from water sources or treatment work to users. Service connection that connects either other plumbing systems or a private building to distribution system mains. The water distribution system consists of an interconnected series of pipelines storage facilities and elements that convey waters that are used for drinking and also meeting the hearth protection needs for cities, schools, homes, hospitals, industries, businesses, and other facilities.

II. LITERATURE REVIEW

Jagtap R. et all [1], This study is based on assessment of existing water distribution network using EPANET 2.0 software. The pipe network and junction network system is simulated to understand its behavior for different inputs using EPANET 2.0. Simulation has been carried out for hydraulic parameters such as head, pressure and flow rate. The results obtained verify that the pressures at all junctions and the flows with their velocities at all pipes are feasible enough to provide adequate water by the network of the study area.

G. ANISHA et all [2], This research is all about the analysis of the existing network and concludes about the reliability on the network for the future. The analysis is carried out based on various public demands, quantities of inflows and out flows of the over-head reservoirs. This analysis provides the information about various demands, losses, and uses of the public. The design of a new network of supply will make the municipality be aware of the new demands, rate of increase in the demands. The design is made keeping in view of the population growth rate, and the developing town. The design brings out an improvement in the existing network.

Dr. G. Venkata Ramana et all [3], This paper highlights only the effective design and distribution of network of pipes using EPANET tool. The residual head at each and every node was found out by having the elevation as input and thereby the corresponding flow quantities were derived like residual head, velocity and nodal demand etc.

III. OBJECTIVE

1) To design a water distribution network that can supply an adequate quantity of water to the consumer's end with sufficient pressure and 24*7 supply.

IV. METHODOLOGY

- Study area.
- Population forecasting.
- ESR capacity calculation.
- Analysis of distribution network with Epanet software.

4.1 Study Area.

Saigaon Gram panchayat is located in Koregoan tehsil of Satara district. Saigaon gram panchayat has an area of 1.3 sq. Km. Saigaon is located at a distance of 17 km to the southeast of Satara and 14 km south of Koregaon. The study area covers 7 zones of Saigaon village and some eastern parts of Dhamner village attached to Saigaon village. The current population of the study area is 840.

Table 4.1.1 Study Area Basic Information

The current population of study area	840
Total no of households in study area	150
No of shops in area	08
No of primary schools in area	01

4.2. Population Forecasting

Methods of population forecasting.

a. Arithmetical increase method.
b. Geometrical increase method.
c. Incremental increase method.

As Saigaon is a small village but the migration rate of population from Karnataka as daily wedge labor is more here. These migrated people work on construction sites or in MIDC AREA near Satara. So here we adopting a method for population forecasting is the "**Incremental Increase Method**".

The design period for proposed water distribution supply scheme is 30 years. so population forecasting have to be done for the year 2050.

2030	959
2040	1082
2050	1210

4.3 ESR capacity calculation.

Water supply or distribution reservoirs are hydraulically an integral part of the water distribution system, and the proportion of water supply pipes leading to them is usually so high that they can supply water at a rate high enough to meet with the maximum 24 hours a day. Hourly demand that exceeds this ratio is supplied by storage.

Table 4.3.1 Total Daily Demand

Forecasted Population	Supply	Total Requirement
1210	70	84700 LTRS

Satara

Table 4.3.4 Design ESR Capacity

ESR min required	52231.6 ltrs
Reserve for breakdown (30 LPCD)	37769 ltrs
Firefighting reserve	10000 ltrs

So design ESR capacity is 100000 ltrs (1 lakh liters)

4.4 Distribution Network Analysis with Epanet 2.0

We are designing distribution network for next 30 years for the village Saigaon. We are going to use here HDPE pipe which has coefficient of roughness 150 and durability up to 50 years.

❖ **Distribution network design**

1. Gravity based distribution supply of water.
2. Dead end pipe network.
3. 27 x 7 supply

EpaNET 2.0

For the analysis of distribution network, we are going to use EpaNET 2.0 software. EpaNET is a computer program that performs extended period simulation of hydraulic and water quality behaviour within pressurized pipes.

V. RESULTS AND DISCUSSION

The water distribution network has been designed and analyzed successfully using the EpaNET software. At the end of the analysis it was found that the resulting pressure at all junctions and the flows with their velocities at all pipes are adequate enough provide water to the proposed area.

In the analysis its found that residual pressure is greater than 15 m at each node. And IS 1172 recommends minimum residual pressure of 7m, so end user will get water with sufficient pressure.

Assumed internal diameter of 90 mm is sufficient to withstand for the pressure for the entire network.

***Abstract*: A study was done to determine about sand filter these filters are commonly used in conventional water treatment plants. Problems like mud ball formation and unsatisfactory effluents are affecting sand filter beds. It has been found out that dual media and multimedia filters can overcome the limitations of sand filter. Capping materials such as crushed coconut shell and coal is used as a dual media. Design dual media filters capped with crushed coconut shell proves to be more efficient, economical and durable. Three models having capacity of 10 liter are practiced. All these models consist layers of gravel, sand and capping material of thickness 7cm each. Crushed coconut shell and coal are used as capping material in different models respectively. The water sample was collected from nearby river. The tests which are conducted on sample are pH, Temperature, Total Dissolved Solids, Alkalinity, and Turbidity. The efficiency is based on test results.**

***Keywords*: Sand filter, Coconut shell, Coal, Turbidity, pH, TDS.**

1. Introduction

Water is a basic need of human being; hence the provisions of clean water is an important issue to solve [1].

From hundreds of years there is a technology called slow sand filtration which is used for purpose of the drinking water. This process is well-suited for small, rural areas since it does not need a high degree of operator skill. As its name implies, slow sand filtration is used to filter water at very slow rates. The typical filtration rate is at least fifty times slower than for rapid rate filtration [7]. Due to slower rates of filtrate water, a large area is required for the filtration. Chemicals are not needed for proper filtration operation. Removal of particles is completed primarily through biological processes that provide treatment. The biological activity is located primarily in the top surface of the filter known as the Schmutz decked, although recent research has stated that biological processes throughout the depth of the filter bed may also influence particle removal. A ripening period from several weeks to several months is necessary [7]. So that the biological organisms mature in a new slow sand filter. Purification is always a need from the ancient times [7]. Risk of pollutants should be reduced from. So, the government are taking many efforts to provide adequate and safe drinking water to society by constructing water treatment plants in India. In India sand filter are mostly used to remove the suspended and colloidal particles from water in filtration process for the faster rate. Capping of existing sand filter is the promising method of improving the performance of sand filter [1]. Water purification or drinking water treatment, is the process of removing contaminants from surface water to make it safe and potable for human consumption. We all know that access to clean, fresh water is fundamental to our health and well-being. Most water filters remove harmful Chemicals and bacteria which if consumed can cause diseases.

2. Literature Review

Teena Ann Thomas and K. Mophin Kani. Slow sand filtration is a technology that has been used for potable water filtration for hundreds of years. It is a process well-suited for small, rural communities since it does not require a high degree of operator skill. As its name is, SSF is used to filter water. This water filtrates at very slow rate. It is observed that the typical filtration rate is at least fifty times slower. Due to this slow rate of filtration, a large land area is required for the filtration basins. There is no need of chemical required for proper filtration operation. Removal of particles is completed primarily through biological processes. These also provide treatment. The biological activity is located primarily in the top surface of the filter known as the “schmutzdecke,” Recent studies has stated these biological processes throughout the depth of the filter bed may also influence removal of particle. A “ripening” period from several weeks to several months is necessary for the biological organisms to mature in a new slow sand filter.

Mah, PFRA Canada-Saskatchewan Agri-Food Innovation Fund (AFIF). June 2001. Slow sand filtration has been used successfully in Europe since the early 1900s, and is still a popular method of treating municipal water supplies. Research, and other observations, show that slow sand filtration can effectively remove cysts and coli form bacteria from raw water, and is an innovative, cost effective, low maintenance treatment process. This system works best as part of a multi-barrier treatment approach. A slow sand filter is comprised of a bed of graded sand which is supported by a layer of gravel. This filter media is confined in a box with openings at both ends m allowing water to flow in and out, while operating on a top-

DIRECTOR
Yashoda Technical Campus
Satara

down, gravity basis. The filtration process a form of natural, biological water treatment is used to remove solids, precipitates, turbidity (muddiness) and in some cases bacterial particles that produce bad taste and odour. Slow sand filtration is well-suited to treat farm water supplies that have reasonable raw water quality.

Sudhir Kapgate, Amol G. Gore, Gaurao S. Kale, Sagar I. Wanjar, Kunal P. Wanode, Rushikesh B. Balpande. Rainwater is an important source to feed the groundwater aquifer, which is done directly or by harvesting and recharging. Purification is always a need from the ancient age of civilization. So the central and state government are taking effort to provide adequate and safe drinking water to society by constructing water treatment plants in India. In India sand filter are mostly used to remove the suspended and colloidal particles from water in filtration process for the faster rate by setting out the different sand beds in constructing it. Designing 'Dual media filter capped with crushed coconut shells' proves to be more efficient, economical and durable.

Abdol Majid Fadaei Department of Environmental Health Engineering, School of Health, Shahrekord University of Medical Sciences, Shahrekord, Iran. Access to safe drinking water has been an important national goal in rural area and other areas. Slow sand filtration (SSF) is one of the oldest water treatment processes used to produce microbiologically safe drinking water. It is shown that safe drinking water was achieved by a combination of a protected and high quality source at the initial point and maintaining quality from the initial supply (source) point through to final consumption. Our study showed efficiency of physical and biological treatment of slow sand filter was relatively desirable but, for water quality improvement it is suggested that a chemistry and microbiology lab in treatment plant be set up. Also filter washing and cleaning should be accomplished on time.

3. Objective of the Project

If you have a Table, simply paste it in the box provided below and adjust the table or the box. If you adjust the box, you can keep the tabl Based on the literature survey the following aims and objectives were decided.

- To construct, design and test the model of slow sand filter capped with coconut shell and slow sand filter capped with coal.
- To compare the performance of slow sand filter capped with coconut shell and slow sand filter capped with coal on the basis of quality of effluent produced which is measured in terms of parameters such as pH, total dissolved solids, alkalinity, hardness, chlorides and turbidity.
- To study and design a sand filter for the removal of pathogen and suspended solids from water using coconut shells, anthracite coal, river sand and gravel for rural area.
- To improve water quality and reduce the cost of providing the clean water and improve ecosystem by maintaining water quality to acceptable levels.
- Improving water system efficiency and resource conservation.

4. Materials and Methodology

In this Paper testing facility, experimental procedures and experimental programs are included. Design of experimental setup is done based on the basic design of sand filter.

A. *Material Specification*

The materials used for filters are gravel, sand, coconut shell and coal.

Table 1
Materials and specifications

S. No.	Material	Particle Size
1.	River Sand	0.35-0.60mm
2.	Coal	2-3cm
3.	Gravels	4-5cm

1) *Gravel*

Gravel which retained on 4.75mm has been used as supporting media for sand layer [3]. The depth of gravel layer in the filtration units is 20cm. Gravel was washed and ovendried thoroughly before using as the supporting filter media layer [3].

2) *Sand*

River sand having uniformity co-efficient 1.7 and effective size 0.60mm is used as filter material [3]. Sand was washed with clean, sun dried and oven dried before using as filter media. The depth of sand layer maintained in the filtration unit is 7cm.

3) *Coal*

The burned wooden coal is used as capping material above sand layer. The depth of coal layer maintained in the filtration unit is 7cm. The coal is washed and the blackness of the coal is removed and then placed in filter. The strong quality of coal is to decolorize and remove taste from water. With an abundance of larger pores, it attracts certain dissolved chemicals and removes larger particulates. Wastewater treatment plants use it to filter water, while the food industry often uses it to decolorize juices, liquors and other products. Coal is a natural and non-toxic material. The charcoal not only removes impurities it also adds some important minerals such as calcium, magnesium and iron to improve the water quality.

B. *Design of Model*

We will prepare three models of filters which will have cylindrical shape. The first model will have gravel as a base material, sand as filter media above it and capping of coconut shell at the top. The second model will also contain gravel as a base material but the coal will be used as a capping material between gravel and sand. The third model will again contain gravel as a base material and coal and coconut will be used as a capping material between gravel and sand. All three models will have storage of same capacity and an outlet. So basically, all three models will contain layers of gravel, sand, coconut shells and coal and has drainage attached between top part and bottom i.e. storage. The capacity of the filter is 40 liter in which top part has 30-liter capacity and the storage has 10-liter capacity overall diameter of the filter is 27cm.The fig. 2.B.1

experimental setup of slow sand filter with coconut capping and coal.

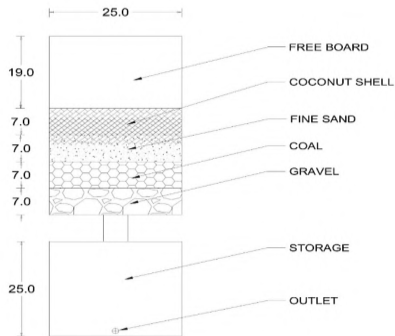

Fig. 1. B.1 schematic model

C. Methodology

In this section, testing facilities, experimental procedures and experimental programs are included. Design of experimental set up is done based on the basic design of slow sand filtration. As per the literature review the design for set-up is done. The following procedure was adopted for conducting the test:

1. Filter layer consisting of gravel bed of 7 cm thickness, sand layer of 7cm thickness and coconut shell layer of 7cm thickness was spread in the filter unit.
2. The water obtained from the lake was stored in a large container for a detention period of about 3-4 hours.
3. Influent water is fed into the filter with the help of a collector of 10 liters capacity has been placed well above the filter unit.
4. A head of water above the filter media in the filtration unit of 19cm was maintained throughout the test period. The raw water was fed to filtration unit continuously through dispenser placed above the filtration unit.
5. Influent and effluent samples were taken at a frequency of every 2 hours. These samples are tested for pH and turbidity. The experiment has been carried out up to 24 hours.

5. Experimental Work

Following test are conducted on water sample**:**

- Temperature Test
- pH Test
- Turbidity Test
- Total Dissolved Solids
- Hardness Test

6. Results

Table 2

Tests result of outlet of SSF capped with coal and coconut shell.

Parameters	Hardness	Ph	TDS	Turbidity	Temp 0^C
1	44.8	7	104.5	3.30	16
2	43.7	7.1	103.9	2.91	16
3	44.2	7.3	104	3.26	17
4	45.1	7.35	105.8	3.45	18
5	44.9	7.46	104.7	2.99	15
6	46.2	7.5	106	3.01	17
7	45	7.56	105.2	3.42	16

7. Conclusion

The following conclusions can be drawn from the project study on different aspects of slow sand filtration.

- Slow sand filters capped with coal having better removal efficiency of Hardness, Total dissolved solids comparing with slow sand filter capped with coconut shell.
- Turbidity and colour removal efficiency decline considerably with higher filtration rates, although the filtrate quality remains reasonably good.
- With less flow rate and the periodic replacement of filter media are the major limitations of the slow sand filters.
- Slow sand filters capped with coconut shell and coal together have shown effective removal of turbidity, Total dissolved solids comparing with slow sand filter capped with coconut shell and slow sand filter capped with coal.

Utilization of Press mud for Improvement of Strength of Interlocking Bricks

Mr. Shaikh. A. N.[1], Miss.Deshmukh P.S.[2], Mr. Shelar V.E.[3]

[1,2,3] Asst. Professor, Department of Civil Engineering, Dnyanshree Institute of Engineering and Technology,Sajjangad Satara, Maharashtra, India.

Abstract -Bricks are considered to be the most widely used and useful material of construction all over the world. In recent years, Interlocking brick has made significant advances which have resulted in economical improvements in strength of clay bricks. The economic development of nation depends upon the intelligent use of locally available materials. To overcome the use of natural resources and by attempting to use waste materials like waste Press-Mud and waste Fly ash in bricks could result in low cost construction. Waste Press mud is the byproduct of sugarcane factory which causes environmental problems because of its high production and less use. Sugar industries produce the huge amount of press mud and other waste materials. The production of press mud is significantly increased, due to increasing of the production of sugar and increasing the generation of new sugar factories also the use of waste press mud in manufacturing of interlocking bricks could help to avoid the problems related to environment pollution. An attempt has been made in this study to determine the maximum compressive strength of interlocking brick by using press mud consisting of sugarcane waste as partial replacement for fine aggregates (Grit). By using press mud, we can reduce the self-weight of brick. Interlocking bricks are used for easy construction of mortar less masonry and better appearance.

Key Words: Sugarcane Waste, Press Mud, Interlocking Brick, Mortar, Fly Ash, Grit.

1. INTRODUCTION

There is a strong demand for environmentally safe reuse and effective disposal method sugarcane press mud due to the increasing amount of sludge generated by various industries and plants in India. Landfills are commonly used for disposal of sludge in India, rapid urbanization has made it increasingly difficult to find suitable landfill sites. Therefore, incineration has become one of the few alternatives available for disposal of sugarcane press mud. The ultimate disposal of incinerated press mud can be accomplished by using it as engineering construction material. One possible solution for the management of this sugarcane press mud is to re-use it as a building material, namely, to incorporate this sugarcane waste press mud into interlocking bricks. The cement interlocking brick is a one of the most useful masonry building materials. The recycling of waste materials by incorporating them into interlocking bricks has been a popular topic of investigation over the last century, with varying degrees of success across a wide range of waste material of sugarcane press mud. This popularity is likely due to flexibility on the type of wastes which can be mixed into the brick making material, but more importantly, the high temperature involved in firing the bricks allows for the volatilization of dangerous Component, as well as the fixation of wastes into the vitreous phase of the brick. The current study investigates the potential for reusing sugarcane press mud by using it as a partial replacement of material [1].

1.1 What is Sugarcane Press Mud?

India is the second largest producer of the sugar in the world, with an annual output of 25 million tonnes. Among the steps leading to the production of refined sugar is the separation of sugarcane juice from the associated particulates. Upon this separation a solid residue is obtained which is called the press mud. In a typical sugar factory, the processing of 100 tonnes of sugarcane produces about 3 tonnes of press mud. In Maharashtra some sugar factory's 8–10 million tonnes of press mud are generated annually [2].

1.2 COMPOSITION OF PRESS MUD:

Press mud from the sugar industries is a very useful source of fertilizer as well as some substances. The major use that has recently been developed in India is in bio composting (usually trade named as Bio earth) where it is treated with the spent wash from the distillery. The composition of press mud is given in Table-1. Its usefulness as fertilizer is based on the nutrient content of the press mud and the spent wash as shown below: [2].

Table -1: Composition of press mud.

Sr. No.	Composition	(%)
1	Crude wax	5-14
2	Fiber	15-30
3	Crude protein	5-15
4	SiO	4-10
5	CaO	1-4
6	PO	1-3
7	MgO	0.5-1.5
8	Total ash	9-10

Table -2: Nutrientcontentsof press mud.

Composition	Press mud	Spent wash (mg/l)
Nitrogen	1.15 – 3.0	2630
Phosphorus	0.60 – 3.50	201
Potassium	0.30 – 1.80	222

1.3 GENERATION OF PRESS MUD:

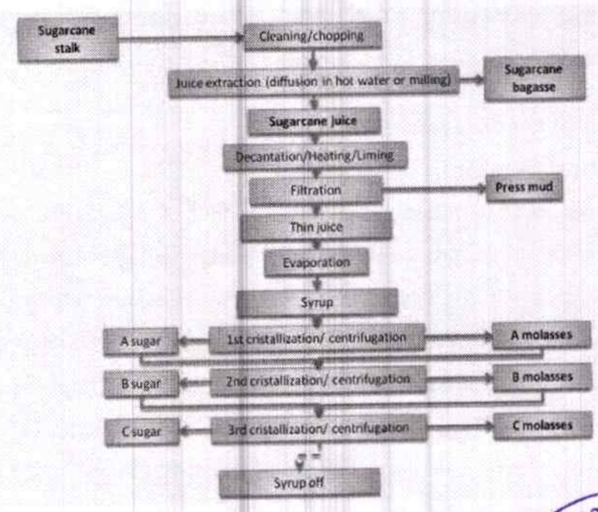

Fig -1: Generation of press mud.

2. LITERATURE REVIEW:

The waste from the industries is very harmful for the environment and also to our health, if not disposed in proper manner. The solid residue of sugarcane after crushing, extraction of its juice and before crystallization of s ugar.is known as “press mud”. India is one of the largest agriculture residues in the world [2]. The one way to dispose this waste is its use as fertilizer. But this is suitable for particular crops only. So, farmers avoid using it. The use of Sugarcane waste in brick can save the sugarcane industry disposal costs and produce an ecofriendly brick for construction. Sugarcane crop cultivation in India forms an important part of the Indian agricultural economy. The press mud can be used to recover protein, sugar and wax from press mud.

3. METHODOLOGY:

For the analysis purpose various interlocking brick samples are casted as per mix design with different percentage of sugarcane press mud and. the whole analysis is done in eight step which is given below.

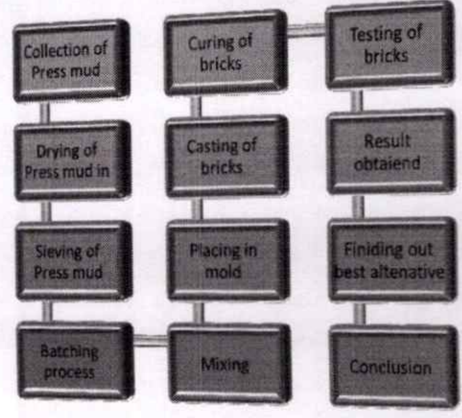

Chart -1: Process chart

3.1 COLLECTION OF PRESS MUD FROM FACTORY SITE:

3.2 DRYING OF PRESS MUD IN SUN:

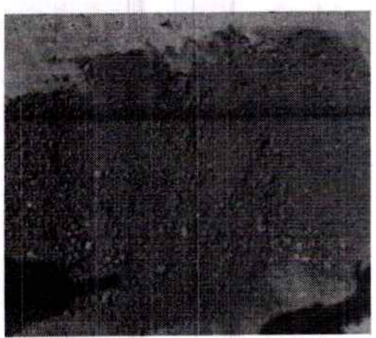

Fig -3: Drying of press mud

3.3 CASTING OF BRICKS:

Fig -4: Casting of bricks

3.4 CURING OF BRICKS:

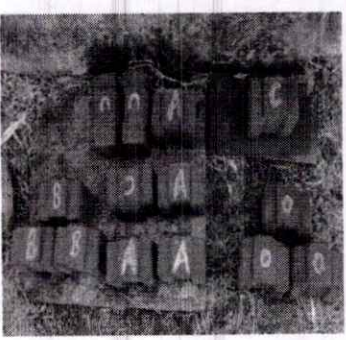

Fig -5: Placed for Curing

4. TEST ON BRICKS:

4.1. SHAPE AND SIZE TEST:

In this test, a brick specimen is closely inspected. It should be of standard size and its shape should be correctly rectangular with sharp edges. For this test, 3 bricks are selected at random and they are stacked length wise, along the width and along the height.

Results observed are:

1. One brick has not proper sharp edge.
2. Shape of brick slightly change due to breaking of edges.

4.2 WATER ABSORPTION TEST:

A brick is taken and it is weighted when it is dry. It is then immersed in water for a period of 24 hours. The brick is weighed again. The difference in weight indicates the amount of water absorbed by the brick. It should not exceed 20 percent of weight of dry brick.

Table -3: Water Absorption Test Result

Sr. No.	Block Name	Water absorption (%)
1	O	17.50 %
2	A	20.50 %
3	B	22.83 %
4	C	26.00 %

4.2 COMPRESSIVE STRENGTH TEST:

In this test the brick specimens are immersed in water for 24 hours. The specimen O, A, B, C is placed in compression testing machine. Then the load is applied axially at a uniform rate of 10 N/mm^2.The load and strength are noted accordingly.

Table -4: Compressive Strength Test Result

Sr. No.	Block Name	Compressive strength N/mm^2
1	O	3.54
2	A	4.16
3	B	3.75
4	C	2.93

Chart No.2: Comparison of Compressive Strength Result N/mm^2 (28 Days)

5. CONCLUSIONS

Based on the above experimental procedure and test, we conclude as:

1. Use of sugarcane press mud in brick has solved the disposal problem; reduced cost and produced Eco- friendly brick for construction.
2. Reduction of weight of interlocking brick up to 20 % of weight of brick. As compere to normal interlocking bricks the bricks are light weight bricks.
3. In the Compressive strength result observed that block A is Shows moderately effect in increasing strength as compared to conventional brick i.e. greater than 3.5 N/mm^2.

Abstract: AISI H13 die steel specimens were subjected to heating at 1020 °C followed by oil quenching and double tempering at 520 °C. Subsequently, these specimens were subjected to deep cryogenic treatment at −185 °C in liquid nitrogen environment for 16 h and then subjected to soft tempering at 100 °C once the specimens attained room temperature. Thereafter, the specimens were subjected to scanning electron microscopy (SEM) analysis and electron backscatter diffraction (EBSD) analysis. The electrochemical corrosion activity was investigated in 3.5% NaCl at 23 ± 0.5 °C by evaluating the evolution of open circuit potential over time and potentiodynamic curves, and electrochemical impedance spectroscopy study was also carried out. The heat-treated specimens exhibited better resistance to corrosion through more electropositive values of open circuit potential. This could be attributed to lower grain boundary area in heat-treated specimens as compared to 16 h cryogenically treated specimen as higher grain boundary areas behave as an anode in an electrochemical cell, thereby enhancing the rate of corrosion. According to electrochemical tests, the cryogenically treated surface is more resistant to corrosion, followed by heated alloy. However, both surface modification treatments improved the corrosion behavior of the untreated alloy.

1. Introduction

The tool steels are widely used in hot working industries including forging and extrusion. According to the market study and analysis, the global market size of the tool steels was USD 4.29 billion in 2020, and as per the forecast, their value is expected to cross over USD 6395.95 by 2025 [1,2]. AISI H13 hot work die steel is one of the most important materials belonging to this category. In some of the applications, AISI H13 undergoes a phase change, austenitizing some region of the component when it is under stress and heat due to friction which could promote the spalling [3]; other reasons for failure could be oxidative or abrasive wear, fatigue cracking and chipping as experienced in some of the cases [4]. The corrosion damage of H13 die steel has also been reported in the case of applications involving the manufacturing of dies for aluminum cans [5]. Since these materials are subjected to heat and mechanical stresses, their corrosion behavior needs to be studied in order to investigate their response towards changing conditions, as well as to report any possible degradation in their properties during service.

6757 SATARA DIRECTOR Yashoda Technical Campus Satara

The tool steels need to possess certain characteristics in order to withstand highly challenging conditions during mechanical working operations [6]. These characteristics include hardness, resistance to wear and fatigue properties. Even though the basic combinations present in tool steels do add up these characteristics, the need of the time is to further improve them. The deep cryogenic treatment has been recommended as an add-on process to improve certain mechanical properties, especially wear resistance, as indicated by many researchers in their studies on tool steels [7–17]. This treatment increases the density of precipitation of most of the carbides in tool steels and reduces average carbide particle size [18]. Some researchers have elaborated that the deep cryogenic treatment improves the surface finish of the materials through the refinement of martensite laths [19]. This method had been beneficial for materials such as AISI H13 die steel [20–23] in order to improve the wear resistance, hardness and surface characteristics, thereby enhancing the performance of the material.

The fine carbides precipitated after cryogenic treatment assist with the improvement of these properties substantially. The cryogenic treatment even had an impact on fatigue life, as reported by some researchers [24,25]. The fine carbides could act as microcrack arresters. They delay the propagation of these microcracks, thereby enhancing the fatigue life, which is quite beneficial for applications such as mechanical working. It has also been elaborated that the deep cryogenic treatment improved the corrosion resistance for some tool steels such as 1.2080 [26]. Corrosion behavior of hot work tool steels has been studied, and it was reported by researchers that methods such as pressure vapor deposition (PVD) and nitriding could be helpful in improving the corrosion resistance of these materials [27–29]. PVD coatings assist in localizing the attack on the material surface. A good adhesiveness is essential in retaining the coating layer and thereby preventing any further attack of the chemical or any surrounding agent which could result in formation of any corrosive byproduct.

One researcher experimented with the formation of a borided layer on the surface of AISI H13 steel [30]. The borided layers formed single phase or dual phase structures and their layers were compact and crack-free, which improved the corrosion resistance of the steel, especially in the case of steam turbine applications. The deep cryogenic treatment has been beneficial in improving the corrosion characteristics of structural steels. It could certainly become a potential method for those applications where corrosion plays a very important role deciding the lifespan of the component [31]. Most of the treatments have focused upon surface modifications in order to improve the corrosion resistance of tool steels.

In the last few decades, there was an interest in increasing the wear resistance of steels by applying deep cryogenic treatment due to homogenization and stabilization of internal microstructure. The modification of other steels such as D-2, M-2 and AISI H13 by deep cryogenic treatment can be found in the literature. The aim of the paper is to investigate the corrosion resistance of the AISI H13 die steel specimens by the deep cryogenic treatment at −185 °C in liquid nitrogen environment for 16 h and to see the effect of this treatment on its properties. Electron backscatter diffraction (EBSD) analysis, grain mapping tools and Nyquist plots have been used in the current research work in order to evaluate the performance of AISI H13 die steel specimens when subjected to a corrosive atmosphere.

The study also investigates the outcomes based on the experimentation to comment upon the best treatment for H13 steel in order to withstand the corrosive atmosphere. The results have been compared to those of the untreated and conventionally heat-treated specimens.

2. Materials and Methods

2.1. Surface Modification Process

AISI H13 material was procured from Rajasthan Steels, Pune (India), to fabricate the specimens for research work. The chemical composition involves C—0.39%, Mn—0.30%, Si—0.40%, Cr—5.40%, Mo—1.4%, V—1.00%, balance Fe, by weight. A set of AISI H13

DIRECTOR
Yashoda Technical Campus
Satara

specimens (diameter 8 mm and length 15 mm) was hardened at 1020 °C with a step-by-step heating (first heating to 500 °C at a rate of 7 °C/min and holding for 20 min and thereafter heating to 860 °C and soaking for 20 min) to prevent cracking due to thermal stresses. These specimens were soaked for 20 min at 1020 °C followed by oil quenching. The quenched specimens were double tempered at 520 °C for 2 h. This treatment was named conventional heat treatment for AISI H13 steel and the specimens were designated as "heated" specimens. In a cryo-chamber (Sanmar, Mumbai, India) supplied with liquid nitrogen at a cooling rate of 3 °C/min, the other set of specimens was subjected to conventional heat treatment (step-by-step heating to 1020 °C, oil quenching and double tempering at 520 °C for 2 h) and cryogenic treatment at −185 °C at a cryo soaking period of 16 h [21]. At the end of 16 h of cryo soaking period, these specimens were transferred to an insulated box (Cryobox, Sigma-Aldrich, Irvine, UK) until they attained room temperature, and thereafter the specimens were soft-tempered for 1 h at 100 °C to eliminate the cold stresses produced during the cryogenic treatment. Specimens cryogenically treated for 16 h were referred to as "cryo" specimens.

2.2. Characterization Methods of Developed Surfaces

All specimens were examined by scanning electron microscopy (SEM) (Tabletop Microscope TM3030, Hitachi, Tokyo, Japan) after mechanical polishing which involved grinding down using SiC papers (homemade), sequentially from 320 to 4000 grits. Subsequently, the ground specimens were active oxide polishing (OPS) polished for 30 min using a suspension diluted with H_2O with a ratio of 1:5 to a mirror finish.

The specimens were further characterized for grain orientation and texture direction using a Hitachi 3400 SEM-based Bruker e-flash electron backscatter diffraction (EBSD) detector (Cheshire, UK) at 20 kV acceleration voltage, 10 mA current density and 1 mm step size. The images were postprocessed using MTEX software (free Matlab toolbox, see details in https://mtex-toolbox.github.io/, accessed on 3 December 2021).

The electrochemical behavior was measured using a VERSASTAT potentiostat/galvanostat (Princeton Applied Research, Princeton, NJ, USA). The tests were performed in 3.5% NaCl solution (pH = 7.4) at 23 ± 0.5 °C. Each sample was placed in a Teflon sample holder (Princeton Applied Research, Princeton, USA) with exactly 1 cm^2 exposed to the corrosive media. A platinum electrode (XM140, Radiometer Analytical, Loveland, CO, USA) was used as the counter electrode and saturated calomel (XR110, Radiometer Analytical, Loveland, CO, USA) was used as the reference electrode. All measurements were achieved at a scanning rate of 1 mV/s. The open circuit potential (E_{OC}) was monitored for 1 h, starting right after the immersion of the sample in the 3.5% NaCl solution, and the potentiodynamic curves were recorded at −1 to +2 V vs. E_{OC}. The tests were performed according to the standard ISO 16151:2018. Electrochemical behavior of the investigated specimens was also examined by electrochemical impedance spectroscopy (EIS). Impedance measurements were performed at open circuit potential with constant perturbing AC signal amplitude of 10 mV over a frequency range extending from 0.1 to 10^4 Hz. Analysis of the spectra was performed by equivalent circuit fitting using Zview software (Princeton Applied Research, Princeton, USA). After the corrosion tests, each surface was analysed by SEM and profilometry (Dektak 150, Bruker, Billerica, MA, USA) in order to evaluate the morphology and roughness.

3. Results

3.1. Microstructural Results

The microstructural details of polycrystalline materials can be investigated with the help of electron backscatter diffraction (EBSD) analysis [32]. One of the reasons why grain boundaries must be analyzed is that the performance and integrity of the material depend upon the grain boundary networks present inside the materials [33]. The EBSD feature has made it possible to analyze more than 10^4 boundaries in order to investigate their role in properties such as corrosion resistance [34,35]. The grain size has a significant

DIRECTOR
Yashoda Technical Campus
Satara

impact on the mechanical and corrosion properties of an alloy. The EBSD phase maps could be useful in identification and distribution of different phases in the alloys. Figure 1 shows the phase maps for untreated, heated and cryo-treated specimens depicting the significant precipitation of different phases in different cases. Figure 2 reports the results obtained through EBSD analysis clarifying that the heat treatment (Figure 2b) and cryogenic treatment (Figure 2c) bring about recrystallized structure in the material. A low angle grain boundary is typically the boundary between two crystal grains with a misorientation of less than 15° [36,37].

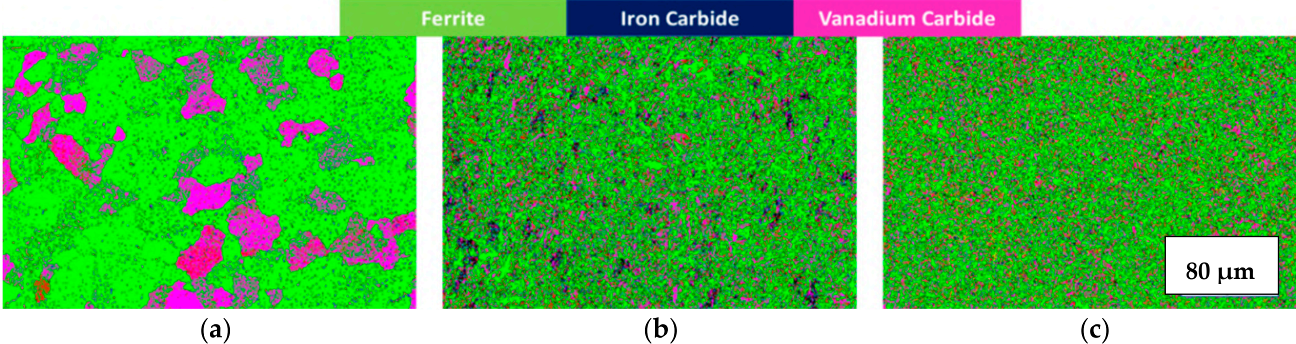

Figure 1. Maps depicting the main phase of studied material: (**a**) untreated, (**b**) heated and (**c**) cryo specimens.

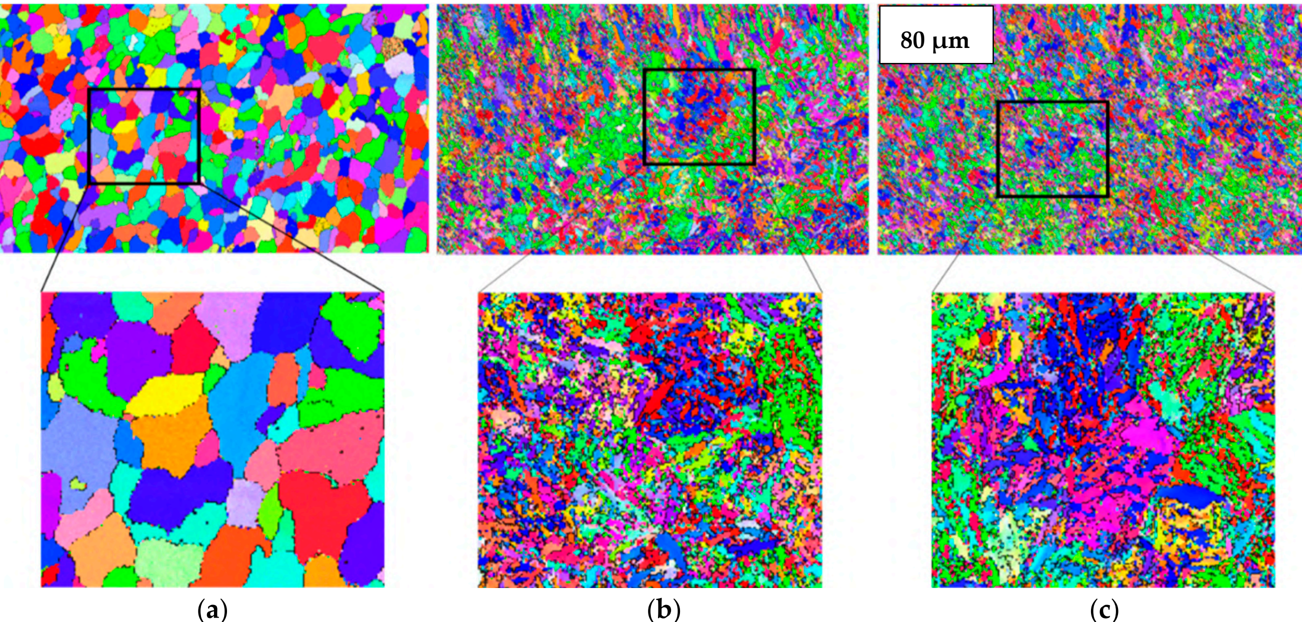

Figure 2. Inverse pole figure map obtained from EBSD analysis for (**a**) untreated, (**b**) heated and (**c**) cryo specimens.

Figure 3 elaborates the low angle grain boundary (LAGB) patterns for untreated, heated and cryo specimens which indicate that the as-received specimen has a limited number of LAGBs (noted by green) while heat-treated and cryo specimens show more LAGBs which could be attributed to the recrystallized structure in both specimens.

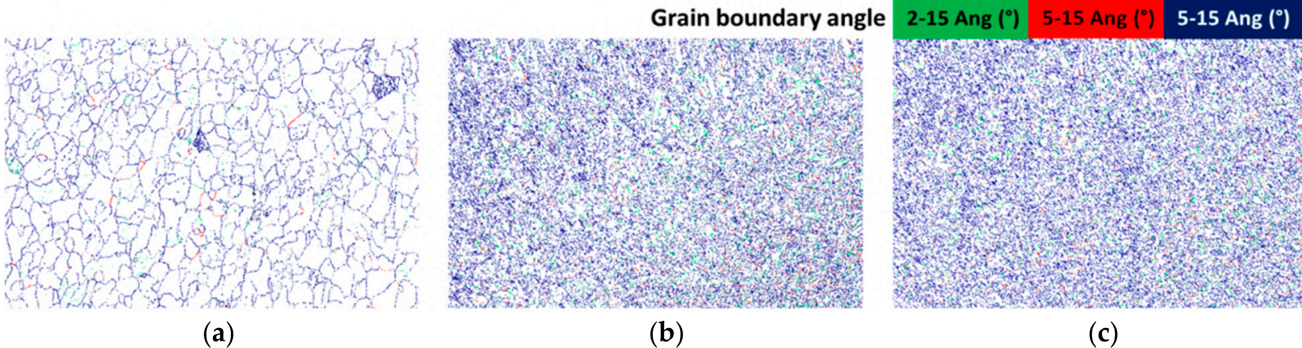

Figure 3. LAGBs for (**a**) untreated, (**b**) heated and (**c**) cryo specimens.

The deep cryogenic treatment of H13 steel resulted in a fine-grained structure. As geometrically necessary dislocation (GND) density measurement by EBSD has become a very popular tool in microstructural analysis [38], Figure 4 presents the geometrically necessary dislocation evolution of untreated, heated and cryo-treated specimens. It is observed from the GND maps that the dislocation density trend is untreated < heated < cryo; the highest dislocation density is found for cryo specimens (10^{14}–10^{15}), which could be attributed to increased plastic strain, resulting in accumulation of dislocations at the grain boundary areas for cryo specimens of H13 steel.

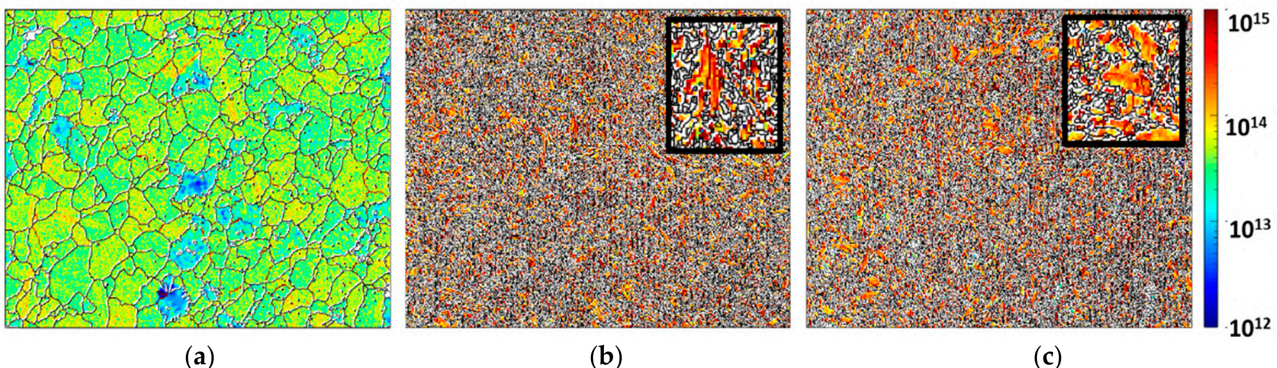

Figure 4. Geometrically necessary dislocation evolution of (**a**) untreated, (**b**) heated and (**c**) cryo-treated specimens.

Figure 5 represents the grain size variation for untreated, conventionally heat-treated (heated) and 16 h cryogenically treated (cryo) specimens. The graph illustrates that the grain size is minimal for 16 h cryogenically treated H13 steel for both conditions (before and after corrosion). The cryogenic treatment assists in the precipitation of fine carbides along the grain boundaries which inhibits the grain growth, resulting in a fine-grained structure [39]. Minimum grain size depicts the maximum grain boundary area inside the material. It has been shown by some authors that the grain refinement leads to increased susceptibility to corrosion [40–42], but the passivity of the film present on the surface plays a vital role in deciding the response of the material to corrosion. When untreated specimens are compared with conventionally treated (heated) ones, there is a reduction in grain size and, as stated by some authors, the corrosion resistance would be greater if the passivity of the film is maintained even for a fine-grained material [43–45].

3.2. Electrochemical Results

The electrochemical corrosion activity was investigated in 3.5% NaCl at 23 ± 0.5 °C by evaluating the evolution of open circuit potential (OCP) over time (Figure 5) and potentiodynamic curves (Figure 6). The open circuit potential (OCP) is a parameter that is related to the protective ability of the passive film. During 1 h of immersion, the OCP value slightly changed, indicating that steady-state conditions were not reached (Figure 5). Based on the results presented in Figure 6, one may see that the "cryo" specimen has an electropositive value of E_{oc}, indicating a good resistance to NaCl attack.

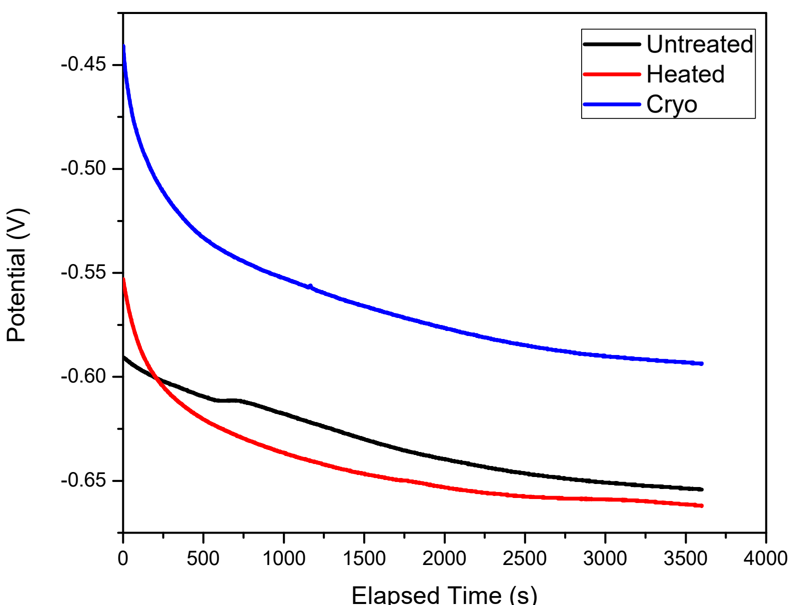

Figure 6. Evolution of the open circuit potential over time.

Figure 7 represents the polarization curves of the investigated surfaces. Based on Tafel extrapolation [46], the main corrosion parameters were extracted from Figure 6 and presented in Table 1, as frequently reported [47]. Heated specimens exhibited a more electropositive value of the corrosion potential (E_i = 0) compared to the uncoated and cryo specimens, indicating that the corrosive solution had less influence on their surfaces. The cryo specimen had a more electronegative corrosion potential, showing poor corrosion resistance to NaCl attack. Lower corrosion current density (i_{corr}) and higher polarization resistance (R_p) values were observed for heated specimens, showing good

DIRECTOR
Satara

corrosion resistance. Taking into account the electrochemical parameters, it can be said that heated specimens exhibited the best corrosion resistance to 3.5% NaCl, followed by the untreated and the cryo specimens.

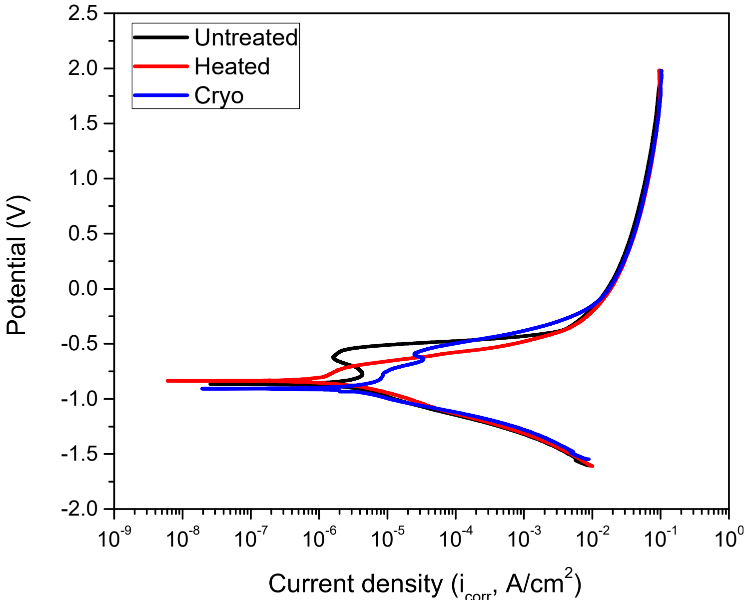

Figure 7. Potentiodynamic curves of investigated surfaces.

Table 1. Main corrosion parameters of untreated, heated and cryo specimens. $E_i = 0$: corrosion potential; i_{corr}: corrosion current density; R_p: polarization resistance; P: porosity; P_e: protective efficiency; CR: corrosion rate.

Sample	$E_i = 0$ (mV)	i_{corr} ($\mu A/cm^2$)	R_p ($k\Omega$)	P	P_e (%)	CR (μm/year)
Untreated	−865	4.387	11.644	-	-	0.051
Heated	−835	1.303	20.917	0.532	70.3	0.015
Cryo	−906	2.005	9.130	1.199	54.3	0.023

The surface porosity (P) was estimated based on Elsner's empirical equation [48,49] taking into account the values of polarization resistance (R_p) before and after applied treatments. Moreover, the protective efficiency (P_e) was also calculated based on the formula reported in [49], considering the ion corrosion densities of the untreated substrate and treated substrates. The corrosion rate (CR) has been estimated according to ASTM G102-89 standard (reapproved 2015) [50], using the following equation:

$$CR = K_i \frac{i_{corr}}{\rho} EW \tag{1}$$

where CR = corrosion rate, $K_i = 3.27 \times 10^{-3}$, ρ = materials density, i_{corr} = corrosion current density and EW = equivalent weight.

Taking into account the values of porosity, one may see that the alloy exhibited low porosity after heating, compared with the cryogenically treated alloy. Moreover, the protective efficiency in response to NaCl attack is higher in the case of the heated alloy when compared to the cryo alloy. The corrosion rate can be estimated in the following order: untreated > cryo > heated alloy. The high corrosion rate of cryogenically treated alloy can be attributed to the high porosity of the surface. However, it can be summarized that the best corrosion resistance was found for the heat-treated alloy and cryogenically treated alloy.

Electrochemical impedance spectroscopy (EIS) was used to investigate the electrochemical behavior of the investigated systems, highlighting the surface properties. For this purpose, the applied amplitude of the perturbation signal was 10 mV RMS vs. Eoc in a frequency range of 0.1–10^4 Hz. The impedance data were displayed as a Nyquist plot (Figure 8). According to this plot, one may observe that the specimens exhibit a better protection with increasing order from left to right as cryo < untreated < heated.

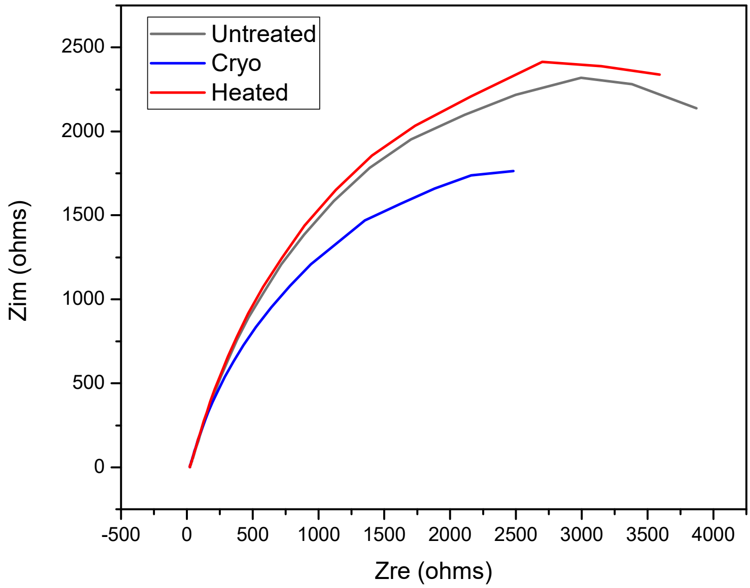

Figure 8. Nyquist plot for the investigated specimens.

3.3. Morphology before and after Electrochemical Tests

The morphology before and after electrochemical tests was evaluated by SEM analysis, and the results are presented in Figure 9. Before electrochemical tests, all surfaces appeared to be without defects or cracks. After corrosion tests, each surface was affected differently. The surface of the untreated alloy was destroyed on all corroded areas. At the magnification of 5000×, some precipitation of oxides of Al, Cr and Fe can be seen, as can the NaCl precipitates from the corrosive solution. The heated alloy is more resistant to corrosion, having a localized corrosion in some parts of the corroded region. On this surface, some oxides of Al, Cr and Fe can be seen, having a high affinity to oxygen. Some holes can also be observed, indicating that the corrosive solution penetrated more deeply. In the case of cryogenically treated alloy, many cracks appeared on the surface after the electrochemical tests. One possibility is that these cracks could be attributed to the destruction of the oxides. The heated AISI H13 steel displays better corrosion resistance compared to untreated AISI H13, and their corrosion resistance is comparable to that of the cryogenically treated alloy. In order to explain more about the corrosion process, the investigation of the roughness of the specimens was performed before and after corrosion tests.

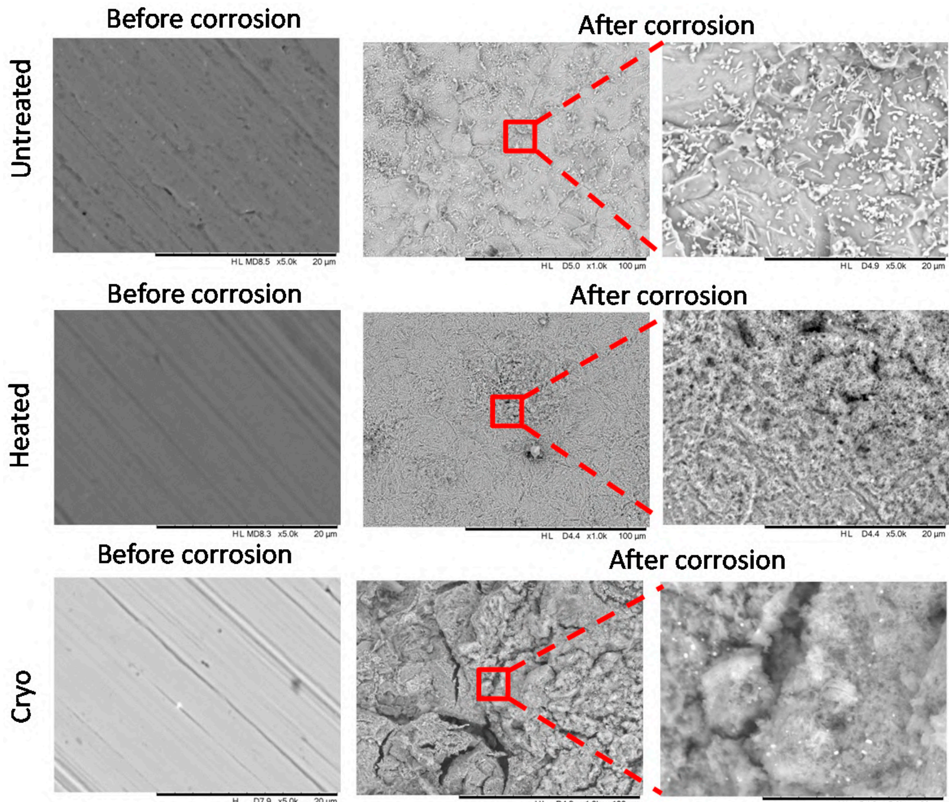

Figure 9. SEM images of the investigated specimens before and after corrosion.

3.4. Roughness before and after Electrochemical Tests

The roughness was evaluated on a length of 10 mm by a surface profilometer (Dektak 150, Bruker, Billerica, MA, USA) equipped with a 2.5 µm diameter stylus. For evaluation of roughness, two main parameters were calculated: arithmetic average deviation from the mean line (R_a) and skewness (S_{kew}). In Figure 10, the histograms of both calculated roughness parameters captured before and after electrochemical tests are presented. According to the R_a parameter, one may note that the roughness of all investigated surfaces was significantly increased after corrosion tests, indicating that all surfaces were affected by the corrosive solution. The heated and cryo alloys exhibited almost similar values of R_a, indicating that both surfaces exhibited comparable corrosion behavior. More relevant is the skewness parameter. A negative value of S_{kew} implies a surface formed of many valleys, while a positive value suggests a surface formed of mainly peaks and asperities. A S_{kew} with a value close to 0 suggests a flat surface. Taking into consideration these states, one may see that the untreated surface has an almost flat surface before corrosion and a surface with many peaks after corrosion. This finding demonstrated that the corrosive solution digs into the material and forms many pits. The heated alloy has a negative S_{kew} before corrosion tests, meaning that the surface has many valleys, which are transformed to high peaks after corrosion tests, indicating that the surface is significantly affected by the corrosive solution. The same phenomenon was also found in the case of the cryogenically treated surface. Note that the differences found for the cryo surface are small compared to those found for the heated surface, indicating that the cryo surface is more resistant to corrosion in 3.5% NaCl.

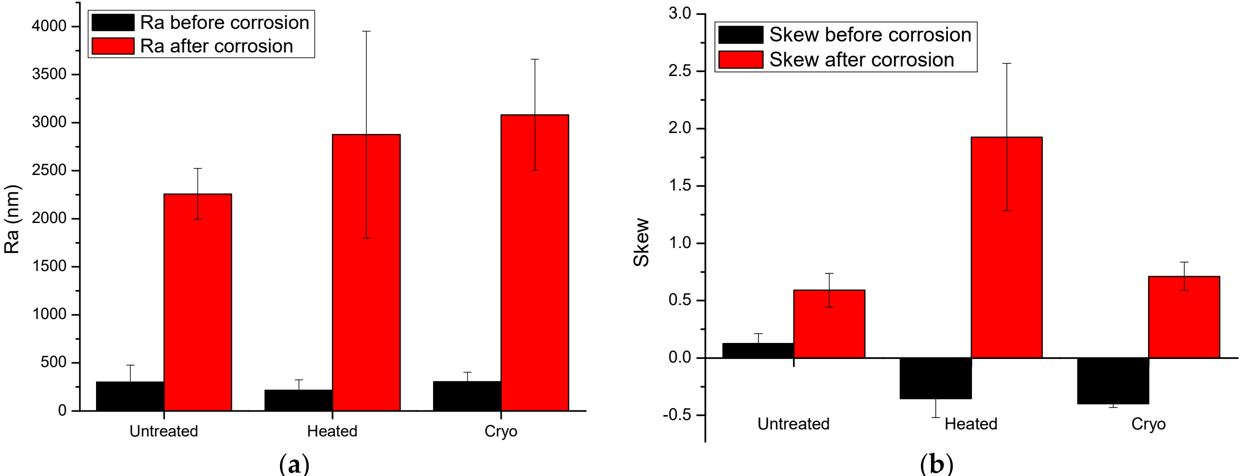

Figure 10. Roughness parameters: (**a**) R_a—arithmetic average deviation from the mean line; (**b**) S_{kew}—skewness of the investigated specimens before and after corrosion resistance.

4. Discussion

Based on the results obtained through corrosion tests, it can be said that the grain boundaries play a very important role in deciding the properties of materials under different service conditions for all types of treatments. High geometrically necessary dislocation (GND) density has been noted for 16 h cryogenically treated AISI H13 specimens (cryo specimens), which could be attributed to the increased plastic strain or strain hardening resulting in the accumulation of dislocations at the grain boundary areas. A reduction in grain size has been observed in the case of 16 h cryogenically treated specimens (cryo specimens), which could be attributed to the precipitation of fine carbides at the grain boundaries inhibiting the grain growth [12]. The highest values of open circuit potential (OCP) for AISI H13 cryo specimens indicate that these specimens are good in resisting the attack of NaCl as compared to untreated and heated specimens. The heated specimens have shown good results in the case of polarization curves with Tafel's extrapolation and estimation of surface porosity as compared to heated and cryo specimens. This indicates that the heated specimens form a protective and passive layer on the surface of the specimen. The Nyquist plots are also in agreement with the results for heated specimens. The SEM plots indicate a broken film in the case of cryo specimens, which could have resulted in increased corrosion; however, the reasons for the breakage of the film need to be determined.

Surface roughness evaluations are essential in analysing the response of materials to corrosive environments. There was a significant increase in the roughness for all types of specimens as an effect of the corrosive atmosphere. The skewness parameters evaluated for untreated, heated and cryo specimens indicate that the cryo specimens have better corrosion resistance as compared to the other two types, which could be attributed to the less significant impact of the corrosive atmosphere on cryo specimens.

One of the important aspects that need to be discussed is the influence of mechanical properties on the corrosion behavior of the materials. In this case, if the hardness is compared amongst the three categories (i.e., untreated, heated and cryo-treated), it can be seen that the hardness increases as follows: untreated (42 HRC) < heated (50 HRC) < cryo (56 HRC). The increase in hardness could be the result of the conversion of retained austenite into martensite after cryogenic treatment and the precipitation of fine carbides in the matrix of tempered martensite [12,21]. The grain refinement is also one of the reasons for the improvement in hardness. Based on these results for hardness, it can be stated that increased martensitic content indicates better corrosion resistance as in the case of cryo specimens [51].

In summary, heated and cryo specimens of AISI H13 exhibit better resistance to corrosion as compared to untreated material, and deep cryogenic treatment is useful in improving the corrosion resistance.

5. Conclusions

The current research work was aimed at investigating the corrosion behavior of cryogenically treated AISI H13 die steel. The following points summarize the major outcomes:

- The deep cryogenic treatment is beneficial in improving the corrosion resistance of AISI H13 material and could be useful in applications involving high mechanical stress and a corrosive environment.
- The grain boundaries decide the corrosion characteristics of the material; increased geometrically necessary dislocations indicate higher plastic straining. There is a reduction in grain size for AISI H13 specimens subjected to 16 h deep cryogenic treatment, which is attributed to the precipitation of fine carbides at the grain boundary areas.
- Parameters such as higher open circuit potential and skewness indicate that H13 specimens subjected to deep cryogenic treatment have a better response to a corrosive environment, whereas the surface porosity measurements and Nyquist plots confirm the superior response of heated specimens to a corrosive atmosphere.

Overall, it can be concluded that deep cryogenic treatment is useful in improving the corrosion properties of H13 die steel. Some further investigations of material surfaces exposed to a high-temperature corrosive environment could also reveal some important outcomes for H13 steel.

ABSTRACT

Layout design and selection often have notable effects on the performance of the manufacturing industry. This research investigates the Multi-Criteria Decision Making (MCDM) approach to find out the optimum plant layout design. The proposed methodology is demonstrated through the real-life setting for the gearbox manufacturing industry. Manual and computerized layout generation approach is used efficiently and accordingly, six layout designs are generated. The approach takes into account qualitative as well as quantitative performance criteria for the selection of layout design. Analytical Hierarchy Process (AHP) is applied to obtain the weight of qualitative measures. Ranking of alternatives is obtained through the application of Technique for Order Preference by Similarity to Ideal Solution (TOPSIS) and Weighted Aggregated Sum-Product Assessment (WASPAS) both integrated with the Entropy method. Empirical findings indicate that the rank acquired using the TOPSIS method is perfectly parallel to those acquired through the WASPAS method, which confirms the applicability and potential of these methods. Also, the effect of the parameter λ in WASPAS method on performance score is stable. At the same time, this paper analyses the rank reversal phenomenon and proves that the ranking proposed by TOPSIS satisfies ranking stability.

1. Introduction

Plant layout is an arrangement of sections, subsections, departments, stations and storage space within the existing or proposed facility. The effective layout of the industry is of enormous significance for its effective use. Therefore to meet the required effectiveness, setup should be able to quickly shift gears from one product to another without major alterations regarding available resources. Manufacturing industries producing the standard product such as gearbox require a lot of variation in the product and at the same time should be able to fulfil the growing demands in the market. The layout is classified as static, dynamic, multi-objective, multi-floor, equal area and unequal area. Among these, the design and selection of unequal area facility layout problems are the most critical task. This problem considers a set of rectangular areas and rectangular sub-areas (manufacturing facilities) and should be positioned so that they do not overlap in the production region. The selection of appropriate layout design is a Multi-Criteria Decision Making (MCDM) approach. This approach requires consideration of the qualitative and quantitative criteria, jointly. Qualitative measures include layout flexibility, maintenance, accessibility, human issue, plant safety and information flow while quantitative measures include layout cost or material handling cost, adjacency score i.e. closeness request, distance score, aspect ratio and production volume (Aiello et al., 2012; Yang & Kuo, 2003). A proper plant layout can improve efficiency and reduce material handling costs. Singh & Sharma (2006) focused on current and future research trends on layout problems of formulations and solution

methodologies. Pérez-Gosende et al. (2021) reviewed literature and performed an analysis based on manufacturing facility characteristics by configuring layout types, layout planning steps, material handling systems, and generation and evaluation of alternatives. Systematic Layout Planning (SLP) is a procedural approach and is successfully applied to solve real life problems of manufacturing industries to improve plant layout (Naqvi et al., 2016; Wiyaratn & Watanapa, 2010).

The construction algorithmic approach such as Automated Layout Design Program (ALDEP), Computerised Relationship Layout Planning (CORELAP) and BLOCPLAN has been proposed to create layout design alternatives (Hakim & Istiyantri, 2015; Rajesh et al., 2016; Tambunan et al., 2018). Hari Prasad et al. (2014) tackled the existing layout situation using the Computerized Relative Allocation of facilities Technique (CRAFT) approach for layout cost optimization. In addition commercial software like spiral and algorithms, Plant Layout Analysis and Evaluation Technique (PLANET), Computerised Facility Design (COFAD) were developed to resolve single floor layout problem whereas for multi floor design, Multi-floor Plant Layout Evaluation (MULTIPLE), Micro CRAFT (MCRAFT), Layout Optimization with Guillotine Induced Cuts (LOGIC) have been introduced by Hadi-vencheh & Mohamadghasemi (2013) and Moatari-Kazerouni et al. (2015).

Abdul-Hamid et al. (1999) presented AHP approach to select an appropriate layout design by considering three objectives viz. flexibility, production volume and manufacturing costs. Yang & Kuo (2003) in their YK model, proposed AHP and Data Envelopment Analysis (DEA) approach for ranking layout design. Also, Ertay et al. (2006) presented a similar methodology to rank the facility layout design. Case studies on railway system improvement and optimization using AHP/DEA methodology with computer simulation are reported by Azadeh et al. (2008). Yang & Hung (2007) applied the TOPSIS & fuzzy TOPSIS approach for layout design ranking and compared their results with the YK model. Sharma & Singhal (2017) applied fuzzy TOPSIS for selection of the best procedural approach of layout design. Agarwal & Singholi (2018) analysed AHP-TOPSIS and Fuzzy AHP- Fuzzy TOPSIS approach for alternative layout designs and compared with the existing design. Yang et al. (2013) used rough set theory, AHP and TOPSIS to choose the best energy efficient layout design alternative among the proposed layouts. Hadi-vencheh & Mohamadghasemi (2013) proposed NonLinear Programming model (NLP) in correlation with AHP to solve the facility layout problem. Kong (2011) studied the causes of rank reversal in TOPSIS and proposed subjective preferences set by decision-makers that helps for more scientific decision-making. Aires & Ferreira (2019) defined a framework to evaluate the TOPSIS method and suggested models related to the different cases of rank reversal. García-Cascales & Lamata (2012) studied the causes of rank reversal in the TOPSIS related to the normalization method. There is a scope for applying improved methods such as AHP-TOPSIS and WASPAS by integrating with the Entropy method for selection of optimum layout design for the problem under consideration i.e. modification of plant layout of the gearbox manufacturing industry. It is worth mentioning that no literature reported on rank reversal related to layout selection. The present study is focused on finding the optimum layout design for the unequal area and irregular shape department of a gearbox manufacturing plant by considering both qualitative and quantitative measures. Section 1 consists of an introduction and literature survey. Section 2 includes data collection and analysis of existing layout. Section 3 articulates generation of alternative layouts. In Section 4, the details of performance measures and application of the AHP approach are presented. Section 5 analyses two MCDM approaches for optimum layout selection. Section 6 proposes a rank reversal study. Section 7 highlights the conclusion related to this study.

2. Data collection and existing plant layout

The industry manufactures standard as well as custom range planetary gearbox of various models. The list of various departments and the area requirement for each department is summarized in Table 1. A block layout of the existing plant layout of these 14 departments is as shown in Fig. 1. The industry is facing a shortage of supply of products that lead to not satisfying the demands and thus the scope is identified in terms of modification and optimization of the layout. It has been analysed that there is a necessity for improving the existing plant layout by applying systematic approaches that will lead to improving productivity with effective utilization of resources. Various alternatives have been studied for comparison and for suggesting the optimum solution.

Table 1
Departments and their area

Sr. No.	Name of Department	Area
0	Office	660.00

3. Generation of alternative layout designs

3.1 SLP approach

By using the SLP approach the layout is generated as mentioned below. For different sections/ activities of production of a single gearbox, From-To-Chart as shown in the Table 2 is constructed which represents the interaction between departments and rectilinear distance. By the addition of these, flow distance in the existing situation is 960.11 feet.

Table 2
From-To-Chart for existing layout

From/To	1	2	3	4	5	6	7	8	9	10	11	12	13
1.Raw material store-A	0	0	0	159.68	0	0	0	0	0	0	0	0	0

13.Maintenance	0	0	0	0	0	0	0	0	0	0	0	0	0

In the present study, for identifying the relative importance between the departments and for selecting the reasons of the closeness for the departments, the opinions of industry experts are taken into account. Table 3 summarizes the different reasons for closeness of the departments.

Table 3
Reasons for closeness

Sr. No.	Reason
1	Material flow
2	Supervision and control
3	Share the same personnel
4	Communication need

To decide the ranking of the relationship between departments, the ranking system mentioned by Muther & Hales (2015) is used and is reported in Table 4.

Table 4
Closeness values and their rating of the relationship chart

Value	Closeness	Rating	Colour Code	Meaning
A	Absolutely necessary	6		Must be next to each other
E	Especially important	5		Need to be very close
I	Important	4		Need to be on same floor, side or wing
O	Ordinary closeness Okay	3		Occasional interaction.
U	Unimportant	2		Infrequent interaction.

X	Not Desirable	1		Keep separate and away

Based on the reasons for closeness, the relationship chart is presented in Fig. 2.

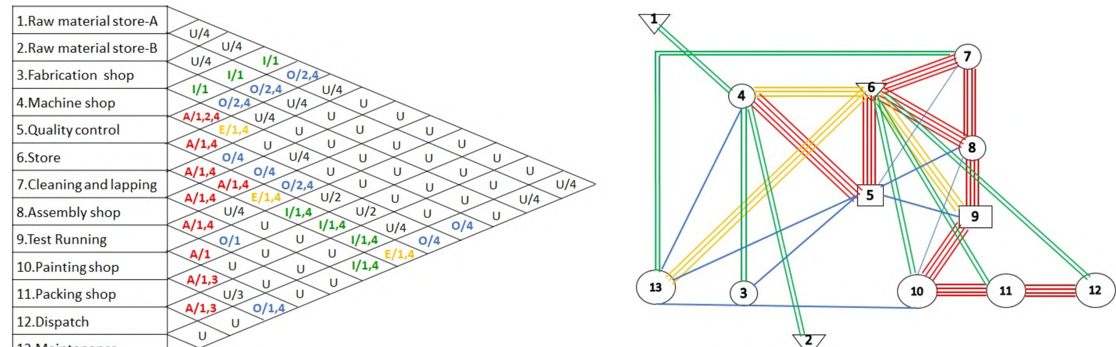

Fig. 2. Relationship chart **Fig. 3.** Activity relationship diagram

Accordingly, activity relationship diagram (Fig. 3) and space relationship diagram (Fig. 4), are developed.

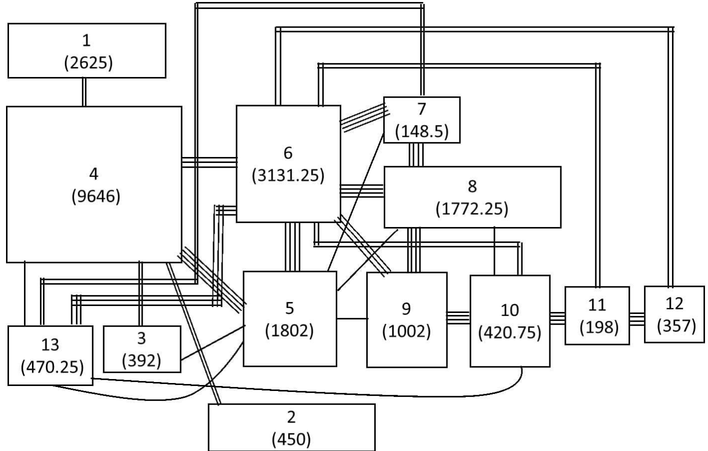

Fig. 4. Space Relationship Diagram

For designing the layout based on SLP method, the following requirements are considered.

1. Location of office, raw material store A and raw material store B are kept as it is.
2. Location of quality control and maintenance department is kept at the outer side of layout for ease of loading and unloading of semi-finished material came from vendors and gearboxes came for maintenance purpose. After applying all conditions, layout alternative is developed (Fig. 5).

DIRECTOR
Yashoda Technical Campus
Satara

Fig. 5. Layout based on SLP method

3.2 Flow patterns

Based on the flow patterns, we generate two layout designs as S flow pattern (Fig. 6) and U flow pattern (Fig. 7). In these designs, the arrangement of departments is made as per the operations sequence and production tasks.

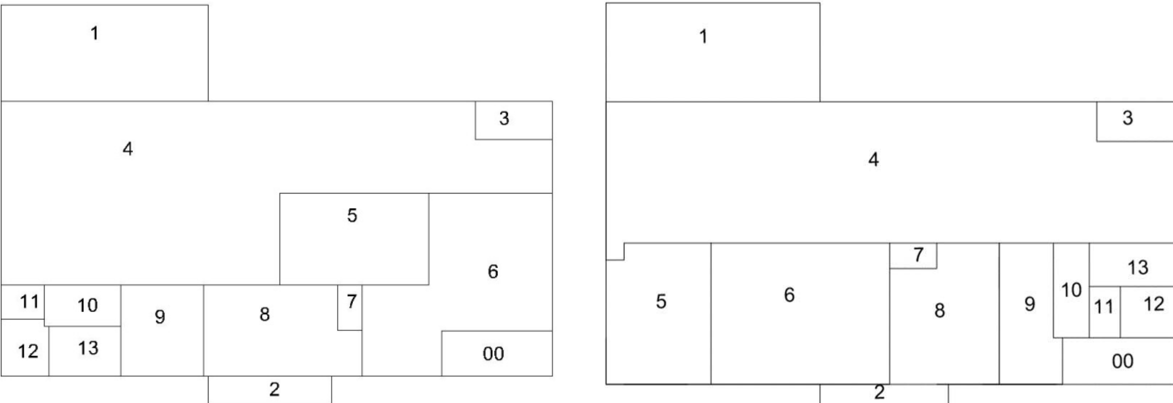

Fig. 6. Layout based on "S" shaped flow pattern **Fig. 7.** Layout based on "U" shaped flow pattern

3.3 ALDEP algorithm

This approach constructs the design by putting the departments in the layout successively. A layout score is calculated after putting all the departments. Table 5 shows the symbols and values mentioned by Panneerselvam (2017) to indicate the degree of closeness between departments.

Table 5
Symbols and values of Closeness

Closeness	Notations	Value
Absolutely necessary	A	64
Especially important	E	16
Important	I	4
Ordinary closeness Okay	O	1
Unimportant	U	0
Not Desirable	X	-1064

In the layout matrix, placement of department is from upper left corner to lower right corner whereas sweep width is user defined. In the present study, considering sweep width 5, minimum department preference is A, E and I, layout matrix size is 55 × 40 and 1 Cell equals to 9.09 Square Feet. Table 6 indicates the number of the squares for all the departments.

Table 6
Department and number of squares

Department No.	0	1	2	3	4	5	6	7	8	9	10	11	12	13
No. of Square	73	289	50	43	1061	198	345	16	195	110	46	22	39	52

In the first design, layout generation starts from a random selection of departments (department No.3). Department No. 4 has an "A" relationship with department No. 3, therefore its placement is next to department 3. Similarly, departments 5,6,7,8,9,10,11 and 12 has "A" relationship with departments 4,5,6,7,8,9,10 and 11, respectively, so they are placed next to previously placed departments. In the placement sequence, only department 13 is left which is placed at last and accordingly layout is generated as shown in Fig. 8. Applying the same procedure, ten alternative layouts are generated. After the generation of alternative layout designs, layout score is computed. Table 7 displays the closeness rating between the departments and the layout score of the first alternative. Similarly, for the remaining ten layout designs, the computed score is listed in Table 8.

Table 7
Closeness of department and layout score

Department	3-4	4-5	4-6	5-6	6-10	6-7	6-8	7-8	7-9	8-9	9-10	9-11	9-12	9-13	10-11	11-12	12-13	6-9	Layout score
Closeness	I	A	E	A	I	A	A	A	U	A	A	U	U	U	A	A	U	E

Value	4	64	16	64	4	64	64	64	0	64	64	0	0	0	64	64	0	16	**616**

Fig. 8. Layout generated by ALDEP

Table 8
Alternative layout score and respective rank

Alternative Layout	Sequence	Score	Rank
1	3-4-5-6-7-8-9-10-11-12-13	616	1
2	4-5-6-7-8-9-10-11-12-13-3	594	3
3	5-4-6-7-8-9-10-11-12-13-3	530	8
4	6-5-4-3-7-8-9-10-11-12-13	468	9
5	7-8-9-10-11-12-6-5-4-3-13	562	4
6	8-6-7-13-9-10-11-12-5-4-3	438	10
7	9-10-11-12-6-7-8-5-4-3-13	546	6
8	10-11-12-6-7-8-9-5-4-3-13	547	5
9	11-12-6-5-4-3-13-7-8-9-10	418	11
10	12-11-10-9-8-7-6-5-4-3-13	616	2
11	13-6-7-8-9-10-11-12-5-4-3	535	7

The alternative of having a maximum score is to be considered as the solution. Table 7 shows the maximum score as 616, but it is for two alternatives 1 and 10. To resolve this tie for selection of the first rank, total flow distance and practical limitations are considered and based on that alternative is ranked as 1.

3.4 CRAFT algorithm

The first alternative (Fig. 8) developed from ALDEP is considered as the existing layout (starting point). Possible pairwise interchanges of the departments are taken into account. For all these pairs, assuming 1 trip per hour and ₹1 per trip, layout cost is calculated using Eq. (1) given by Deshpande et al. (2016).

$$\min z = \sum_{i=1}^{m}\sum_{j=1}^{m} f_{ij}c_{ij}d_{ij} \tag{1}$$

where,

z is layout cost per hour
m is number of the department
f_{ij} is the number of trips between departments i and j
c_{ij} is the cost to make one trip between departments i and j
d_{ij} is the distance from department i to j

After carrying pairwise interchange for possible departments, the interchange of departments 6 and 7 gives the minimum cost of ₹ 739.07. This cost is less than the cost ₹ 960.11 of the existing layout. This change is accepted and accordingly the interchange of the selected pair of the departments is done. In the second iteration, possible interchanges are identified and the computed costs for each interchange are summarized in Table 9.

Table 9
Pairwise interchange and respective cost

Pair No.	Pairwise interchange	Cost per hour	Pair No.	Pairwise interchange	Cost per hour	Pair No.	Pairwise interchange	Cost per hour
1	3-4	749.26	7	7-6	739.07	13	9-11	883.16
2	4-5	855.44	8	6-10	1024.28	14	9-12	875.06
3	4-7	1113.15	9	6-9	940.30	15	9-13	1024.92
4	4-6	930.21	10	6-8	858.96	16	10-11	802.99
5	5-6	845.95	11	8-9	770.19	17	11-12	797.97
6	5-7	768.83	12	9-10	871.19			

From Table 9 it is clear that the costs pair-wise interchange is least for pair No.7 and therefore, this is considered as stopping criteria for the algorithm. The solution in term of layout from the CRAFT algorithm is shown in Fig. 9.

Fig. 9. Layout generated by CRAFT

3.5 CORELAP method

Using the relationship chart, Total Closeness Rating (TCR) is computed for all the departments. Relationship between departments in the existing layout is shown in Table 10 while TCR and rank of each department are shown in Table 11.

Table 10
Relationship of department

Department	3	4	5	6	7	8	9	10	11	12	13
3.Fabrication shop	-	I/1	O/2,4	U/4	U	U	U	U	U	U	U

Table 11
TCR values and placement sequence

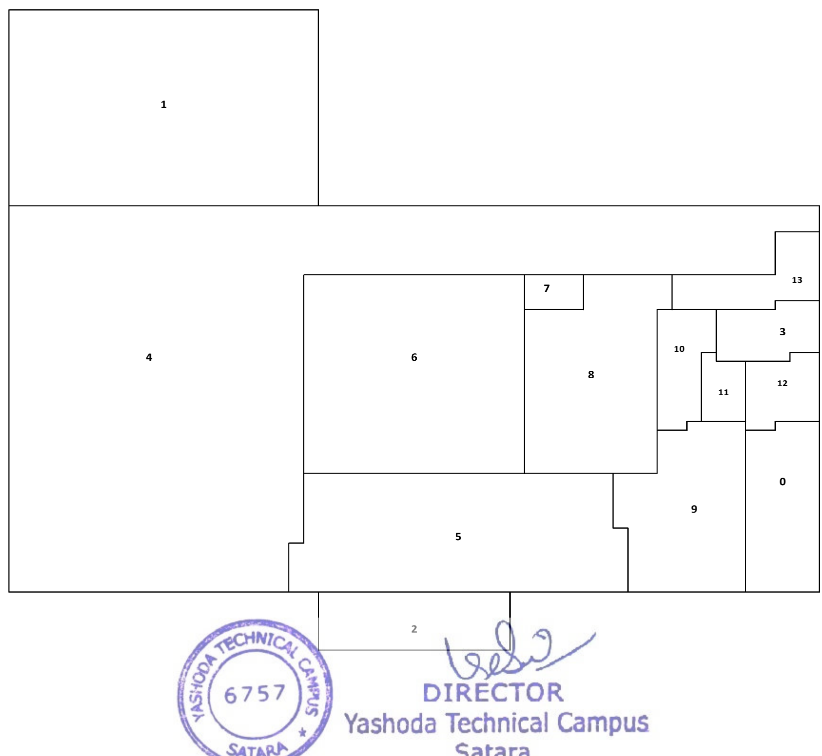
Department	3	4	5	6	7	8	9	10	11	12	13	TCR	Placement Sequence
3.Fabrication shop	0	4	3	2	2	2	2	2	2	2	2	23	11
4.Machine shop	4	0	6	5	2	2	2	2	2	2	3	30	7
5.Quality control	3	6	0	6	3	3	3	2	2	2	3	33	3
6.Store	2	5	6	0	6	6	5	4	4	4	5	47	1
7.Cleaning and lapping	2	2	3	6	0	6	2	2	2	2	4	31	6
8.Assembly shop	2	2	3	6	6	0	6	3	2	2	2	34	2
9.Test Running	2	2	3	5	2	6	0	6	2	2	2	32	4
10.Painting shop	2	2	2	4	2	3	6	0	6	2	3	32	5
11.Packing shop	2	2	2	4	2	2	2	6	0	6	2	30	8
12.Dispatch	2	2	2	4	2	2	2	2	6	0	2	26	10
13.Maintenance	2	3	3	5	4	2	2	3	2	2	0	28	9

As an illustration, the department No.6 (store) has the largest TCR, so it is selected at first place in placement order. In second place, the department No.5 having the strongest relationship with the department No.6 is placed. This is repeated for placing the remaining departments in placement sequence and accordingly placement order is generated as 6-5-8-7-4-9-13-10-11-12-3. As per placement rule of CORELAP, department No.6 (first in the sequence) is placed at the center of layout. The department No.5 (second in the sequence) is kept adjacent to department No.6. For placing department No.8 which is at third place in sequence, three combinations are possible. Therefore, based on maximum Placement Rating (PR) the position of department No. 8 in the sequence is decided. PR is expressed in terms of the sum of the weighted closeness rating and their values are mentioned in Table 12 as taken from Panneerselvam (2017).

Table 12
Weighted closeness rating values

Closeness relationship	Pre-assigned	A	E	I	O	U	X
Weighted Rating	729	243	81	27	9	1	-729

PR calculation in the present study is illustrated as follows. In the first arrangement, department No. 8 is placed adjacent to department No. 6 then the closeness relationship between them is “A” having weighted rating 243. Similarly, in the second arrangement department No. 8 is placed adjacent to departments No. 6 and department No. 5, hence, the close relationship between them is “A” and “O” while weighted rating is 243 and 9 which gives PR equal to 243 + 9 = 252. As per the third arrangement, department No. 8 can be placed adjacent to department No. 5, then the closeness relationship between them is “O” whereas weighted rating is 9. Based on maximum PR the second arrangement is considered. These steps of identifying the closeness and calculating the placement rating are repeated for the placement of remaining departments and accordingly a new layout as shown in the Fig. 10 is generated.



YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Fig. 10. Layout generated by CORELAP

4. Performance measures and AHP method

To evaluate the performance of the generated layouts, various metrics such as flow distance, adjacency score, aspect ratio, production volume, cost of the manufactured component, flexibility, accessibility, maintenance, human issue, information flow, machine reconfigurability, and quality factors are available in the literature (Abdul-Hamid et al., 1999; Agarwal & Singholi, 2018; Aiello et al., 2012; Goyal et al., 2012). Based on expert advice from the industry and based on literature study, the qualitative performance measures selected are flexibility, accessibility, maintenance, and human issue and quantitative performance measures considered are flow distance and adjacency score. The objectives are to minimize flow distance and to maximize remaining five performance measures. For finding the value of the qualitative measures, AHP method which has certain advantages as mentioned by Ertay et al. (2006) is applied. The decision hierarchy of AHP in this case is shown in Fig. 11. The terms A1, A2, A3, A4, A5, and A6 are used for layout generated by SLP, "S" type flow, "U" type flow, ALDEP, CRAFT and CORELAP, respectively.

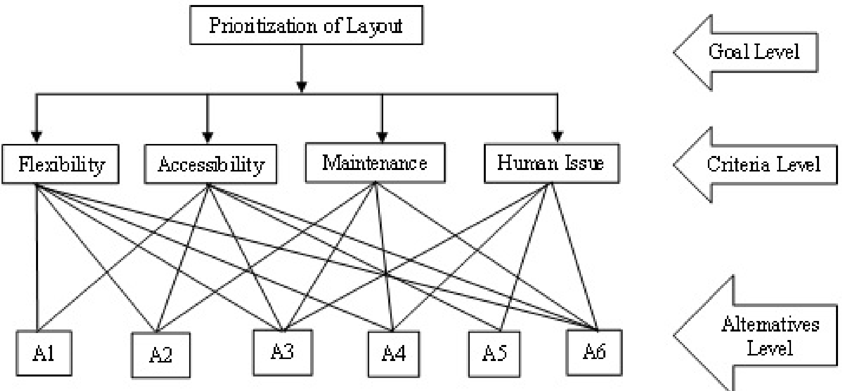


Fig. 11. Decision hierarchy for qualitative criteria in the layout selection

In the layout design problem, all the performance measures will not have the same importance. Therefore, a pairwise comparison is applied in the second step to determine the comparative significance of the performance and alternatives (layouts) according to their influences. Construction of a comparative matrix by a pairwise comparison based on designer preference can be done using a numerical scale shown in Table 13 as mentioned in Yang & Kuo, (2003).

Table 13
Nine-point intensity of importance scale

Intensity of Importance	Definition
1	Equal Importance
3	Moderate Importance
5	Strong importance
7	Very strong importance
9	Extreme importance
2,4,6,8	Intermediate values between the two adjacent judgments

The comparison matrices for all the four criteria are generated using numerical scale values. The matrix for flexibility criteria is shown in Table 14 as an example.

Table 14
Pairwise comparison matrix of flexibility

Alternative	A1	A2	A3	A4	A5	A6
A1	1	3	3	7	7	7
A2	1/3	1	3	5	5	5
A3	1/3	1/3	1	5	5	3
A4	1/7	1/5	1/5	1	1/3	1/3
A5	1/7	1/5	1/5	3	1	2
A6	1/7	1/5	1/3	3	1/2	1

After developing the comparison matrix, normalization is done. For example, in the case of alternative 1, the normalised value is calculated as 1/ (1+ 0.33 + 0.33 + 0.14 + 0.14 + 0.14) = 0.477. Subsequently arithmetic mean is computed that gives criteria weight. For alternative 1 criteria weight equal to (0.477 + 0.608 + 0.388 + 0.292 + 0.372 + 0.382) / 6 = 0.420. Table 15 displays a normalized matrix and criteria weight for flexibility criteria.

Table 15
Normalised matrix and criteria weight

Alternative	A1	A2	A3	A4	A5	A6	Criteria weight
A1	0.477	0.608	0.388	0.292	0.372	0.382	0.420
A2	0.159	0.203	0.388	0.208	0.265	0.273	0.249
A3	0.159	0.068	0.129	0.208	0.265	0.164	0.166
A4	0.068	0.041	0.026	0.042	0.018	0.018	0.035
A5	0.068	0.041	0.026	0.125	0.053	0.109	0.070
A6	0.068	0.041	0.043	0.125	0.027	0.055	0.060

Then, weighted sum is the sum of product of each value in a pairwise comparison matrix to criteria weight of the corresponding alternative. For example, in case of alternative 1, the weighted sum equals (0.420 ×1) + (0.249 ×3) + (0.166 × 3) + (0.035 ×7) + (0.070 ×7) + (0.060 ×7) = 2.82. This weighted sum is divided by criteria weight for computation of weighted priority. In case of flexibility criteria, weighted priority of alternative 1 equal to (2.82 / 0.420) = 6.722. In the same manner, weighted priority is calculated for all criteria and alternatives. Subsequently, averaging the results of each row is done which gives the maximum eigenvalue (λ max). For flexibility, λ max is calculated as (6.722 + 6.867 + 6.618 + 6.269 + 6.240 + 6.134) / 6 = 6.475. Similarly, λ max for the remaining three qualitative measures are computed and listed in Table 16.

Table 16
Criteria and respective eigenvalues (λ max)

Criteria	Flexibility	Accessibility	Maintenance	Human Issue
λ max	6.475	6.383	6.354	6.465

The Consistency Index (CI) is expressed by Eq. (2).

$$(\mathrm{CI}) = \frac{(\lambda_{\mathrm{Max}} - \mathrm{n})}{(\mathrm{n} - 1)} \tag{2}$$

where n is the number of compared alternatives. In case of flexibility, λmax is 6.475 and n is 6. Using Equation 2, CI equals to (6.475 - 6) / (6 - 1) = 0.095. Similarly, for remaining criteria, CI are computed (Table 17).

Table 17
Criteria and respective CI values

Criteria	Flexibility	Accessibility	Maintenance	Human Issue
CI	0.095	0.077	0.071	0.093

Consistency Ratio (CR) is computed by

$$(\mathrm{CR}) = \frac{(\mathrm{CI})}{(\mathrm{RI})} \tag{3}$$

Random index (RI) for different attributes (n) are listed in Table 18. When CR is greater than 0.1, this procedure is repeated to improve consistency (Hadi-vencheh & Mohamadghasemi, 2013).

Table 18
Random Index values for different values of n

n	3	4	5	6	7	8	9	10
RI	0.58	0.9	1.12	1.24	1.32	1.41	1.45	1.49

For example, CR for flexibility is equal to 0.095/1.24 = 0.077 and thus the CR values for all the criteria are computed and are listed in Table 19.

Table 19
Criteria and CR values

Criteria	Flexibility	Accessibility	Maintenance	Human Issue
CR	0.077	0.062	0.057	0.075

Since all CR values are not greater than 0.1, the findings are acceptable and show the goodness of the decisions. The values of quantitative performance measures are measured from layout designs discussed in previous section 3. The values of quantitative and qualitative measures under consideration are reported in Table 20.

Table 20
Performance measures values for layout alternatives

Layout Alternative	Quantitative Performance		Qualitative Performance			
	Flow Distance	Adjacency Score	Flexibility	Accessibility	Maintenance	Human Issue
A1	816.76	616	0.224	0.106	0.026	0.056
A2	834.17	599	0.133	0.074	0.018	0.039
A3	875.81	598	0.088	0.040	0.010	0.021
A4	777.69	616	0.019	0.015	0.002	0.006
A5	739.07	553	0.038	0.009	0.005	0.005
A6	900.88	597	0.032	0.019	0.004	0.010

5. Optimum layout design

For the selection of optimum layout design, MCDM methods namely TOPSIS and WASPAS are applied this case for determining the best solution amongst these six alternatives.

5.1 TOPSIS method coupled with Entropy method

For finding out the positive ideal solution and the negative ideal solution in the TOPSIS method the procedure mentioned by Behzadian et al. (2012) is adopted. After forming an initial decision matrix (Table 20), each element is normalized by Eq. (4).

$$r_{ij} = \frac{x_{ij}}{\sqrt{\Sigma x_{ij}^2}} \qquad \text{For } i = 1, \ldots\ldots, m;\ j = 1, \ldots\ldots, n \tag{4}$$

where x_{ij} and r_{ij} are the original and normalized values. For example, the normalised value of flow distance for alternative No.1 is calculated as,

$$r_{ij} = \frac{816.76}{\sqrt{816.76^2 + 834.17^2 + 875.81^2 + 777.69^2 + 739.07^2 + 900.88^2}} = 0.4037330$$

For remaining alternatives and criteria, normalized values are computed and reported in Table 21.

Table 21
Normalized decision matrix for TOPSIS

Alternative	Flow Distance	Adjacency Score	Flexibility	Accessibility	Maintenance	Human Issue
A1	0.4037330	0.4213320	0.8000000	0.7681159	0.7647059	0.7671233
A2	0.4123390	0.4097043	0.4750000	0.5362319	0.5294118	0.5342466
A3	0.4329221	0.4090203	0.3142857	0.2898551	0.2941176	0.2876712
A4	0.3844203	0.4213320	0.0678571	0.1086957	0.0588235	0.0821918
A5	0.3653301	0.3782412	0.1357143	0.0652174	0.1470588	0.0684932
A6	0.4453144	0.4083364	0.1142857	0.1376812	0.1176471	0.1369863

The weighted normalized decision matrix (v_{ij}) is given by Eq. (5).

$$v_{ij} = w_j r_{ij} \tag{5}$$

Weights of individual criteria are found by Entropy method (applied by Chen et al., 2014 for food industry). Normalizing decision matrix (Table 21) is again normalized by using Eq. (6).

$$r_{ij} = \frac{x_{ij}}{\sum_{i=1}^{m}(x_{ij})} \tag{6}$$

where x_{ij} and r_{ij} are the initial and normalized values. For example for cell (1,1) the value by entropy method is equal to (0.4037330) / (0.4037330 + 0.4123390 + 0.4329221 + 0.3844203 + 0.3653301 + 0.4453144) = 0.1651896. In this way the other values mentioned in the Table 22 are calculated.

Table 22
Normalized decision matrix for Entropy method

Alternative	Flow Distance	Adjacency Score	Flexibility	Accessibility	Maintenance	Human Issue
A1	0.1651896	0.1721151	0.4194757	0.4030418	0.4000000	0.4087591
A2	0.1687107	0.1673652	0.2490637	0.2813688	0.2769231	0.2846715
A3	0.1771324	0.1670858	0.1647940	0.1520913	0.1538462	0.1532847
A4	0.1572877	0.1721151	0.0355805	0.0570342	0.0307692	0.0437956
A5	0.1494768	0.1545124	0.0711610	0.0342205	0.0769231	0.0364964
A6	0.1822028	0.1668064	0.0599251	0.0722433	0.0615385	0.0729927

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

After normalization, next step is to calculate entropy value (e_j) which is calculated using Eq. (7).

$$e_j = -h \sum_{i=1}^{m} r_{ij} \text{In} r_{ij} \tag{7}$$

where, h = 1/ln (m) and m is number of criteria. Here m is 6, therefore h = 1/ln (6) = 0.5581. Using Eq. (7), entropy value of flow distance equal to -0.5581 × [(0.1651896 + ln 0.1651896) + (0.1687107 + ln 0.1687107) + (0.1771324 + ln 0.1771324 + (0.1572877 + ln 0.1572877) + (0.1494768 + ln 0.1494768) + (0.1822028+ ln 0.1822028)] = 0.9987357 and similarly other entropy values are computed and are summarized in Table 23.

Table 23
Entropy values

Criteria	Flow Distance	Adjacency Score	Flexibility	Accessibility	Maintenance	Human Issue
e_j	0.9987357	0.9996279	0.8277693	0.8249606	0.8293663	0.8146639

Weight factor (w_j) for each criteria is determined by Eq. (8).

$$w_j = \frac{1 - e_j}{\sum_{j=1}^{n}(1 - e_j)} \tag{8}$$

According to Table 23, entropy value (e_j) of flow distance is 0.9987357. Using Eq. (8), weight of flow distance is equal to (1 - 0.9987357) / (1 - 0.9987357) + (1 - 0.9996279) + (1- 0.8277693) + (1- 0.8249606) + (1- 0.8293663) + (1- 0.8146639) = 0.0017936 and similarly weight factors as reported in Table 24 are calculated.

Table 24
Weight factors

Criteria	Flow Distance	Adjacency Score	Flexibility	Accessibility	Maintenance	Human Issue
w_j	0.0017936	0.0005279	0.2443418	0.2483265	0.2420762	0.2629343

By considering these weighted factors, the weighted normalized decision matrix along with positive and negative ideal solutions A* and A' (calculated by using Equations 9 and 10) are summarized in Table 25.

$$A^* = \{v_1^*, \dots, v_n^*\}, \text{Where}, v_j^* = \{\max(v_{ij}) \text{ if } j \, \varepsilon \, J; \min(v_{ij}) \text{ if } j \, \varepsilon \, J'\} \tag{9}$$

$$A' = \{v_1', \dots, v_n'\} \quad \text{Where}, v' = \{\min(v_{ij}) \text{ if } j \, \varepsilon \, J; \max(v_{ij}) \text{ if } j \, \varepsilon \, J'\} \tag{10}$$

Table 25
Weighted normalized decision matrix with positive and negative ideal solution

Alternative	Flow Distance	Adjacency Score	Flexibility	Accessibility	Maintenance	Human Issue
A1	0.0007241	0.0002224	0.1954734	0.1907435	0.1851171	0.2017030
A2	0.0007422	0.0002163	0.1160624	0.1331606	0.1281580	0.1404717
A3	0.0007793	0.0002159	0.0767931	0.0719787	0.0711989	0.0756386
A4	0.0006920	0.0002224	0.0165803	0.0269920	0.0142398	0.0216110

A6	0.0008016	0.0002156	0.0279248	0.0341899	0.0284796	0.0360184
A*	0.0006576	0.0002224	0.1954734	0.1907435	0.1851171	0.2017030
A'	0.0008016	0.0001997	0.0165803	0.0161952	0.0142398	0.0180092

The separation from the positive ideal alternative is given by

$$S_i^* = [\Sigma(v_j^* - v_{ij})^2]^{\frac{1}{2}} \; i = 1, \dots, m \tag{11}$$

The separation from the negative ideal alternative is given by

$$S_i' = [\Sigma(v_j' - v_{ij})^2]^{\frac{1}{2}} \; i = 1, \dots., m \tag{12}$$

For alternative No.1, separation of positive ideal solution is equal to [(0.0007241 - 0.0006576) ^2 + (0.0002224 - 0.0002224) ^2 + (0.1954737- 1954734) ^2 + (0.1907435 - 0.1907435) ^2 + (0.1851171 - 0.1851171) ^2 + (0.2017030 - 0.2017030) ^2] ^0.5 = 0.0000844 and the entire results are shown in Table 26. Also, the relative closeness coefficient of each alternative is calculated by using Eq. (13).

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

$$C_i^* = S_i' / (S_i^* + S_i'), \quad 0 < C_i^* < 1 \tag{13}$$

For alternative No.1, (C_i^*) is equal to 0.3541389 / (0.0000844 + 0.3541389) = 0.9997618 and these results are also shown in Table 26.

Table 26
Separation measures of positive and negative ideal solutions, relative closeness and rank

Alternative	Separation measure of positive ideal solution (S_i^*)	Separation measure of negative ideal solution (S_i')	Relative closeness (C_i^*)	Rank
A1	0.0000844	0.3541389	0.9997618	1
A2	0.1288671	0.2270534	0.6379329	2
A3	0.2388398	0.1153409	0.3256555	3
A4	0.3470268	0.0113847	0.0317644	6
A5	0.3359901	0.0270407	0.0744859	5
A6	0.3233384	0.0313014	0.0882626	4

Larger relative closeness (C_i^*) value shows the optimum alternative for all the performance measures under consideration. So from Table 26, it is clear that alternative 1 is having maximum relative closeness value and hence is the optimum solution of TOPSIS coupled with entropy method.

5.2 WASPAS method coupled with Entropy method

WASPAS method is a unique combination Weighted Sum Method (WSM) and Weighted Product Method (WPM) and is useful to improve ranking accuracy. The application of WASPAS method (illustrated by Chakraborty & Zavadskas, 2014 for manufacturing decision making) is applied in this case as follows. For the initial decision matrix (Table 20), normalization of beneficial and non-beneficial criteria are done. For beneficial criteria,

$$r_{ij} = \frac{x_{ij}}{\max_i x_{ij}} \quad i = 1,2,\ldots,m \text{ and } j = 1,2,\ldots,n \tag{14}$$

For non-beneficial criteria,

$$r_{ij} = \frac{\min_i x_{ij}}{x_{ij}} \quad = 1,2,\ldots,m \text{ and } j = 1,2,\ldots,n \tag{15}$$

where x_{ij} and r_{ij} are the original and normalized values. Flow distance is non beneficial criteria and its minimum value is 739.07 which is for alternative No. 5. For example, the normalized value of alternative No. 1 is equal to 739.07/816.76 = 0.9048803. Similarly, normalized values for remaining performance measures and alternative are computed and listed in Table 27.

Table 27
Normalised decision matrix for WASPAS method

Alternative	Flow Distance	Adjacency Score	Flexibility	Accessibility	Maintenance	Human Issue
A1	0.9048803	1.0000000	1.0000000	1.0000000	1.0000000	1.0000000
A2	0.8859945	0.9724026	0.5937500	0.6981132	0.6923077	0.6964286
A3	0.8438702	0.9707792	0.3928571	0.3773585	0.3846154	0.3750000
A4	0.9503401	1.0000000	0.0848214	0.1415094	0.0769231	0.1071429
A5	1.0000 000	0.8977273	0.1696429	0.0849057	0.1923077	0.0892857
A6	0.8203867	0.9691558	0.1428571	0.1792453	0.1538462	0.1785714

The total relative importance of the i_{th} alternative based on WSM is calculated using Eq. (16).

$$Q_i^{(1)} = \sum_{j=1}^{n} r_{ij} w_j \tag{16}$$

where, w_j is weight of j_{th} criteria. As reported earlier, criteria weight (w_j) obtained by Entropy method is employed. By considering the weights calculated for entropy method (Table 24), normalised value of flow distance for alternative No.1 is 0.9048803 × 0.0017936 = 0.0016230 and performance score ($Q_i^{(1)}$) is equal to (0.0016230 + 0.0005279 + 0.2443418 +

0.2483265 + 0.2420762 + 0.2629343) = 0.9998297. Similarly for remaining alternatives weighted normalised decision matrix and performance scores are computed (Table 28).

Table 28
Weighted normalised decision matrix and performance score of WSM

Alternative	Flow Distance	Adjacency Score	Flexibility	Accessibility	Maintenance	Human Issue	$Q_i^{(1)}$
A1	0.0016230	0.0005279	0.2443418	0.2483265	0.2420762	0.2629343	0.9998297
A2	0.0015891	0.0005133	0.1450779	0.1733600	0.1675912	0.1831150	0.6712466
A3	0.0015136	0.0005125	0.0959914	0.0937081	0.0931062	0.0986004	0.3834322

A5	0.0017936	0.0004739	0.0414508	0.0210843	0.0465531	0.0234763	0.1348321
A6	0.0014714	0.0005116	0.0349060	0.0445114	0.0372425	0.0469526	0.1655954

The total relative importance of the i_{th} alternative based on WPM is calculated by using Eq. (17).

$$Q_i^{(2)} = \prod_{j=1}^{n} (r_{ij})^{w_j} \tag{17}$$

The weighted normalised value of flow distance for alternative No.1 is 0.9048803 ^ 0.0017936 = 0.9998207 and performance score ($Q_i^{(2)}$) is equal to (0.9998207 × 1.000000 × 1.000000 × 1.000000 × 1.000000 × 1.000000) = 0.9998207. Accordingly weighted normalised decision matrix values and performance scores are shown in Table 29.

Table 29
Weighted normalized decision matrix and Performance score of WPM

Alternative	Flow Distance	Adjacency Score	Flexibility	Accessibility	Maintenance	Human Issue	$Q_i^{(2)}$
A1	0.9998207	1.0000000	1.0000000	1.0000000	1.0000000	1.0000000	0.9998207
A2	0.9997829	0.9999852	0.8804038	0.9146241	0.9148296	0.9092574	0.6696547
A3	0.9996956	0.9999843	0.7958928	0.7850491	0.7934962	0.7726774	0.3829618
A4	0.9999086	1.0000000	0.5472542	0.6153433	0.5374534	0.5558327	0.1005893
A5	1.0000000	0.9999430	0.6482512	0.5420341	0.6709229	0.5298154	0.1248942
A6	0.9996450	0.9999835	0.6215946	0.6525462	0.6356426	0.6357344	0.1638498

A joint generalized equation for determining the total relative importance of criteria (Qi) is displayed in Eq. (18).

$$Q_i = 0.5Q_i^{(1)} + 0.5\,Q_i^{(2)} \tag{18}$$

For Alternative No.1, Q_i = (0.5 × 0.9998297) + (0.5 × 0.9998207) = 0.9998252. Table 30 summarizes values of total relative importance for all the alternatives.

Table 30
Total relative importance

Alternative	$Q_i^{(1)}$	$Q_i^{(2)}$	Q_i	Rank
A1	0.9998297	0.9998207	0.9998252	1
A2	0.6712466	0.6696547	0.6704507	2
A3	0.3834322	0.3829618	0.3831970	3
A4	0.1048912	0.1005893	0.1027402	6
A5	0.1348321	0.1248942	0.1298632	5
A6	0.1655954	0.1638498	0.1647226	4

According to Table 30, alternative 1 has the highest rank, so it gives the best multiple performance characteristics and is taken as optimum solution of WASPAS method. To increase ranking accuracy and effectiveness more generalized Eq. (19) is used. Total relative importance of i_{th} alternative is found by,

$$Q_i = \lambda Q_i^{(1)} + (1-\lambda)Q_i^{(2)} \tag{19}$$

where, λ = 0, 0.1……1. For example λ = 0.9, total relative importance (Qi) of alternative No.1 is equal to (0.9 × 0.9998297) + ((1 - 0.9) × 0.9998207) = 0.9998288. Similarly for remaining alternatives total relative importance for different values of λ is as shown in Table 31.

Table 31
Ranking of alternatives for different λ values

Alternative	λ = 0	λ = 0.1	λ = 0.2	λ = 0.3	λ = 0.4	λ = 0.5	λ = 0.6	λ = 0.7	λ = 0.8	λ = 0.9	λ = 1

A3	0.3829618	0.3830088	0.3830558	0.3831029	0.3831499	0.3831970	0.3832440	0.3832910	0.3833381	0.3833851	0.3834322
A4	0.1005893	0.1010195	0.1014497	0.1018799	0.1023101	0.1027402	0.1031704	0.1036006	0.1040308	0.1044610	0.1048912
A5	0.1248942	0.1258880	0.1268818	0.1278756	0.1288694	0.1298632	0.1308569	0.1318507	0.1328445	0.1338383	0.1348321
A6	0.1638498	0.1640243	0.1641989	0.1643735	0.1645480	0.1647226	0.1648972	0.1650717	0.1652463	0.1654209	0.1655954

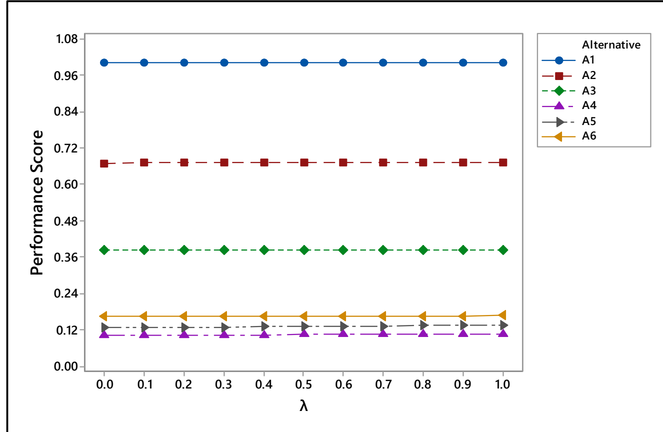

Fig. 12. Variation of performance scores for different λ values

Fig. 12 highlights the effect of the varying values of λ on the performance scores and ranking in WASPAS method. It is interesting to note that the ranking of all alternatives remains constant over the considered range of λ values.

6. Rank Reversal study

The objective of this section is to study the rank reversal in TOPSIS by numerical analysis. The effect of addition of an alternative on the ranking order is checked. There are six alternatives, each of which has six attributes. The initial and combination values for the alternatives and the ranking results are reported in Table 32. It is clear that, when alternative 4 i.e. layout having a lower rank is eliminated, then the ranking of the five old alternatives becomes A5 > A1 > A2 > A3 > A6. When the new alternative A7 is added to the previous six alternatives, the first rank does not change but remaining ranks get changed and it becomes A1 > A2 > A7 > A3 > A6 > A5 >A4. In the above two combinations, different rankings are obtained as compared to the original one. So vector normalization affects the independence between alternatives which disturbs the initial ranking. To overcome this, it is necessary to apply normalization method which maintain independence between alternatives by keeping the ideal solution constant. Considering the above condition, the Max-Min normalization method is used and the results are reported in Table 33.

Table 32
Initial and combination values by considering Vector normalization method

	Layout	Flow Distance /Cost-1	Adjacency Score	Flexibility	Accessibility	Maintenance	Human Issue	Rank

From Table 33, it is observed that the first rank remains unchanged for all cases which ensures good agreement in the decision results.

7. Conclusion

This paper addresses the real-life problem of the gearbox manufacturing industry. Six alternative layout designs are developed by using SLP, S flow pattern, U flow pattern, ALDEP, CRAFT, and CORELAP methods. For choosing the optimum configuration, we considered quantitative and qualitative performance measures. Quantitative performance is directly measured from layout design whereas AHP method is applied for getting the qualitative performance data. For layout designs, all the criteria do not have equal impact, therefore it is not possible to assign equal weights to these performance measures. For this purpose, for calculating the weights, the Entropy method is used. Subsequently, two MCDM approaches TOPSIS and WASPAS both coupled with the entropy method are considered for selection and comparison of the optimum layout design. The ranks of all the alternatives obtained by the TOPSIS method are the same as those obtained by the WASPAS method. Both MCDM approaches give SLP layout as optimum solution. In the case of the WASPAS method, the ranking of all alternatives remains unaffected for λ values which confirms the optimum solution developed by SLP. Also, rank reversal phenomenon is applied to TOPSIS and the causes of occurrence are reported. It has been observed that the Max-Min normalization method is stable and robust compared to the vector normalization method.

Kolhapur, Maharashtra, India.

Abstract—**This research paper presents the investigation on laser transformation hardening (LTH) of unalloyed titanium of 1.6mm thickness sheet, nearer to ASTM Grade 3 of chemical composition was investigated using 2KW CW Nd: YAG Laser. The effects of laser process parameters: laser power750-1250W), scanning speed (1000-3000 mm/min) and focal point position (-10mm to -30mm) on the hardened bead profile parameters such as hardened bead width (HBW) and hardened depth (HD) was investigated using Response Surface Methodology (RSM). The experimental design is based on an independent quadratic Box-Behnken Design (BBD) matrix. The reduced linear and quadratic polynomial equations for predicting hardened bead width and hardened depth of bead profile were developed. Adequacies of models were examined by Analysis of Variance (ANOVA) technique. The results designate that the mathematical models developed predict the responses adequately adequate within the limits of hardening parameters being employed. It is recommended that the regression equations can be used to find optimum laser hardening conditions for desired criterion.**

Keywords: **Laser transformation hardening; response surface methodology; full factorial design; analysis of variance; bead geometry.**

I. INTRODUCTION

Titanium is a very attractive material for aerospace applications due to its low thermal conductivity, relatively low density and elastic modulus, light weight, high strength to weight ratio and temperature capabilities; titanium is used in cryogenic applications as well as for elevated temperature applications up to ~600°C. Titanium and its alloys are of excellent corrosion resistance, wear resistance, and high specific strength (strength/density), titanium and its alloys have been extensively used for chemical, electric power, marine, biomedical, pharmaceutical and aerospace industries as major metal materials by taking advantage of their characteristics. On the other hand, their applications to automobile industry have been limited except for racing cars and special-purpose cars because of their high cost despite the strong interest shown in titanium materials by the industry in terms of lightweight, fuel efficiency and performances. A unique aspect of titanium is that even the modulus can be modified by heat treatment and/or processing. The laser surface transformation hardening was initially reported in the early seventies and that has become an established technology in manufacturing and processing industries to improve the surface characteristics of intricate and selected areas of various engineering components. This has been revolutionizing automobile and aerospace industries for hardening surface layers of the turbine blades, crankshafts, piston ring grooves and tractor engine components, etc. Laser hardening process gives a wear-resistant surface layer, thereby increasing the service life of components to a considerable extent. All cast iron, medium-carbon steel and tool steel are amenable to the laser hardening process [1].

Laser Surface Transformation Hardening (LSTH) fundamentally allows obtaining a hardened surface layer in titanium and its alloys by changing the base structure into hardened transformed beta marten site. Harden ability of titanium and its alloys is a phrase that refers to its ability to permit full transformation of the titanium and its alloys to transformed beta (marten sites, alpha) or to retain beta to room temperature. The standard laser transformation hardening (LTH) of titanium and its alloys involves two main steps: 1. beta phase formation, in which the material is heated to/above the beta transus temperature, i.e., β-transus (88 ˚C or 1621˚F), in order to form the material with 100% beta phase (but below the melting point) and 2. "self quenching" or cooling down, where β-phase is transformed into harder acicular (plate-like) α marten site (transformed β) or retain beta to room temperature. The β-transus is defined as the lowest equilibrium temperature at which the

material is 100% beta or alpha, which does not exist. The β-transus is critical in deformation processing and in heat treatment. A correct treatment requires the heating stage long enough for the β-phase formation to complete and allow the alloying elements such as manganese, carbon, oxygen and nitrogen to stabilize it and dissolve iron, vanadium, molybdenum, copper, nickel and silicon into the matrix. Self quenching should be fast enough so as to suppress the normal breakdown of β-phase into the initial α or (α+β) phases and produce hard plate like alpha marten site formation instead [2].

A high power laser beam can be delivered to the work piece with a very precise spatially and temporally control. For the localized laser heating, bulk of the work piece remains at a low temperature and acts as a heat sink and therefore, when laser irradiation is stopped, rapid self-quenching takes place. Compared to standard hardening procedures, the laser techniques offer several advantages. The applied laser radiation instantaneously heats a localized region on the surface and the bulk of the material acts as an efficient heat sink producing high cooling rates [3, 4]. This means that desired hardened depths can be achieved at high laser processing speeds and with minimal thermal distortion in the treated parts. In addition, it has been shown that laser surface hardening not only increase the wear and corrosion resistance but also increase the fatigue strength under certain conditions. [5, 6]. In this research, continuous wave 2kW, Nd: YAG laser source with radiation wavelength of 1.064 µm has been used to produce hardening of commercially pure titanium nearly ASTM Grade 3 of 1.6mm thickness sheet.

From the literature survey it has been observed that many authors have published their research work related to only laser welding, cladding, cutting, hardening processes specifically steel materials with full factorial design, Box–Behnken design, Plackett-Burman design, and Central Composite Design using RSM. Prachya Peasura studied the application of the Response Surface Methodology (RSM) and Central Composite Design (CCD) experiment in mathematical model and optimizes post weld heat treatment (PWHT). Author found the influence of PWHT and the most appropriate mathematical model as the basis for further ASTM A516 grade 70 weld applications using response surface methodology (RSM) to find the optimal parameters and the central composite design (CCD) experimental design for a mathematical model to predict the tensile strength [7].D. S. Badkar, et al. investigated the influence of laser phase transformation hardening parameters on heat input and hardened-bead profile quality of unalloyed titanium using Nd: YAG laser. The applied the response surface methodology (RSM) in order to develop the mathematical modeling of heat input and angle of entry of hardened bead geometry [1]. Duradundi Sawant Badkar et al. investigated and evaluated the optimal values of laser process parameters: laser power, scanning speed, and focused position for the simultaneous minimization and maximization of heat input and tensile strength respectively by Taguchi method and utility concept approach in laser transformation hardening of commercially pure titanium sheet of 1.6mm thickness using continuous wave (CW) Nd: YAG laser beam [8]. Duradundi Sawant Badkar employed a Full Factorial Design (FFD) with Response Surface Methodology(RSM)is to establish, optimize and to investigate the relationships of three laser transformation hardening process parameters: laser power, scanning speed, and focused position on laser hardened bead profile parameters such as angle of entry of hardened bead profile and power density. RSM is used to develop pseudo-closed-form models from the computational parametric studies. The results demonstrate that the developed models are accurate with low percentages of error [9]. Duradundi Sawant Badkar studied the effect of laser process variables such as laser power, scanning speed, and focused position was investigated using response surface methodology (RSM) and artificial neural network (ANN) keeping argon gas flow rate of 10 lpm as fixed input parameter. This paper describes the comparison of the heat input (HI) and ultimate tensile strength (σ) (simply called as tensile strength) predictive models based on ANN and RSM. The paper also presents the effect of laser process variables on the HI and ultimate σ. The research work also emphasizes on the effect of HI on σ. The experiments were conducted based on a three-factor, three-level Box-Behnken surface statistical design. Quadratic polynomial equations were developed for proper process parametric study for its optimal performance characteristics [10].

Duradundi Sawant Badkar et al. in their study applied the Response Surface Methodology (RSM) and Central Composite Design (CCD) for modeling, optimization, and an analysis of the influences of dominant laser-processing parameters namely: laser power (LP), scanning speed (SS), and focused position (FP) on heat input (HI) and hardened bead geometries such as hardened bead width (HBW), hardened depth (HD), angle of entry of hardened bead profile (AEHB) of laser transformation hardened surface quality of commercially pure titanium sheet of 1.6 mm in thickness using continuous wave (CW) 2-kW Nd:YAG laser. They showed the predicted results are compared with the experimental results and are good agreement with heat input and hardened bead profile parameters [11]. Duradundi Sawant Badkar et al. developed the mathematical models from Response Surface Methodology (RSM) are used to predict the laser phase transformation hardened bead profile parameters in terms of the laser process factors; namely laser power (LP), scanning speed (SS) and focused position (FP), used to optimize the laser transformation hardening process. It has been investigated that the results accomplished from both numerical optimization and graphical methods ensured almost analogous values to each other for optimal LTH conditions in all the cases [12].

Published Online May 2022 in IJEAST (http://www.ijeast.com)

In this research article author has made an effort in establishing the influence of laser process parameters on hardened bead geometry, and developing the mathematical models in order to optimize the laser process parameters thereby achieving the hardened bead geometry with maximum hardened bead width and minimum hardened depth.

II. EXPERIMENTAL DESIGN

The experimental design is based on a three level Box-Behnkin design with full replication [13]. Box-Behnkin designs are response surface designs specially made to require only 3 levels, codes as -1, 0, and +1. Table 1 shows laser input variables and experimental design levels used.

A response surface method (RSM) has been often applied to optimize the formulation variables [14, 15]. RSM designs allow us to estimate interaction and even quadratic effects, and hence give us an idea of the (local) shape of the response surface under investigation. The optimization procedure based on RSM includes statistical experimental designs, multiple regression analysis, and mathematical optimization algorithms for seeking the best formulation under a set of constrained equations. RSM was applied to the experimental data using statistical software, Design-expert 7. Linear and second order polynomials were fitted to the experimental data to obtain the regression equations. The sequential F-test, lack-of –fit test and other adequacy measures were used in selecting the best models. A step-wise regression method was used to fit the second order polynomial equation (1) to the experimental data and to indentify the relevant model terms [16, 17]. The same statistical software was used to generate the statistical and response plots. The second-order model is utilized to find a suitable approximation for the functional relationship between independent variables and the response surface.

$$Y = \beta_0 + \sum_{i=1}^{k} \beta_i X_i + \sum_{i=1}^{k} \beta_{ii} X_{ii} + \sum_{i=1} \sum_{j=i+1} \beta_{ij} X_i X_j + \varepsilon \quad (1)$$

where Y is the response calculated by model (dependent variables), β_0 is the constant coefficient, β_i are the coefficients for the linear effect, β_{ii} are the coefficients for the quadratic effect, β_{ij} are the coefficients for the cross-product effect, Xij, Xj are the variables corresponding to factors (independent variables), ε is the error, k the number of variables considered and i, j are the factors.

III. EXPERIMENTAL METHODOLOGY

The experiments are conducted on a given unalloyed Titanium alloy substrate with chemical composition given in Table 2. The chemistry is nearer to ASTM Gr. 3. The thickness of the substrate selected is 1.6 mm, to simulate the majority of the industrial applications that is in practice at present. For conducting the experiments on the substrate, the materials surface is cleaned properly with suitable agents.

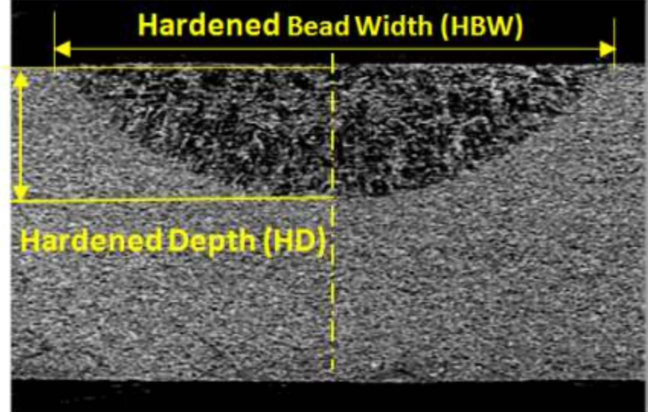

Figure. 3. Microstructure of Hardened - Bead Profile with parameters, HBW, HD and AEHB

A continuous wave (CW) 2KW, with radiation wavelength λ=1.06µm Nd: YAG laser source from GSI Lumonics is employed for the experimental work as shown in Fig.1. The experiment was carried out according to the design matrix in a random order to avoid any systematic error. A spherical beam configuration is used throughout for the study. The experiment set up is shown in Fig.2. The laser beam is transported through a fibre optic cable to the work centre. Siemens 802 CNC controller is providing the process control during the experiments. The work centre is having x, y and rotational movement for processing applications. The laser source, work centre and the controls are interfaced. Cooling is ensured by a chiller and a cooling tower. For the study, 120mm focal optic is employed with varying beam spot size depending on defocus distance to obtain a wider scan area. Argon gas is employed as shielding medium with a constant flow rate of 8lpm throughout the experimental work. Transverse sectioned specimens were cut from laser hardened bead-on trial of unalloyed titanium sheet and mounted. Standard metallographic was made for each transverse sectioned specimens. The bead profile parameters 'responses' were measured using an optical microscope (with Image processing computer controlled software) with digital micrometers attached to it with an accuracy of 0.001 mm, which allow to measure in x-axes and y-axes directional movement.

Fig.3 shows microstructure of laser Hardened-Bead Profile with measured parameters, such as hardened bead width (HBW), hardened depth (HD) and angle of entry of hardened bead profile(AEHB) for CW spherical beam. The measured laser hardened bead profile parameters 'responses' were recorded. The design matrix is shown in Tables 3.

IV. RESULTS AND DISCUSSION

The results of the laser hardened-bead on trials were measured according to the design matrix with coded and actual independent process variables in Table 3 using the transverse sectioned specimens and the optical microscope mentioned earlier, the measured responses are listed in Table 4. Analyzing the measured responses by the Design-expert software, the fit summary output indicates that the linear model is significantly significant for hardened bead width (HBW) 'the second response' therefore it will be used for further analysis. While for the other response hardened depth (HD) the quadratic models is statistically and is recommended for the further analysis.

A. Analysis of variance (ANOVA)

The adequacy of the developed models were tested using the analysis of variance (ANOVA) technique and the results of the linear and quadratic order response surface model fitting in the form of analysis of variance(ANOVA) are given in Tables 4-5. The test for significance of the regression models, the test for significance on individual model coefficients and the lack-of-fit test were performed using the same statistical Design-expert 7 software package. By selecting the step-wise regression method, which eliminates the insignificant model terms automatically, the resulting ANOVA Tables 4-5 for the response surface quadratic models summarize the analysis of variance of each response and show the significant model terms.

The same Tables show also the other adequacy measures R^2, adjusted R^2 and predicted R^2.The coefficient of determination R^2 indicates the goodness of fit for the model. In this case, all the values of coefficient of determination R^2 are nearly equal to 1. Clearly, we must have $0 \leq R^2 \leq 1$, with larger values being more desirable. The adjusted coefficient of determination R^2 or "adjusted" R^2 is a variation of the ordinary R^2 statistic that reflects the number of factors in the model. The entire adequacy measures are closer to 1, which is in reasonable agreement and indicate adequate models. The adequate precision "Adeq Precision" compares the range of the predicted value at the design points to the average prediction error. Adequate precision measures signal to nose ratio. A ratio greater than 4 is desirable. In all cases the value of adequate precision are dramatically

Vol. 7, Issue 1, ISSN No. 2455-2143, Pages 153-165
Published Online May 2022 in IJEAST (http://www.ijeast.com)

greater than 4. The adequate precision ratio above 4 indicates adequate model discrimination. The ANOVA Tables 5-6 also shows the model terms standard Std. Dev, Mean, C.V and PRESS. "Std. Dev." Standard deviation is a square root of the error mean square, ($\sqrt{MS_E}$) and "C.V." is the coefficient of variation, defined ($\sqrt{MS_E}/\bar{y}$) 100, where $\bar{y}$ = Mean. The coefficient of variation, "C.V" measures the unexplained or residual variability in the data as a percentage of the mean of the response variable. At the same time a relatively lower values of the coefficient of variation, C.V., from the Tables 4-5 indicate improved precision and reliability of the conducted experiments. "PRESS" stands for "Prediction Error Sum of Squares," and it is a measure of how well the model for the experiment is likely to predict the responses in a new experiment. Small values of PRESS are desirable. In all the cases the values of PRESS are considerably small. The values of "Probability > F" in Tables 4-5 for all models are less than 0.0500 indicate that all models are significant. In all cases the "Lack-of-fit" values implies the "Lack-of-fit" is not significant relative to the pure error. Non-significant lack- of- fit as it is desired and it is good.

The analysis of variance for the hardened bead width (HBW) model, from the Table 4 the analysis indicated that there is a linear relationship between the main effects of the three process parameters. Also, in the case of hardened depth (HD) model, from the Table 5 the main effect of laser power (LP), scanning speed (SS), focused position (FP), interaction effect of laser power (LP) with scanning speed (SS) and the second order effect of scanning speed (SS) have the significant effect.

		HD (mm)	0.724	0.758	-0.034	-4.690
3	LP=1250Watts SS=3000mm/min FP=-30mm	HBW (mm)	2.274	2.368	-0.094	-4.130
		HD (mm)	0.440	0.469	-0.029	-6.590
4	LP=1000Watts SS=1000mm/min FP=-20mm	HBW (mm)	2.519	2.503	0.001	0.630
		HD (mm)	1.043	0.969	0.074	7.090
5	LP=750Watts SS=1000mm/min FP=-30mm	HBW (mm)	2.274	2.292	-0.018	-0.791
		HD (mm)	0.716	0.684	0.032	4.470

The final mathematical models in terms of coded factors/variables as determined by design expert software are shown below:

Hardened bead width (HBW) = $2.2522 + 0.2894\times LP - 0.251\times SS - 0.078\times FP$ (2)

Hardened depth (HD) = $0.5884 + 0.1698 \times LP - 0.2776\times SS + 0.0452\times FP - 0.0697\times LP\times SS + 0.1032\times SS^2$ (3)

While the following final empirical models in terms of actual factors/variables:

Hardened bead width (HBW) = $1.441+0.00116\times LP-0.0002511\times SS-0.0078\times FP$ (4)

Hardened depth (HD) = $0.40941+0.00123\times LP-0.00041\times SS+0.00452\times FP-2.79E\text{-}07\times LP\times SS+1.032E\text{-}07\times SS^2$ (5)

The above obtained mathematical models in terms of coded factors/variables (equation. 2 & equation. 3) are related to the coded laser process parameters and empirical models in terms of actual factors/variables (equation. 4 & equation.5) are related to the actual (experimental) values of laser process parameters. By substituting the related values of coded variables and corresponding equivalent values of actual (experimental) variables of laser processing parameters in the mathematical models in terms of coded factors and empirical models in terms of actual factors the corresponding output values of HBW and HD will be almost similar for the developed models of coded and actual factors/variables.

B. Validation of the Models

Figs.4-5 show the relationship between the actual and predicted values of hardened bead width (HBW) and hardened depth (HD) of hardened bead profile respectively. These Figures indicate that the developed models are adequate because the residuals in prediction of each response are minimum, since the residuals tend to be close to the diagonal line. Furthermore, to verify the adequacy of the developed models, five confirmation experiments were carried out using new test conditions, but are within the experimental range defined early. Using the point prediction option in the software, the HI and HBW of the validation experiments were predicted using the previous developed models. Table 6 summarizes the experiments condition, the actual experimental values, the predicted values, error and the percentages of error.

C. Effect of Process Factors on Hardened-Bead Parameters

C.1. Hardened bead width (HBW)

Figs 6-11 show the effect of process parameters on the hardened bead width (HBW). From the results it is clear that the two parameters laser power (LP) and scanning speed (SS) are significantly affecting the hardened bead width (HBW) as compared to focused position (FP). From the Figs. 6 and 7, it is evident that the hardened bead width linearly increases with increasing LP and decreasing SS. At lower beam travel speed the time available for the laser beam to direct contact with the surface is more and hence hardened bead width increases. Therefore the heat input decreases leading to the less volume of the base being melted, consequently the width of the hardened zone decreases. From the Figs. 8 and 9 it is clear that as LP increases and FP decreases the hardened bead width (HBW) increases Moreover, increase in defocused beam, or decrease in focused position i.e. from -10 mm, -20 mm, and -30 mm respectively means wide laser beam results in spreading the laser power onto wide area. Therefore, wide area of the base metal will melt leading to an increase in HBW or vise-versa. From the Figs. 10 and 11 it is observed that as the SS decreases and the FP decreases (i.e. from -10 mm to -30 mm) the hardened bead width increases.

The results show also that laser power (LP) plays very important role in the hardened bead dimensions. An increase in LP results in increase the HBW, because of increase in the power density.

C.2. Hardened depth (HD)

From the results it is studied that the parameters those significantly affecting the hardened depth are LP and SS. Effect of focused position on hardened depth is significant bur it has less influence as compared to LP and SS. These effects are due to following reasons: the increase in LP leads to an increase in the heat input, therefore, more molten metal and consequently more HD will be achieved. However, the idea is reversed in case of SS effect, because the SS matches an opposite with heat input (HI). From the Figs 12 and 13 it is seen that HD increases as LP increases and SS decreases. It is very important to note that in case of laser transformation hardening process main aim is to harden the surface with desired optimum depth. As much as possible instead of focusing the beam it is convenient to have defocused beam with negative focal length (i.e. from -10 mm,-20 mm and -30 mm), hence there is no loss of heat energy of laser beam above the focal point, since the laser beam is of converging type. Therefore laser heat input with minimum loss will be converged and concentrated on a specified localized area with desired hardened bead width and depth without spreading of laser power is achieved. Below the focal point or focused beam, the laser beam is of divergent type, results in spreading of laser power with maximum loss of heat input energy. Using a focused beam results in increasing the power density, which mean the heat will localize in small portion results in increasing in power density leading to better hardened bead width and depth which is desirable for laser transformation hardening (LTH). Therefore, due to the above reasons mentioned, it may be noted that to achieve the desired optimum hardened width and depth it is most convenient to have defocused laser beam with negative focused position (i.e. above the focal point) for example -10 mm, -20 mm and -30 mm.

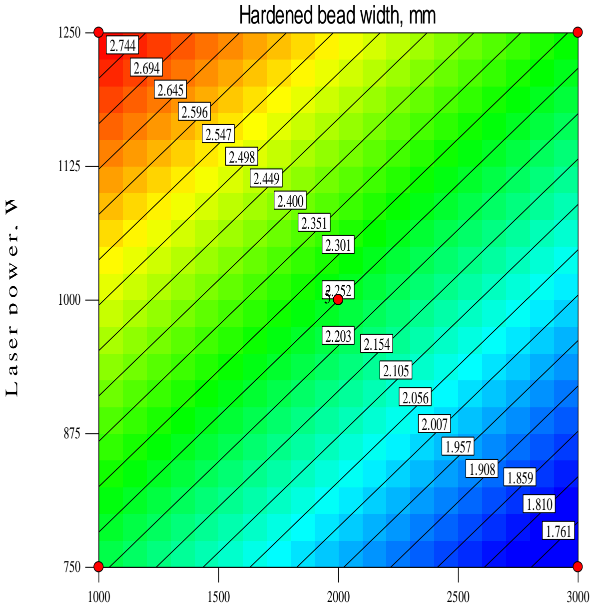

Figure 7. Contours graph shows the effect of LP and SS on the hardened bead width

From the Figs. 12 and 13 it is clear that hardened depth (HD) increases with increase in LP and decrease in SS. From the Figs.14 and 15, as LP decreases and defocusing increases (i.e FP from -10 to -30 mm) the HD decreases. It is also observed from the Figs.16 and 17, it is evident that as SS increases, hardened depth (HD) decreases considerably and as FP increases hardened depth (HD) decreases marginally. From the results obtained in Table 4 and from Figs.12-17, it is important to note that there is no large variation in the data of hardened depth (HD). Referring the Table 4 the range of HD lies between 0.293-1.191 mm and is of 0.898 mm variation only.

V. CONCLUSIONS

The following conclusions were drawn from this investigation within the factors limits considered. This paper has described the use of Design of Experiments (DoE) for conducting the experiments. Four models were developed

for predicting the heat input (HI), hardened bead width (HBW), hardened depth(HD), and angle of entry of hardened bead profile (AEHB) of the laser transformation hardened unalloyed titanium using response surface methodology(RSM). The following conclusions were drawn from this investigation within the factors limits considered.

1. Box-Behnken design can be employed to develop mathematical models for predicting laser hardened-bead geometry.
2. The desired hardened depth and width with high quality of laser transformation hardening (LTH) can be achieved by choosing the working condition using the developed models.
3. It is investigated that, in case of laser transformation hardening (LTH) though, as scanning speed increases depth of hardening decreases and vice-versa, but we are concentrating on desired optimum minimum depth. Therefore, both scanning speed and laser power have positive effect on all the responses investigated.
4. Bead width as well as depth of hardening linearly decreases with increasing scanning speed.
5. It is evident that the bead geometry provides a useful tool to manipulate the hardened bead width and hardened depth during LTH. It is clearly observed that the hardened width linearly increases defocused beam i.e. with higher beam spot size. Depth of hardened surface increases linearly with decrease in defocused position from -30 mm to -10 mm.

Abstract – *Reducing Weight is main problem in automobile industries. Since, if the vehicle weight is more the consumption of fuel is also more. And also if vehicle weight rises the cost also rises which indeed a main problem while buying an vehicle. The objective of the present work is to design and analyze the crankshaft with the material it is manufactured and also for the other metal alloys viz., EN9, SG700/2, SAE-1137.The solid model of the crankshaft was created in Solid Works. Model was imported in Altair Hyperworks for analysis by applying the normal load conditions. The model was tested for stress and deformation as the design constraints and also its frequency by performing modal analysis. After analysis a comparison is made between results of above materials mentioned in terms of deflections, stresses and frequency, to choose the best one.*

Key Words: **Crankshaft, EN9, SG700/2, SAE-1137, Solid Works, Hyperwork.**

1.INTRODUCTION

The main work of the crankshaft is to transform the translational mechanical work of the piston being carried forward and backward by the pneumatic work due to pressure change as a outcome of the combustion response. Crankshafts are mass volume manufacturing engine part and they are widely used in automobile engine. In an internal combustion engine, the pistons linear reciprocating motion is transformed into rotary motion using the crankshaft. There are lots of further uses of a crankshaft which covers from tiny single cylinder engines to big size multi cylinder marine crankshafts. The part connects the piston to the crankshaft via the connector pin used for the transfer of this energy; the connector pin energy to the tiny part of crankshaft axel that is offset comes from the main axis results in the rotation about the primary crankshaft axis. The crankshaft is also attached to the pull-start by the pull-start connection cup. When the pull-start chord is pulled, the energy is transferred to rotational energy of the crankshaft.

The crankshaft has transform the translational mechanical work of the piston to rotational mechanical work, its upcoming function is to convert this work to the driver pulley of the pulley-belt system. This is a important transfer of work due to its belt-pulley system that eventually replace this rotational mechanical work to the auger, causing it to rotate and collect the snow and additional material that is added by the auger. The movement that is related with the crankshaft is just this energy conversion. The crankshaft is located directly adjacent to the two-cycle gas engine, since it is attached to the piston by the connector pin.[5] This location further to the engine is a hot atmosphere that is caused by the convection of thermal energy off of the engine block's heat sink. The high temperatures in this atmosphere are cause for consideration when select the material for the crankshaft, which will be considered in the following section, with the help of geometry and appearance of the component.

2. GEOMETRIC MODELLING

To carry out CAE analysis of any component, the solid model of the same is essential. It is also called body in white. The CAD diagram shown in Fig. 1

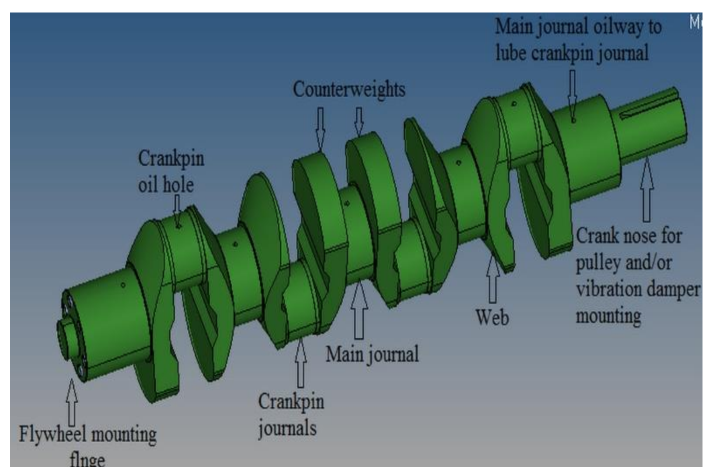

Figure 1- Crankshaft

2.1 MESHING

The creation of the FE-model initiates by importing the CAD model of the crankshaft from SOLID WORK to

DIRECTOR
Yashoda Technical Campus
Satara

Hypermesh. The assembled SOLID WORK model is exported to Hypermesh in .igs format. Meshing of CAD model is done by using solid elements. Whole crankshaft is meshed using solid element tetra4 with an average element size of 5mm.

Each node has displacement components and rotational degrees of freedom. Quality checks are made in order to eliminate coincident nodes and coincident elements. A standard mesh sensitivity analysis is carried out in order to confirm that the results achieved are effectively not altering to the size of the elements used. Figure 2 shows the complete meshed model of crankshaft.

2.2 MATERIALS AND PROPERTIES

Material properties need to be selected from standard material handbook. Most of the crankshafts are generally made of steel. Also the different materials with different compositions can be used for crankshafts which are shown in below table 2.

Table 2: Materials and properties

Material Description	Young's Modulus (E) MPa	Yield Strength (s) MPa	Poisson's ratio	Density ton/mm3
EN9	2.06e5	355	0.28	7.89e-9
SG700/2	1.72e5	471	0.28	7.15e-9
SAE-1137	2e5	435	0.285	7.8e-9

2.3 BOUNDARY CONDITIONS

The boundary condition is the applying of a load and/or constraint. In Hypermesh, boundary conditions are saved within a collector called load collectors. The function of the boundary conditions is to create and define constraints and loads on finite element models.

Constrained positions are showed in below figure 8.2.The load application is the major part in the analysis of a component. There are several kinds of loads like Point Load, Uniformly Varying Load and Uniformly Distributed Load.

The present crankshaft carries the UDL throughout its crankpin length. Where the total applied load is 39485.92N which is distributed along the length of the crankpin as well as the crankshaft is constrained at the both ends. Length of the pin is 40 mm. The total load and constrained applied on the crankshaft is as shown in below figure 3.

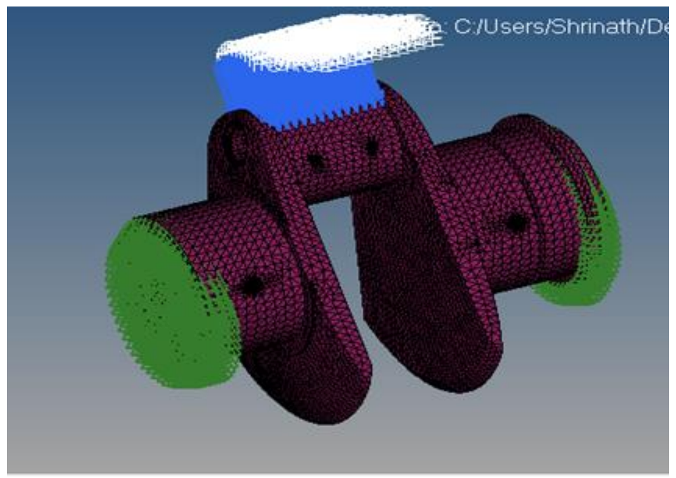

Figure 3: Boundary conditions.

3. SIMULATION AND RESULTS

Simulation is the processes of product validation were the product is tested with defined boundary conditions and assumed parameters. The process of simulating anything starts with model development; this model indicates the main function, characteristics or behaviors of the chosen physical process. The model represents the system itself, whereas the simulation represents the operation of the system over time.

In this paper we are taken a crankshaft and by changing its material properties the simulations are carried out. And finally the results of the simulations were compared.

3.1 EN9

For EN9 material, static analysis results are maximum displacement is 0.02128mm and maximum von-misses stress is 146.7Mpa. For free-free modal analysis frequency is 8378.6Hz and for constrained frame frequency is 6281.8Hz. The result images are shown in figure 4, 5, 6 and 7.

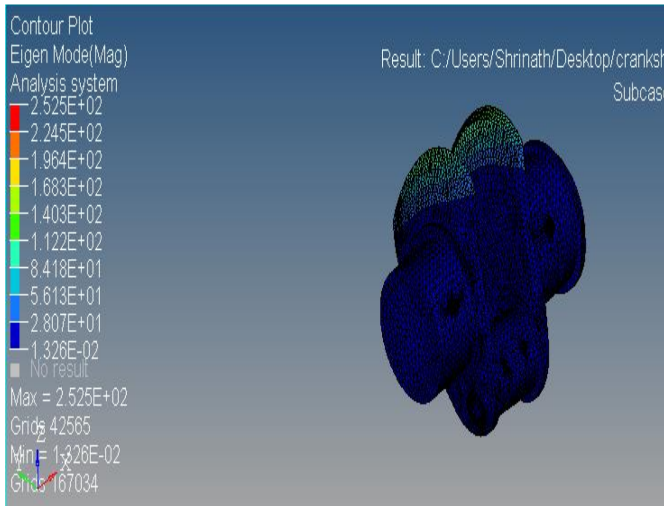

Figure 4: Free-Free Modal Analysis For EN9

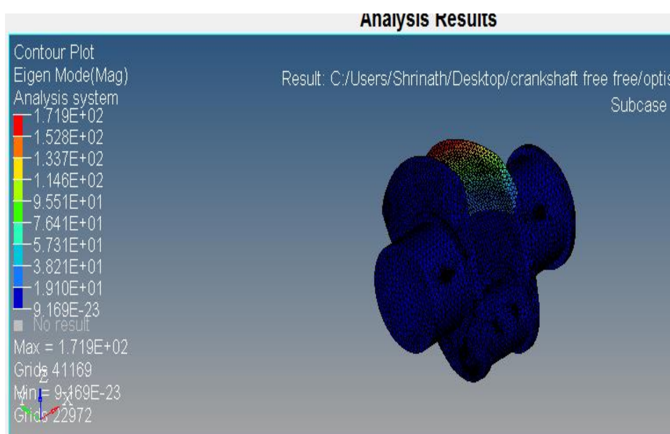

Figure 5: Constrained Modal Analysis For EN9

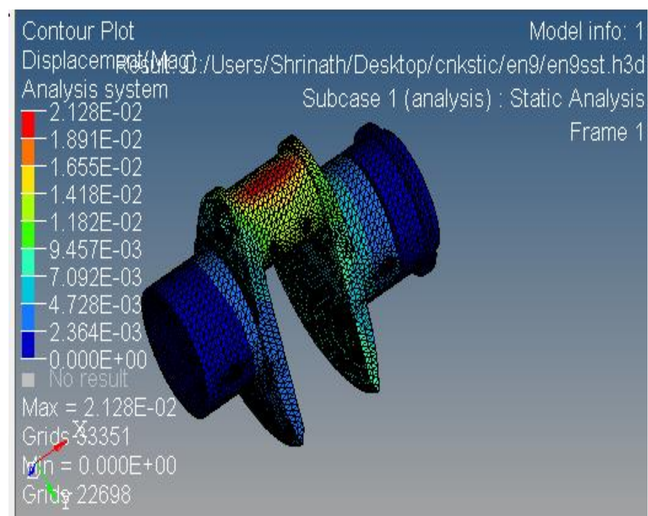

Figure 6: Displacement For EN9

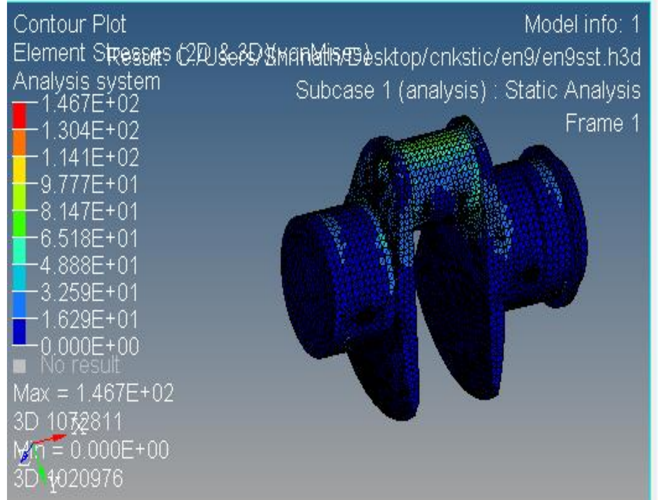

Figure 7: Von-Misses Stress For EN9

3.2 SAE-1137

For SAE-1137, static analysis results are maximum displacement is 0.02188mm And maximum von-misses stress is 146.1Mpa.For free-free modal analysis frequency is 8321.3Hzand for constrained frame frequency is 6239.4Hz. The result images are shown in figure 8,9,10 and 11.

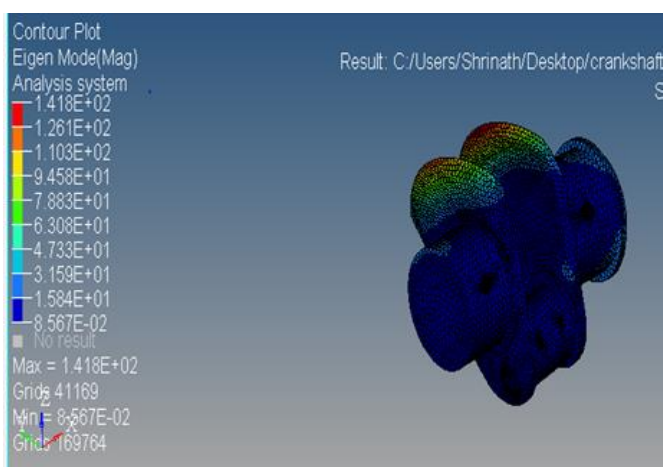

Figure 8: Free-Free Modal Analysis For SAE-1137

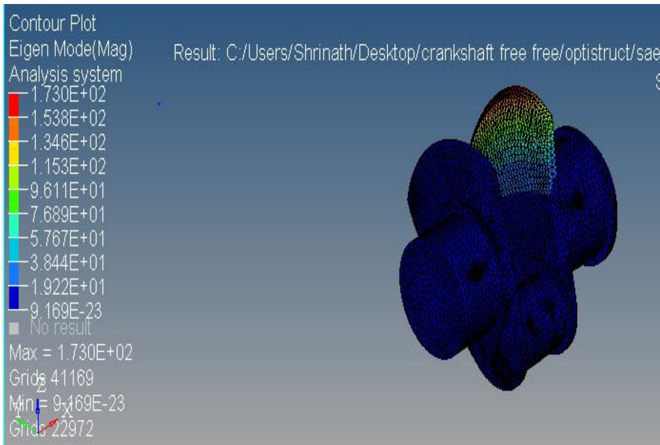

Figure 9: Constrained Modal Analysis For SAE-1137

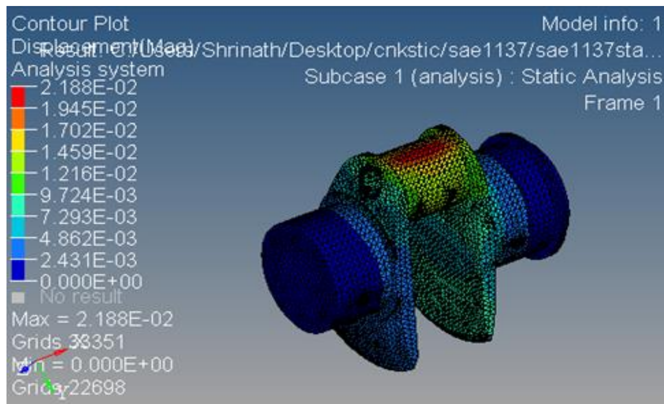

Figure 10: Displacement SAE-1137

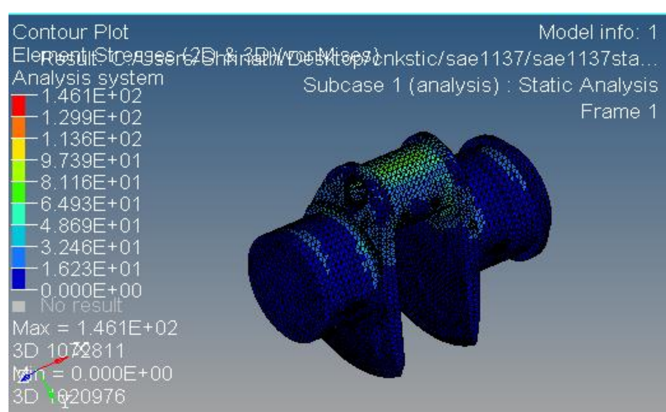

Figure 11: Von-Misses Stress SAE-1137

3.3 SG700/2

For Low alloy steel SG700/2, static analysis results are maximum displacement is 0.0254mm and maximum von-misses stress is 146.7Mpa. For free-free modal analysis frequency is 8023.7Hz and for constrained frame frequency is 6014.6Hz. The result images are shown in figure 12, 13, 14, and 15.

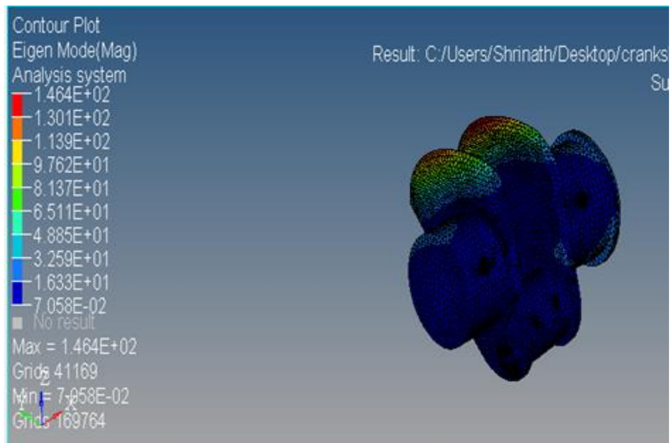

Figure 12: Free-Free Modal Analysis For SG700/2

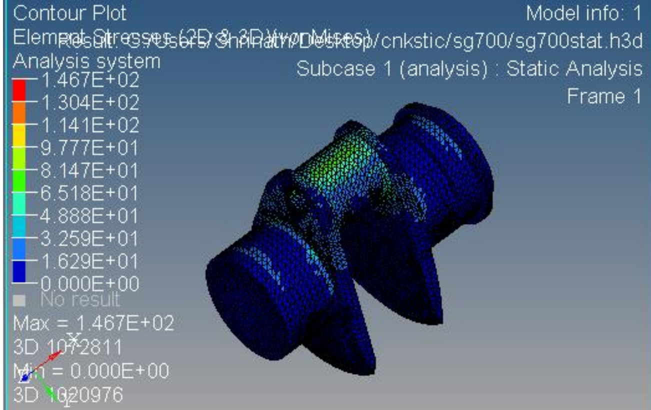

Figure 15: Von-Misses Stress For SG700/2

4. SUMMARY OF RESULTS

In this section we will discuss and compare the results of above simulations. The table 8.1 shows the summary of simulation results. The table shows the comparison between the simulation results of ladder chassis frame with different materials.

Table 3: Summary of Results

Materials	Static Analysis		Modal Analysis		Weight (kg)	Price (INR/kg)
	Displacement (mm)	Stress (MPa)	Free-free Frequency (Hz)	Constrained Frequency (Hz)		
EN9	0.02128	146.7	8378.6	6281.8	2.826	
SG700/2	0.0254	146.7	8023.6	6014.6	2.5609	43.15
SAE-1137	0.02188	146.1	8321.3	6239.4	2.794	47.45

5. CONCLUSIONS

In this project work, simulation is carried out on crankshaft with different materials. Here Altair Hypermeshv11.0 tool is used for meshing the complete model and passed the quality criteria's such as Quality Index, Skewness, Warpage, Jacobian etc. The FE model is successfully analyzed using RADIOSS and OPTISTRUCT software. After completing the simulations displacement, stress and frequency results are compared. From the comparison of simulation results we can concluded that:

1. The displacement is less i.e. 0.02128mm in EN9 material compared to other materials.
2. The von misses stresses are found almost same in all the three materials (EN9, SG700/2, SAE-1137) i.e. 146.7MPa under given boundary conditions.
3. The crankshaft made of SG700/2 material has less weight of 2.5609kg compared to other materials analyzed.
4. 10% weight reduction is observed by using SG700/2 with respect to EN9.
5. As compared to the cost of the SG700/2 is having the lower with compared to other material.
6. The frequency seen for material SG700/2 in free-free analysis is 8023.6Hz which is relatively lower and comparable with other materials.
7. The frequency seen for material SG700/2 in constrained analysis is 6014.6Hz which is relatively lower and comparable with other materials.
8. The percentage of weight reduction is 10% in single cylinder engines where as it would be even lower for four cylinder engine crankshaft.

ACKNOWLEDGEMENT

It gives us an immense pleasure to write an acknowledgement to this Paper, a contribution of all people who helped us realize it.

We take this opportunity to express our respectful regards to our beloved Principal **Dr. D. S. BADKAR** for motivate us to publish this paper.

Also we express our deep sense of gratitude and appreciation to our beloved H.O.D. **Prof. K. S. PATHADE** for this enthusiastic inspiration and amicable in all phases of our Paper.

Design and Implementation of Track Following & Obstacles Avoiding Robotics System Based on Programmable Technique

Asif Mohammad Shikalgar,Suraj Shankar Patil ,Pallavi Machindra Pawar,Pooja Khashaba Mane, Sonali Sunil More, Neha Sunil Kshirsagar

Dept. of Electronics & Tele-communication Enginnering, YSPM's YTC SATARA ,India

Abstract

Line following robot detects a visual line on a smooth surface area embedded on the floor and follows it. The path line is predefined and visible with a black line on the white surface area or the opposite. A line follower robot is designed, developed and implemented on a path of black on white or white on black using IR sensor and ultrasonic for object detector. The Arduino coding is developed on using C programming and tested and verified. The proposed system can be implemented on any commercial, industrial, medical and also in educational labs.

Keywords: Line follower, Obstacle detection, IR sensor and Ultrasonic sensor.

1 Introduction

The line following robot is the self-operating intelligent machine that follows a drawn line on a floor area and the path line can be visible as black on a white surface area; or a white line on the black surface area. It is an autonomous robot which identify and tracks either on a black line in white surface area or a white line in black surface area. Line following robot must be able to detect a specified line and maintain track on it and do the assign jobs. For performing job, the given path line must be followed by the designed and developed robot for special situations. The developed system composed of input, process and output parts. First read the black/white or white/black path on considered floor and take input signal for transmission into microcontroller (Arduino UNO) in a process that can be asked and made the decisions. Microcontroller decided based on the received inputs that can change (if needed) to be made directions or speeds of the robot. It converts the result to any directions which can be sent to the line follower speed. The system sends the first or previous adjusted control signals to speed and directions of line follower robot.

To design a line follower an ultrasonic sensor is needed, which is a device that can measure distance to an object by using sound waves. It computes the distance between the object and the line follower by sending a sound wave at a specific frequency and listening for that sound wave to bounce back. It is important to understand that some objects might not be detect by ultrasonic sensor. This can be applied for military purposes, delivery services, transportation systems, blind assistive applications. Finally, there are many annual line follower robot's competitions organized by universities or industries around the world.

2 LINE FOLLOWING PRINCIPLE

Here in this line follower robot we are using two IR sensor modules left sensor and right sensor. When both left and right sensor senses white then robot move forward (Fig. 1.1). If left sensor comes on black line, then the robot turns left side in the black line. (Fig. 1.2). If right sensor sense black line, then the robot turn right side until both sensors at white surface. When white surface comes robot starts moving on forward again (Fig. 1.3). If both sensors come on black line, robot stops (Fig. 1.4).

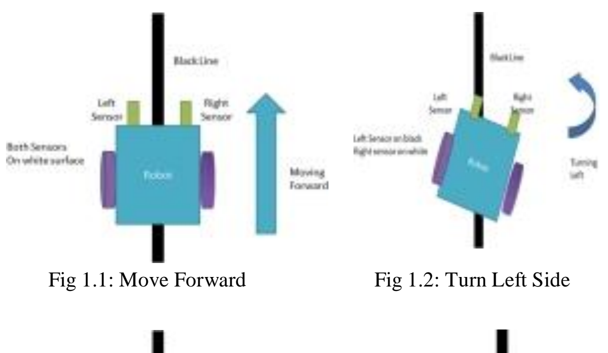

Fig 1.1: Move Forward

Fig 1.2: Turn Left Side

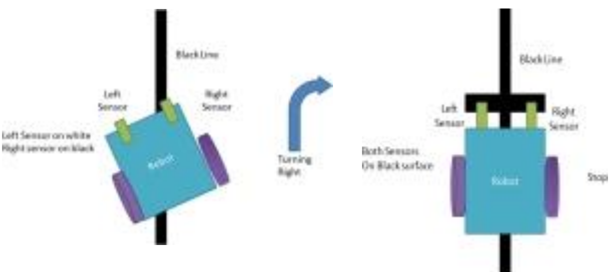

Fig 1.3: Turn Right Side

Fig 1.4: Stop

Fig. 1: Principle of Line Follower

3 PATHS OF LINE FOLLOWER

Line follower robot follows path drawn on the floor. The line will be mainly black on a white surface. If it occurs any line break on its way, the robot will go forward. If it finds a cross line, the robot will stop. Lines and robot movements can be changed by using programming code easily. Some lines are that the robot can follow:

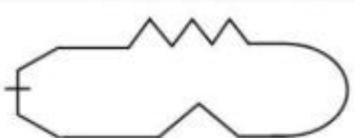

Fig. 2: Sample Path

The robot will follow a bad angle of 45° and cycle or bad curves. It will stop when it finds a cross black line.

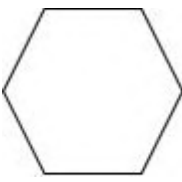

Fig. 3: Polygon Shape Path

On any kind of polygon, it can follow the line and maintain a particular speed.

Fig. 4: Cycle and Hard Curve

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

The line may have cycles and unwanted curves that it has to follow on narrow space or moving one room to another.

4 EXPERIMENTAL EQUIPMENT

The proposed robot is made of several components and they are: Arduino Uno R3, Arduino IDE, Ultrasonic Sensor (HC-SR04), Sonar Sensor Base, Digital IR sensor array, Motor Driver (L298N), Battery (900mAh), Two DC motors with Chassis Board, Mini Bread Board and Jumper Wires and are presented in Fig. 5.

```

6.APPLICATIONS

There are some identified application of the designed line follower robot and they are presented below:

(a)It can be used to deliver mail within an office building, industrial floor, medical ward and any robotics lab for education.

(b)It can be any mass transit system either bus stations of any airports.

(c)Line follower robots can be applied in military spy kids moving activities.

7.CONCLUSION

A line following robot is designed, developed and implemented that does not need any remote controller, Bluetooth, Wi-Fi, GSM, etc. This will run automatically with following a given line using Arduino microcontroller. This line follower robot is low cost but very effective for various purposes.

6757 SATARA DIRECTOR Yashoda Technical Campus Satara

This approach can be applied in different sectors like an office building, industrial floor, medical ward and any robotics lab for education purposes.

Fingerprint and IOT Based Exam Hall Authentication

[1]*Omkar Nikam,*[2]*Indrayani Kashid,*[3]*Ankita Bhosale,*[4]*Pooja Phadtare,*[5]*Komal Kale*

[1,2,3,4,5]*Department of Electronics and Telecommunication Engineering, Yashoda Technical Campus Wadhe,Satara,India*

Abstract

Security is crucial all around. Access into institutions, examination centers, organizations or even estates ought to be controlled and closely monitored through a verification system. The method of authenticating a student for an examination has an obvious problem such as presentation of fake clearance card, impersonation and so on and the unethical manner associated with the examination is a grim issue that requires the stakeholders in academic area to seek for alternative means of authenticating student for examination, because the manual paper-based clearance process is fundamentally flawed. Sequel to that, a dependable and effective system is designed to tackle the issues of the convectional technique. The system will verify the understudy using fingerprint biometrics technique and generate a report which can serve as an attendance.Multi biometric is an authentication technology using different biometric technology such as fingerprint, facial features and, vein pattern. The process for allowing student to sit for an examination in most universities has been through the presentation of medium of identification such as ID cards,, fees clearance card, photo cards, etc.

Keywords-Fingerprint Sensor, IOT module, authentication, Impersation.

1 INTRODUCTION

All academic institution have certain criteria for admitting students into examination hall. Hence accurate record of attendance and fees payments is necessary. To verify identity of person it is very critical and important task in society. Cash terminals, access control, examination pass identity; internet transactions are the basic examples of security issues where the identities of the users are important and useful.

Most of the universities adopted paper means authentication for eligibility of students for examination. This is issued by the university's examination and record units.

This contains vital information needed in identifying candidates. These may include the student's name, passport photographs and school's authentication stamps. This is known as 'examination pass'. It is the method devised by the institution's authorities in identifying eligible candidates for various examinations.

It is note that with the level of information provided, they still open to student as some of information displayed. By this pass can still be tampered with for the sole purpose of impersonations and other examination fraud as the case may be. Some of students get duplicate pass of examination hall that leads to cheating or fraud.

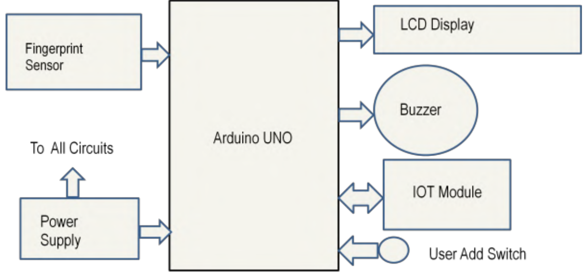
2 PROBLEM DEFINITION-

The problems which are encountered in the previous identification systems are:

- Student impersonation
- Insecure authentication of students
- Manual Verification of students
- Corruption in Examination System

3 METHDOLOGY-

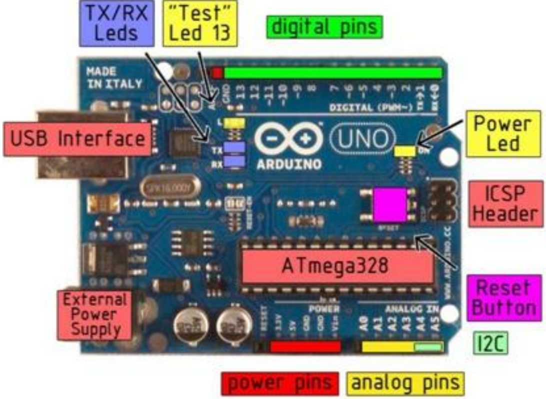
BLOCK DIAGRAM-



4 HARDWARE DESCRIPTION

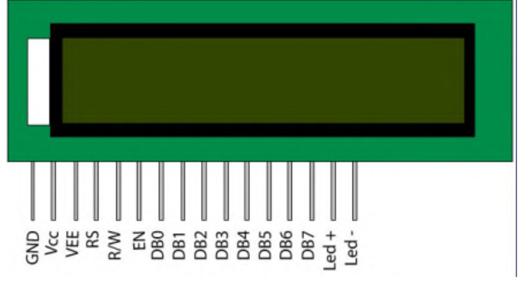
ARDUINO UNO-

The Arduino Uno is a microcontroller board based on the Arduino328 (datasheet). It has 14 digital input/output pins (of which 6 can be used as PWM outputs), 6 analog inputs, a 16 MHz crystal oscillator, a USB connection, a power jack, an ICSP header, and a reset button. It contains everything needed to support the microcontroller; simply connect it to a computer with a USB cable or power it with a AC-to-DC adapter or battery to get started. The Uno differs from all preceding boards in that it does not use the FTDI USB-to-serial driver chip. Instead, it features the Arduino8U2 programmed as a USB-to-serial converter. "Uno" means one in Italian and is named to mark the upcoming release of Arduino 1.0. The Uno and version 1.0 will be the reference versions of Arduino, moving forward



16X2 ALPHANUMERIC DISPLAY-

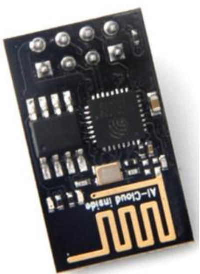
LCD (Liquid Crystal Display) screen is an electronic display module and find a wide range of applications. A 16x2 LCD display is very basic module and is very commonly used in various devices and circuits. These modules are preferred over seven segments and other multi segment LEDs.
A 16x2 LCD means it can display 16 characters per line and there are 2 such lines.



IOT MODULE-

The ESP8266 Wi-Fi Module is a self contained SOC with integrated TCP/IP protocol stack that can give any microcontroller access to your Wi-Fi network. The ESP8266 is capable of either hosting an application or offloading all Wi-Fi networking functions from another application processor.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara



Fingerprint sensor-

The fingerprint algorithm extracts features from the acquired fingerprint image and represents the fingerprint information. The storage, comparison, and search of fingerprints are all done by operating fingerprint features. Fingerprint processing includes two processes: fingerprint registration process and fingerprint matching process.

Buzzer-

Piezoelectric Sounders / Buzzers are sound components prepared by incorporating a piezoelectric vibration plate in a plastic case (resonator)..
This characteristic allows them to be used in a wide range of applications. They come as the SMD type, which is optimal for small, high-density mounting and the pin type, which can be used for general purposes.

5 WORKING PRINCIPLE-

It is divided into two stages. They include the:
I. Enrollment
II. Verification

Enrollment:
The device comes on when it is powered. When an individual is to be registered, a number is assigned to him/her using the keypad. This number assigned is automatically stored in the EEPROM of the ARDUINO IC used. When the individual places his/her hand on the finger print module, it captures the print and transfers it into the EEPROM and later stores in the memory card. This process is repeated to be stored in the memory of ARDUINO IC for confirmation. All the activity performed by the microcontroller is being displayed on the liquid crystal display (LCD).
Verification:
The system verifies the student by scanning the fingerprint and compares with the ARDUINO captured image. If the image is registered, it prints out the individual's identification number to confirm his eligibility.
When a wrong finger is placed on the module, it scans the image, sends it to the ARDUINO. This browses through the images in its memory

DIRECTOR
Yashoda Technical Campus
Satara

and if nothing is found, it prints out a message stating that the person in question has no personal details in its memory. A message "NOT REGISTERED" is displayed on the screen. Figure 1 and 2 depict the flowchart of the enrollment and verification stage.

6 RESULT-

Fingerprint matches

Fingerprint not matched

Sr No.	Condition	Result
1.	When fingerprint is matched with already stored data.	It displays the individual's identification number. And door of examination hall will open.
2.	When fingerprint is not matched with already stored data.	A message not matched is displayed on screen. And door of examination hall will not open.

ADVANTAGES-

- This project can be used to easily indetification of authorised person.
- Security
- Complexity of design can be reduced and made compact.
- Unique Identification of Individual Level

DISADVANTAGES-

- The sensors are costly.
- If power supply fails circuits won't work.

7 FUTURE SCOPE-

Further research can be carried out to have more than one biometric technique like a fingerprint and facial recognition and also in very large scale organization, that the memory card cannot contain all the data. A hard-drive can be used.

8 COCLUSION-

The system will successfully identify and verify the registered understudy fingerprint and stored the verified understudy so that the lecturer can retrieve the list of all understudies that was verified to take an examination. The system gives the time when the understudy was verified. In other words, the system generates a report in real time using the understudy fingerprint to avoid or prevent impersonation.

IOT Based Underground Drainage and Manhole Monitoring System for Cities

Vishakha Bhojane, Anjali Bhosale, Ankita Sankpal, Shubhada Bhosale, Ujjwala Patil

[2]UG Students, Department of Electronics and Telecommunications, Satara College Of Engineering and Management System, Limb, Satara India

ABSTRACT

The Internet of Things (IoT) consists of real life objects, communication devices attached to sensor networks in order to provide communication and automated actions between real world and information world.IoT came into existence because, without human interaction computers were able to access data from objects and devices, but it was aimed at, to overcome the limiting factors of human entered data, and to achieve cost, accuracy and generality factors. Sensor Network is a key enabler for IoT paradigm. This paper represents the implementation and design function of an Underground Drainage and Manhole Monitoring System (UDMS) for IoT applications. The vital considerations of this design are low cost, low maintenance, fast deployment, and high number of sensors, long life-time and high quality of service. The proposed model provides a system of monitoring the water level and atmospheric temperature and pressure inside a manhole and to check whether a manhole lid is open. It also monitors underground installed electric power lines. In real time, UDMS can remotely monitor current states of the manholes.

Keywords: IOT, Manhole Monitoring, Underground Drainage and Manhole Monitoring System

1 INTRODUCTION

Many cities in India have an underground drainage system and Municipal Corporation manages the sewage system for clean and healthy climate. The water in the drainage system is sometimes mixed with pure water, due to poor maintenance. The drainage system can spread to the atmosphere and diseases that caused by pathogens. Drainage is disrupted over various seasons due to change in climate, and the environment is volatile and disturbs people and disturbs their daily lives. To solve all the problems of the drainage system and to inform the municipal corporation by sending Blynk notification of the state of the drainage system, so that the officials can take the necessary steps to repair drainage system. The gas itself formed inside the bio-waste drainage system was also detected using a gas sensor to prevent explosion by the pressure inside the drainage system. So our aim of this idea is to track the drainage system using the sensor. When the sewage system is blocked or wateroverflows or the drainage lid is removed, the drainage is monitored using sensor and sensed information is transmitted via Blynk to the nearby municipal corporation official using integrated Wi-Fi, and the water overflow and gas value is displayed live in the cloud for later analysis. And the particular drainage's GPS location is also sent via Blynk Server.

2 Objective

- The main objective of this project is to keep the city clean, safety and healthy.
- If the drainage maintenance is not proper it will create problem for routine life, traffic may get jammed infectious disease may get spread and there is a chance of occurrence of accidents
- The vital consideration of this design are low cost, low maintenance, fast development, and high number ofsensors, long life time and high quality of services.

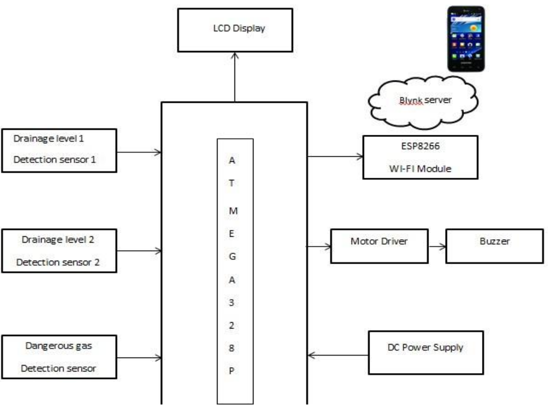
3 Motivation

If the drainage maintenance is not proper the pure water gets contaminate with drainage water and infection diseases may get spread. It will create problem for routine life. The traffic may get jammed, the environment becomes dirty and totally it upsets the public. If the manhole lid is not closed properly there is a chance of occurrence of accidents and also people or animals may get fall into the drainage. This problems is very interesting suppose imagine if we should have a remote monitoring system to monitor the internal states of the manhole and then we can solve this problem efficiently. These problems occur due to environmental changes like rainy season.

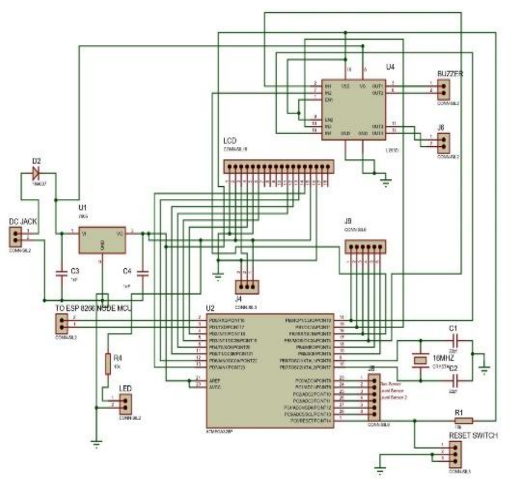
4 Proposed Work

ATmega328P Microcontroller receives live data collected from different sensors. The different sensors are Water level detection sensor and Gas sensors. The water level detection sensor and gas detection sensor sense the current states of the manholes. Sensors send sensed data to microcontroller. The output obtained from controller is sent to mobile device or computer using Blynk server. Blynk server is responsible for all interactions between smartphones and equipment.

5System Architecture



6 Circuit Diagram



Circuit Diagram Description

- In above the circuit diagram of IoT based underground drainage and manhole monitoring system for cities.
- In that we connect gas detection sensor, water level1 detection sensor1 and water level2 detection sensor2 to ATmega328p microcontroller.
- The microcontroller is connect to the ESP8266 wifi module.
- We get output on blynk application by blynk server.

7 ARDUINO IDE Software

8 Software Module

The Arduino Integrated Development Environment (IDE) is a cross-platform application (for Windows, macOS, Linux) that is written in functions from C and C++. It is used to write and upload programs to Arduino compatible boards, but also, with the help of third-party cores, other vendor development boards.

The source code for the IDE is released under the GNU General Public License, version 2. The Arduino IDE supports the languages C and C++ using special rules of code structuring. The Arduino IDE supplies a software library fromthe Wiring project, which provides many common input and output procedures. User-written code only requires two basic functions, for starting the sketch and the main program loop, thatare compiled and linked with a programstub main() into an executable cyclicexecutive program with the GNU toolchain, also included with the IDE distribution. The Arduino IDE employs the program avrdude to convert the executable code into a text file in hexadecimal encoding that is loaded into the Arduino board by a loader program in the board's firmware. By default, avrdude is used as the uploading tool to flash the user code onto official Arduino boards.

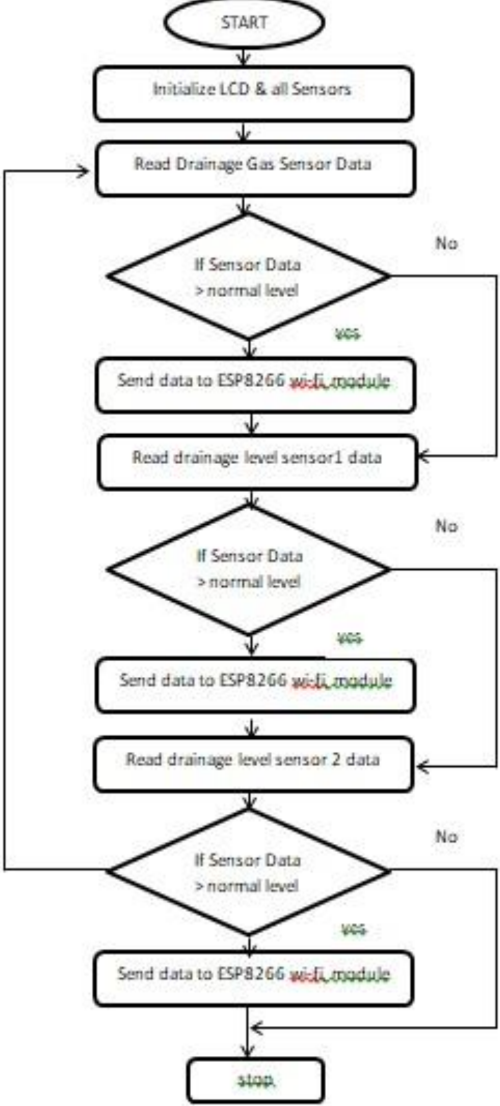


Figure Of Flowchart

Result

- When the system get started by taking power supply externally all the sensor will start working
- The gas sensor sense the harmful gases and report to microcontroller. The water level detection sensor check the flow of water and send value to microcontroller by using ATmega328P microcontroller and ESP 8266 Wi-Fi module output is shown on blynk application.

9 Conclusion

Our project helps to reduce the problem of drainage system with the help of sensors like water level detection sensor and gas sensor our mechanism helps to notify the connected network, when the harmful gases are detected to gas sensor and water level is detected by water level detection sensor with help of ATmega328P microcontroller and ESP8266 Wi- Fi module which is connected with the Blynk server. by this project the underground drainage system can be easily organized.

Automatic Barricade with Traffic Light

[1]Payal Londhe ,[2]Prasad Gujar ,[3]Abhishek Sungar,[4]Komal Andhare,[5]Akanksha Ramugade

[1,2,3,4,5] UG Students, Department of Electronics and Telecommunication Engineering Yashoda Technical Campus Wadhe,Satara ,India

ABSTRACT

India is the second largest road network in the world.Traffic jams occur due to drivers violating traffic rules. One of the major reasons of accidents is violation traffic signals. In this project we are going to implement the Automatic barricade with traffic light using Arduino UNO R3 . Till date traffic controlling system was based on traffic police and electronic signals. Hence it necessary to implement the Automatic barricade with traffic light system for the purpose of reducing accidents and smooth moving of traffic.

Implementation of the Automatic barricade with traffic light system will ensure that driver will have to compulsorily follow traffic signals and violation of traffic signals will not be possible

Keywords: Traffic control, Arduino , Traffic Signal, Barricade..

1 INTRODUCTION

Safety begins right from our self, so it is at most important to follow traffic rules and regulations.

The focus of this project is to improve the current traffic system and reduce this grave issue of traffic congestion to some extent.

We have considered here a four lane road. To stop the people from breaking the signals we will install 4 barricades which will block the road once the signal turns red.

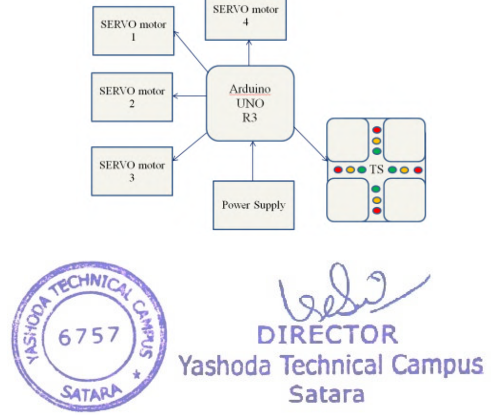
Red LED indicates CLOSED , Yellow LED indicates driver be ready to drive or be ready to stop and green LED indicates OPEN..

2 PROBLEM DEFINITION

The problems which are encountered in the previous identification systems are:

- We know that the yellow light is getting on at least two time , one is for get ready to drive and second is get ready to stop.
- For that we will keep the message plate as " Go Slow ".

3 BLOCK DIAGRAM



4 HARDWAREDESCRIPTION-

ARDUINO UNO-

The Arduino Uno is a microcontroller board based on the Arduino328 (datasheet). It has 14 digital input/output pins (of which 6 can be used as PWM outputs), 6 analog inputs, a 16 MHz crystal oscillator, a USB connection, a power jack, an ICSP header, and a reset button. It contains everything needed to support the microcontroller; simply connect it to a computer with a USB cable or power it with a AC-to-DC adapter or battery to get started. The Uno differs from all preceding boards in that it does not use the FTDI USB-to-serial driver chip. Instead, it features the Arduino8U2 programmed as a USB-to-serial converter. "Uno" means one in Italian and is named to mark the upcoming release of Arduino 1.0. The Uno and version 1.0 will be the reference versions of Arduino, moving forward

SERVO MOTOR SG90-

The Tower Pro SG90 is a simple Servo Motor which can rotate 90 degrees in each direction (approximately 180 degrees in total) , and it operates on 5V.

BARRICADE-

Barricade is any object or structure that creates a barrier or obstacle to control, block passage or force the flow of traffic in the desired direction

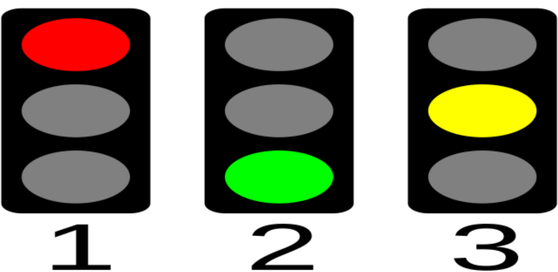
TRAFFIC SIGNAL –

In simple words, traffic lights usually change in this order:

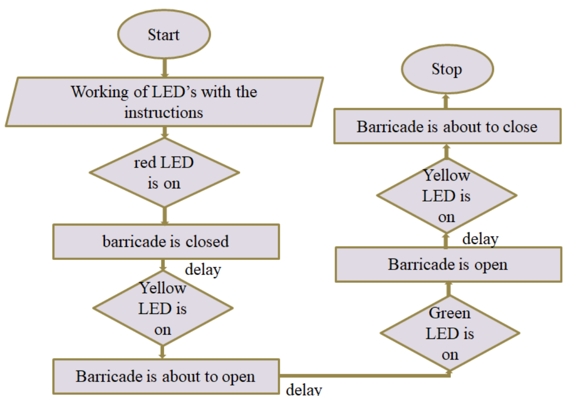
Red light on: This tells drivers to stop.

Green light on: This means the driver can start driving or keep driving.

Yellow light on: This tells drivers to stop when it is safe to, because the light is about to turn red OR ready to drive because the light is about to green .

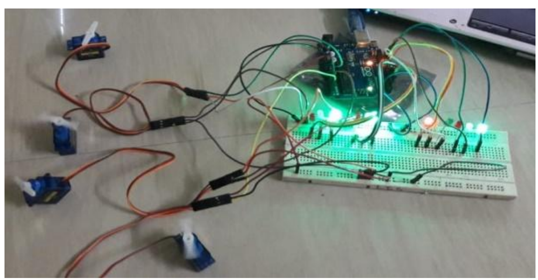


5 WORKING PRINCIPLE WITH FLOWCHART –



5 RESULT-

The result of our project is , when the red light is on barricade is in down position .
when yellow led will glow after red signal it will be sign of be ready to go .
once the led get's green it will be in open position and here yellow led glow once again that will be sign of be ready to stop.
This process is continuously happen with all lanes and automatically the frequency of accidents due to traffic breaking will be reduce.



6 ADVANTAGES & DISADVANTAGES

- Help's in reducing the frequency of an accident's.
- This system will also boost the mission of "Smart City".
- Provide authority to the drivers to move with confidence.
- Will reduce traffic police work load.

- Direct traffic on different routes without excessive congestion.

DISADVANTAGES-

- This is only useful for 2 way road's.

7 COCLUSION-

- Very effective in controlling traffic.
- This will help in betterment of smooth moving traffic.
- It ensure that drivers will not face traffic jams and enjoy the drive.
- The issues of accident can be reduced drastically.

ABSTRACT:
In this review we explain all the detailed information about Microwave assisted synthesis. Now a days the Microwave very much beneficial in to Microwave assisted synthesis reaction for green chemistry work by the various reactions. this is initially used by the save energy and rate of reaction is fast. Microwave synthesis capable of predicting many properties and rate of synthesis reaction is fast in small period of time to get from product. all type chemical reaction synthesis is also done by this microwave. various authors words on their subject by using this Microwave assisted synthesis. I show interest into microwave because of this is very beneficial for performing synthesis of reaction. In microwave various principals are added and this will be beneficial or helpful to guide scientist.

KEYWORDS: Microwave assisted synthesis, green chemistry, Microwave.

1. INTRODUCTION:

Green chemistry is defined as environmentally benign chemical synthesis.in that microwave is a general-purpose green chemistry for performing reaction in small period of time. Microwave initially started used in or released in 1986 by the groups of Gedye and Giguere/ Majetich although the use is microwave heating in chemical purpose can be back to 1950. And originates from scientist Gedye and Giguere started his research microwave synthesis in the using green chemistry. if focusses on a process whether carried out in industry or chemical laboratory. the reduced the use and generation of harmful substance or byproduct. Green chemical deals with environmentally for chemical synthesis to devise pathway for the prevention of pollution according to Paul T. Anastas[1]

Evaluation of Anti-hyperlipidemic Activity of Red Onion In Experimental Animals

Pooja Kadam *[1], Vitthal Chaware [2], Vivek Redasani [3]

[1]Department of Pharmacology, YSPM's Yashoda Technical Campus Wadhe, Satara, India.

[2]Head of Department (Pharmacology), YSPM's Yashoda Technical Campus, Wadhe, Satara, India.

[3]Principal, YSPM's Yashoda Technical Campus, Wadhe, Satara, India.

ABSTRACT

Objective: To evaluate antihyperlipidemic effect of red onion on poloxamer 407 induced hyperlipidemia in wistar albino rats.

Methods: Hyperlipidemia was induced by intraperitoneal injection of poloxamer-407 (P-407) at a dose of 1.0g/kg body weight in wistar albino rats. Drug treatments were done by oral gavage for 21 days. At the end of the study, animals were kept fasted over night and then blood samples were collected. The serum total cholesterol (TC), triglycerides (TG), and High density lipoprotein (HDL) were measured while low density lipoprotein (LDL) and very low density lipoprotein (VLDL) were calculated by Friedewald formula and atherogenic index was also calculated.

Results: From the present investigation, it was observed that ethanolic extract of red onion have shown significant reduction in serum cholesterol, triglyceride and lipoprotein levels and increase in HDL level in P-407 induced hyperlipidemia.

Conclusion: The findings in this study revealed the effectiveness of ethanolic extract of red onion against hyperlipidemic activity.

Key words: Hyperlipidemia, Poloxamer 407, red onion, Atorvastatin, Lipid Profile

INTRODUCTION:

Hyperlipidemia is also termed as acquired hyperlipoproteinemia; high blood triglycerides; high blood cholesterol; high cholesterol; high triglycerides; hyperlipidemia etc. [1]. It is an elevation of one or more of the plasma lipids, including triglycerides, cholesterol, cholesterol esters and phospholipids etc. [2]. It is also described by elevation of serum total cholesterol and low density and very low-density lipoprotein cholesterol and decreased high-density lipoprotein levels [3–6]. Number of clinical trials have verified that increase in plasma total cholesterol (TC) and triglycerides (TG) levels are implicated in the development of atherosclerosis [2]. It is also one of the important risk factor for developing cardiovascular diseases (CVDs) [4,7,8]. Principal CVDs associated with hyperlipidemia are hypertension, ischemic heart diseases, stroke, coronary heart diseases (CHDs) and atherosclerosis. They account for almost 80% of the burden of CVD in both developed and developing countries. A 20% decrease in blood cholesterol level can reduce about 31% of CHD incidence, and 33% of its mortality rate [9]. Because of all these risks associated with hyperlipidemia, treatment is often recommended for people with hyperlipidemia [10].

Effective treatment of hyperlipidemia includes dietary modifications and medications. There are number of antihyperlipidemic agents available in the market but they show certain side-effects and contraindications [10]. Statins are the first-line drugs for treatment of hyperlipidemia which act by inhibiting 3-hydroxy-3-methyl-glutaryl-

DIRECTOR Yashoda Technical Campus Satara

953

coenzyme A (HMGCoA) reductase. However, statins have some adverse effects including rhabdomyolysis and derangements in hepatic function. Fibrates are used as second-line drugs for the treatment of dyslipidemia which acts by activating peroxisome proliferator-activated receptor alpha. However, fibrates shows adverse effects like allergic reactions, nausea, diarrhea etc. Nicotinic acid is also used to treat hyperlipidemia. However, it causes flushing, nausea, vomiting, diarrhea, anorexia like side-effects. Ezetimibe and bile acid sequestrants shows hypolipidemic effect by decreasing intestinal cholesterol absorption; but these drugs are associated with increased gastrointestinal adverse events and also affect the absorption of other biologically important substances [11]. An herbal treatment for hyperlipidemia has no side effects and is relatively less costly, locally available [4]. Hence, people are more interested towards traditional medicinal plants due to their natural origin, safe and non-toxic nature [12].

Red onion (*Allium cepa* L.) is the most widely cultivated species of the genus Allium. The portion of the plant commonly used is the bulb, utilized as a food ingredient to give flavour and aroma to a large variety of dishes [13]. Red onion has been reported to contain flavonoids, phenols, tannins, triterpenoids, cardiac glycosides, saponin and steroid phytochemicals [14]. It also contains Quercetin, cycloalliin, S-methyl-L-cysteine, S-propyl-L-cysteine sulfoxide, dimethyl trisulfide, S-methyl-L-cysteine sulfoxide etc. Literature survey indicates that red onion possesses anti-diabetic [15], Anti-Obesity [16], Hepatoprotective [17], Antidepressant [18], Analgesic [19], Anti-inflammatory [19] and antimicrobial activity etc [14]. Therefore, the present investigation was undertaken to evaluate hypolipidemic effect of ethanolic extract of red onion in poloxamer 407 induced hyperlipidemic rats which has not been previously reported. It is our belief that this investigation will take us another step forward in our quest to understand the mechanism of action of red onion in prevention and treatment of arteriosclerosis and heart related diseases.

MATERIALS AND METHODS:

Drugs & chemical

Poloxamer 407 was acquired from Emcure Pharmaceuticals Ltd Pune. Atorvastatin (Lipvas 20, cipla ltd.) was purchased in a tablet form at strength 20 mg. All other chemicals and reagents used were of analytical grade and procured from approved chemical suppliers. The total cholesterol (TC), triglycerides (TG) and high-density lipoprotein (HDL) were measured with the help of commercial kits.

Collection and extraction of plant material

Fresh red onions were purchased from a local market, satara and were identified by a botanist. They were washed with tap water and then cut into medium pieces. The chopped onions were then blended. The blended onion (200 g) then macerated in 2000 ml ethanol and allowed to stand for a period of 72 h. It was filtered using Whatman filter paper (No. 1). The filtrate was concentrated at 40°C in a water bath for complete dryness. Crude extract obtained was stored at 4°C for further use [20].

Experimental animals

The complete experiment was carried out using 36 wistar albino rats of either sex weighing 150 -200g. The study protocol was approved by Institutional Animal Ethics Committee (IAEC) of YSPM, Satara. The animals were procured from registered breeder and acquainted in the quarantine area for one week. Animals were housed in clean polypropylene cages in a controlled room temperature 22°C ± 2°C, relative humidity of 50 ± 15% and 12 hr dark/ 12 hr light cycle at our Institution's animal house and allowed to acclimatize for two weeks. The animals were fed with standard pellet diet and water *ad libitum*. Animals were maintained as per Committee for the Purpose of Control and Supervision of Experiments on Animals Guidelines.

Preparation of standard drug

Atorvastatin tablets were crushed into powder, dissolved in distilled water at dose 10mg/kg b. w. and administered orally *ad libitum* [9,21].

Induction of hyperlipidaemia

Poloxamer 407 dissolved in cold distilled water at dose 1.0g/kg b. w. and introduced intraperitoneally. All syringes were placed on ice prior to P-407 administration to maintain the polymer in a mobile viscous state during the injection [9,21].

Experimental design

A total 36 wistar albino rats of either sex were randomly divided into 6 groups containing 6 animals in each group. Group 1 (Normal control) did not receive any treatment apart from vehicle 10ml/kg b. w. /day for 21 days. Group 2 (Hyperlipidemic control) were induced with 1.0g/kg b. w. dose of P-407 without treatment [22]. Group 3 (Standard control) were induced with 1.0g/kg dose of P-407 and treated with atorvastatin at a dose of 10mg/kg b. w. /day for 21 days. Group 4, 5 and 6 were induced with 1.0g/kg dose of P-407 and treated with test drug at dose 200 (low), 300 (medium) and 400 (high) mg/kg b. w. /day for 21 days respectively [21].

Blood Sample Collection

At end of the experimental period, animals were kept fasted over night and anaesthetized with diethyl ether. Blood samples were collected serially by retro orbital puncture. The blood was allowed to clot for 30 min at room temperature then serum was separated by centrifugation and used for lipid analysis.

Evaluation parameters

Body weight

Body weight were recorded on the first day of treatment of all groups and final body weight were taken at the end of treatment of all groups to calculate changes between the initial and final body weight of animal throughout the study.

Biochemical parameters

The resulting serum was analyzed for serum TC and TG by Quinoneimine dye absorption method at 505 nm [23] and HDL by precipitation with phosphotungstic acid and Magnesium chloride [24].

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Very low density lipoprotein cholesterol (VLDL-C) was calculated as [11,25,12]:

VLDL = TG/5.

Low density lipoprotein cholesterol (LDL-C) levels were calculated using Friedewald's formula [25]:

LDL = TC - HDL - TG/5

The atherogenic index (A.I.) was calculated using the following formula [26]:

(A.I.) = LOG (TG/HDL)

Liver histopathology

The fixed specimens of liver were processed by washing through running tap water, dehydration through ascending grades of alcohol, clearing through xylene and embedding completely with in paraffin into blocks. The serial sections of not exceeding 3 mm thickness were cut using microtome and were mounted on polylysine coated slides, deparaffinised using xylene, rehydrated and stained with hematoxylin and eosin, dehydrated, cleared and mounted on DPX under glass cover slips. The slides were then observed under light microscope which was connected to a camera to capture images.

Statistical analysis

The results were expressed as Mean ± SEM (n=6). The statistical analysis was carried out with Graph pad prism 5.0 software. The data was statistically analyzed using one-way ANOVA followed by Tukey's multiple comparison tests and $p < 0.05$ was considered to be statistically significant.

RESULTS & DISCUSSION

RESULTS

Yield of the extract

The yield of the extract was found to be 3.7%. Further preliminary phytochemical screening revealed the presence of flavonoids, saponins, phenol, diterpenes, triterpenes, alkaloids, phytosterol and proteins.

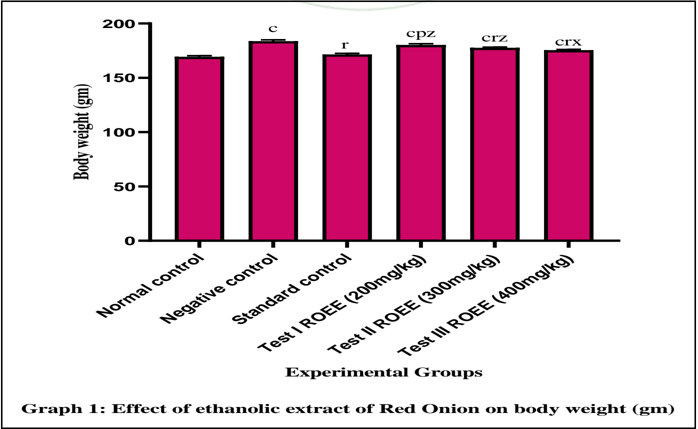
Body weight

Effect of administration of ethanolic extract of red onion on body weight of experimental animals has been shown in table 1. When compared with normal control group, negative control group and all test group animals showed significant ($p<0.001$) increase in body weight but standard control group animals do not show any significant changes in body weight. Furthermore, Standard control group and test II and III group animals showed significant ($p<0.001$) reduction in body weight, whereas test I group showed significant ($p<0.05$) reduction in body weight as compared to negative control group.

Table 1: Effect of ethanolic extract of red onion on body weight of P-407 induced hyperlipidemia in experimental animals.

Sr.	Experimental group	Initial body weight (gm)	Final body weight (gm)	Change in body weight (gm)
1	Normal control	166.6 ± 1.186	169.4 ± 1.622	4.642 ± 1.284
2	Negative control	170.30 ± 3.963	183.8 ± 1.126 ^{c}	13.45 ± 1.098
3	Standard control	168.9 ± 2.032	171.6 ± 1.287 ^{r}	5.33 ± 1.305
4	Test I (200mg/kg)	170.74 ± 2.889	180.3 ± 1.425^{cpz}	9.615 ± 1.491
5	Test II (300mg/kg)	168.75 ± 2.067	177.4 ± 0.689^{crz}	8.03 ± 1.56
6	Test III (400mg/kg)	169.15 ± 1.833	175.5 ± 0.872^{crx}	7.28 ± 1.046

Normal control: distilled water; Negative control: Poloxamer 407; Standard control: Atorvastatin; Test I: ROEE (200mg/kg); Test II: ROEE (300mg/kg); Test III: ROEE (400mg/kg).



Graph 1: Effect of ethanolic extract of Red Onion on body weight (gm)

Values represented mean ± SEM; n=6; Analysis was performed using one way ANOVA followed by Tukey's multiple comparison test; p value less than 0.05 was considered as statistically significant. a<0.05, b<0.01, c<0.001; Data compared with normal control; p<0.05, q<0.01, r<0.001 Data compared with negative control; x<0.05, y<0.01, z<0.001 Data compared with standard control (by one way ANOVA followed by Tukey's multiple comparison test)

Serum lipid profile

Poloxamer 407 administration developed acute hyperlipidemia in rats by significantly increasing the level of total cholesterol, triglycerides, lipoproteins and decreasing HDL level as compared to normal control group.

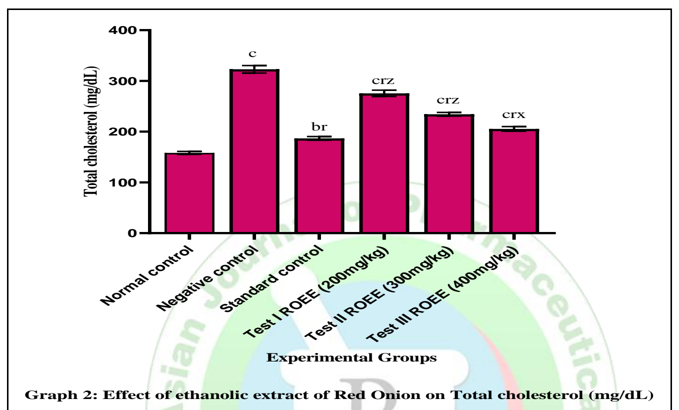
Effect of ethanolic extract of red onion on Total cholesterol

Table 2 shows that the ethanolic extract of red onion has significantly affected the level of total cholesterol in hyperlipidemic rats. The results found that the negative control group showed significant (p<0.001) increase in the level of TC as compared to normal control group. Whereas standard control, test I, test II and test III groups showed significant (p<0.001) reduction in TC level when compared with negative control group.

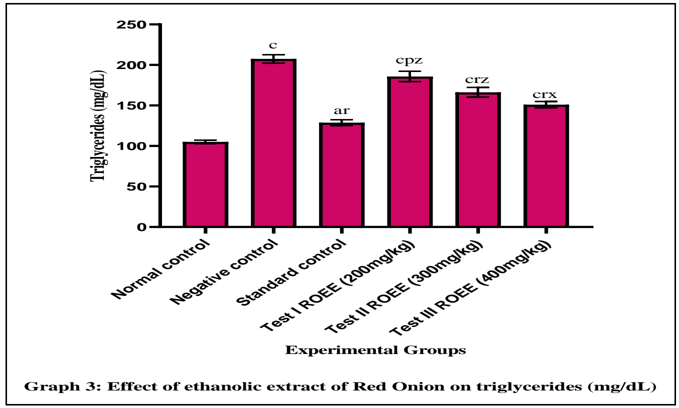


Graph 2: Effect of ethanolic extract of Red Onion on Total cholesterol (mg/dL)

Values represented mean ± SEM; n=6; Analysis was performed using one way ANOVA followed by Tukey's multiple comparison test; p value less than 0.05 was considered as statistically significant. a<0.05, b<0.01, c<0.001; Data compared with normal control; p<0.05, q<0.01, r<0.001 Data compared with negative control; x<0.05, y<0.01, z<0.001 Data compared with standard control (by one way ANOVA followed by Tukey's multiple comparison test).

Effect of ethanolic extract of red onion on Triglycerides

The mean values for triglyceride level are given in table 2. Negative control group showed significantly (p<0.001) increased level of triglycerides as compared to normal control group. Standard control, test II and test III group showed significant (p<0.001) reduction and test I group showed significant (p<0.05) reduction in the level of triglycerides as compared to negative control group.



Graph 3: Effect of ethanolic extract of Red Onion on triglycerides (mg/dL)

Values represented mean ± SEM; n=6; Analysis was performed using one way ANOVA followed by Tukey's multiple comparison test; p value less than 0.05 was considered as statistically significant. a<0.05, b<0.01, c<0.001; Data compared with normal control; p<0.05, q<0.01, r<0.001 Data compared with negative control; x<0.05, y<0.01, z<0.001 Data compared with standard control (by one way ANOVA followed by Tukey's multiple comparison test).

Effect of ethanolic extract of red onion on HDL

According to the data presented in table 2, the negative control group showed significant (p<0.001) decrease in the level of HDL as compared to normal control group. Whereas significant increase in the level of HDL was observed in standard control (p<0.001), test I (p<0.05), test

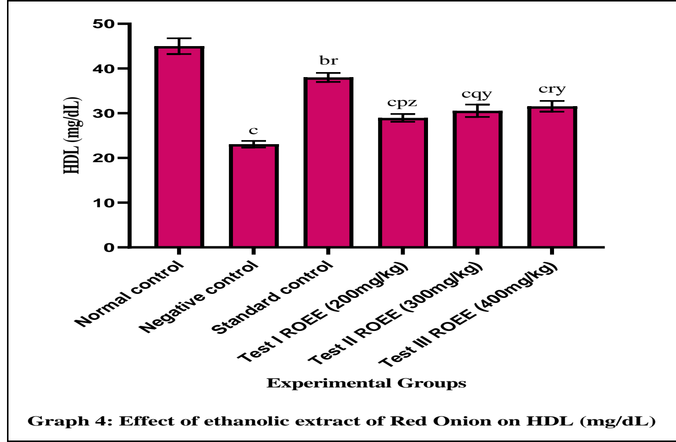
II ($p<0.01$) and test III ($p<0.001$) group when compared with negative control group.

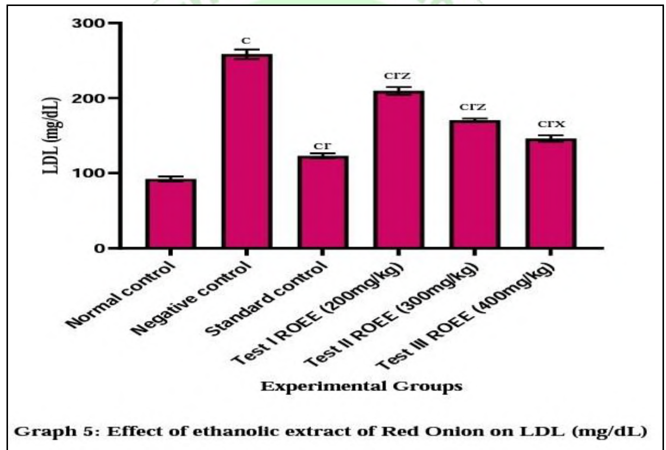


Graph 4: Effect of ethanolic extract of Red Onion on HDL (mg/dL)

Values represented mean ± SEM; n=6; Analysis was performed using one way ANOVA followed by Tukey's multiple comparison test; p value less than 0.05 was considered as statistically significant. a<0.05, b<0.01, c<0.001; Data compared with normal control; p<0.05, q<0.01, r<0.001 Data compared with negative control; x<0.05, y<0.01, z<0.001 Data compared with standard control (by one way ANOVA followed by Tukey's multiple comparison test).

Effect of ethanolic extract of red onion on LDL

The mean values for LDL levels in normal and hyperlipidemic groups are given in table 2. When compared with normal control group negative control group showed significant ($p<0.001$) increase in the LDL level. While as compared to negative control group the standard control, test I, II and III group showed significant ($p<0.001$) decrease in LDL level.



Graph 5: Effect of ethanolic extract of Red Onion on LDL (mg/dL)

Values represented mean ± SEM; n=6; Analysis was performed using one way ANOVA followed by Tukey's multiple comparison test; p value less than 0.05 was considered as statistically significant. a<0.05, b<0.01, c<0.001; Data compared with normal control; p<0.05, q<0.01, r<0.001 Data compared with negative control; x<0.05, y<0.01, z<0.001 Data compared with standard control (by one way ANOVA followed by Tukey's multiple comparison test).

Effect of ethanolic extract of red onion on VLDL

Table 2 illustrated that the level of VLDL in different treatment groups was considerably affected. The negative control group showed significant ($p<0.001$) increase in the level of VLDL as compared to normal control group. Whereas test I group showed ($p<0.05$) and standard control, test II and III showed ($p<0.001$) significant reduction in VLDL level as compared to negative control group.

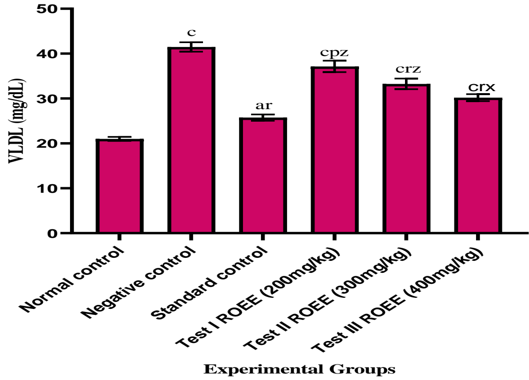
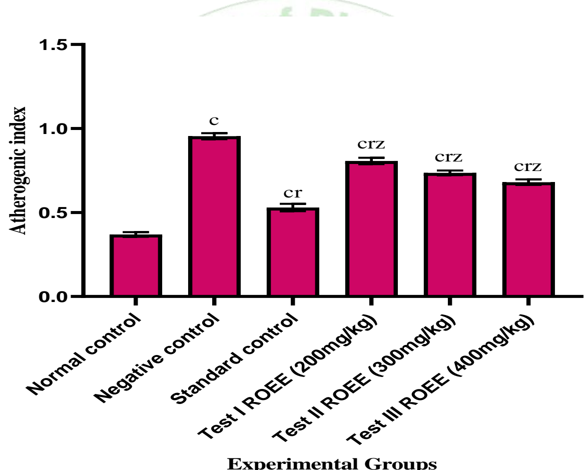


Graph 6: Effect of ethanolic extract of Red Onion on VLDL (mg/dL)

Values represented mean ± SEM; n=6; Analysis was performed using one way ANOVA followed by Tukey's multiple comparison test; p value less than 0.05 was considered as statistically significant. a<0.05, b<0.01, c<0.001; Data compared with normal control; p<0.05, q<0.01, r<0.001 Data compared with negative control; x<0.05, y<0.01, z<0.001 Data compared with standard control (by one way ANOVA followed by Tukey's multiple comparison test).

Effect of ethanolic extract of red onion on Atherogenic index

According to the data presented in table 2 the negative control group showed significant ($p<0.001$) increase in the atherogenic index as compared to normal control group. Whereas standard control and all test groups showed significant ($p<0.001$) reduction in atherogenic index as compared to negative control group.



Graph 7: Effect of ethanolic extract of Red Onion on atherogenic index

Values represented mean ± SEM; n=6; Analysis was performed using one way ANOVA followed by Tukey's multiple comparison test; p value less than 0.05 was considered as statistically significant. a<0.05, b<0.01, c<0.001; Data compared with normal control; p<0.05, q<0.01, r<0.001 Data compared with negative control; x<0.05, y<0.01, z<0.001 Data compared with standard control (by one way ANOVA followed by Tukey's multiple comparison test).

Histopathological changes

Histopathology of the liver for normal control, negative control and test III group were carried out

Histopathological observation of liver in normal control group

The normal control group animals showed normal hepatocyte architecture such as healthy nucleus and parenchymal structure [Fig.1 (a) & (b)].

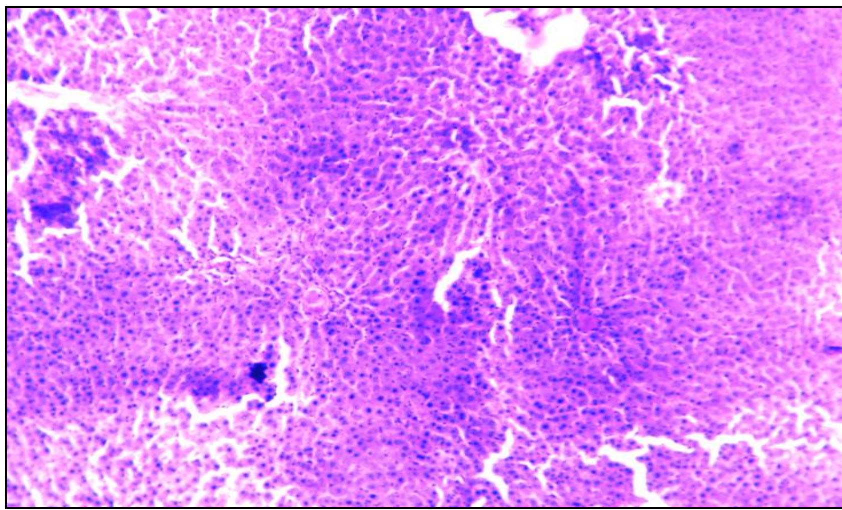


Figure 1 (a): Liver section (100X) of normal control group showing normal hepatocytes

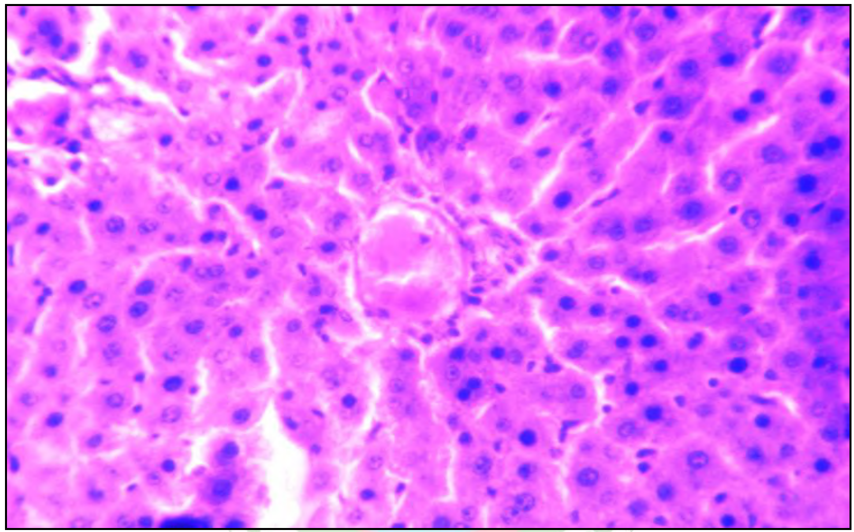

Figure 1 (b): Liver section (400X) of normal control group showing normal hepatocytes

Histopathological observation of liver in negative control group

As compared to normal control group the negative control group animals showed fatty changes, altered hepatocyte architecture along with necrosis, congestion and leucocytic infiltration [Fig.2 (a) & (b)].

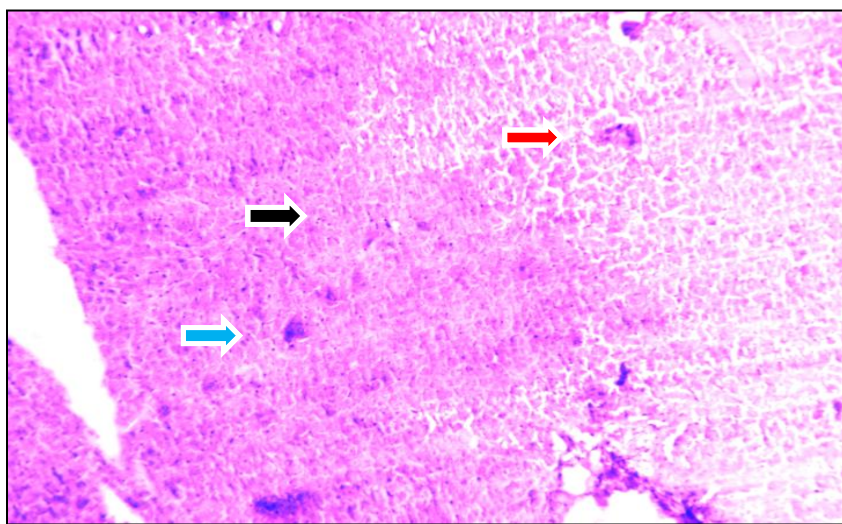

Fig 2 (a). Liver section (100X) of negative control group showing necrosis (Black arrow), congestion (red arrow) and leucocytic infiltration (blue arrow)

DISCUSSION

Lipids are organic compounds which are water insoluble but soluble in organic solvents. Lipids perform number of functions such as chemical messengers, storage and provision of energy, maintenance of temperature and membrane lipid layer formation. Hyperlipidemia is nothing but abnormally elevated level of lipids such as total cholesterol (TC), triglyceride (TG) and lipoproteins [26]. Diseases associated with hyperlipidemia are major risk factors for development of cardiovascular diseases (CVD) [27]. Hyperlipidemia is risk factor for onset and progression of atherosclerosis [28,29] viz high risk factor in development of coronary heart diseases [26]. Hence prevention or treatment of such disorders can be achieved by targeting the causative hyperlipidemia [27].

P – 407 induced hyperlipidemia is one of the animal model used for the evaluation of antihyperlipidemic activity of drug. It was harmless to membranes of cells, in earlier studies it was used effectively to induce hyperlipidemia. Poloxamer 407, a non-ionic synthetic copolymer surfactant commonly known used to induce hyperlipidemia in small laboratory animals within 24 h through i. p. injection. Due to its rapid onset, convenience, reproducibility, and lack of undesirable toxicity, P-407 was used in this study to induce hyperlipidemia in animals [11,30]. A single injection of P-407 caused elevations of serum cholesterol and triglyceride levels in rats. P-407 induced hyperlipidemia via alterations in activity of 3-hydroxy-3- methylglutaryl-CoA (HMG-CoA) reductase, lipoprotein lipase (LPL), lecithin cholesterol acyltransferase (LCAT), cholesteryl ester transfer protein (CETP), hepatic lipase (HL) and lipoprotein lipase (LPL). P-407 directly inhibits the capillary (heparin releasable) LPL and HL, and it indirectly increases the biologic activity of CETP and LCAT [9,31].

In our analysis, there was marked increase in the level of total cholesterol, triglycerides, LDL,VLDL, AI and decrease in the level of HDL in negative control group as compared to normal control group (Table 2) confirming that i.p. injection of P-407 has induced hyperlipidemia experimentally [9]. Red Onion ethanolic extract (200mg/kg, 300mg/kg and 400mg/kg) significantly decreased the increased level of total cholesterol, triglycerides, LDL,VLDL, AI and increased the level of HDL after treatment suggest the ameliorative potential of Red Onion.

In our analysis the body weight gain of different groups of rats showed that negative control group animals showed the significant increase in the body weight as compared to normal control group animals. After treatment with standard and test drug the body weight decreased significantly.

In this study, the significant elevation of TC concentration was achieved by the indirect stimulation of HMG CoA reductase by an intraperitoneal (i.p) injection of P-407 [26]. Hence the hypocholesterolemic effect of red onion ethanolic extract could be due to decreased activity of hepatic HMG CoA reductase, stimulation of Cholesterol-7-alpha-hydroxylase, which converts cholesterol into bile acids. It could also be due to the presence of saponins, a phytochemical which forms insoluble complexes with cholesterol or their bile salt precursor, thus making them unavailable for absorption. The results obtained in our analysis conform to earlier report that polyphenols possesses antilipidemic activity [9,26]. Besides, the standard drug (Atorvastatin) used in this study inhibits HMG CoA reductase, viz a rate limiting enzyme in the biosynthesis of cholesterol [26].

In our analysis, elevation in TG concentration after P-407 i.p. injection results primarily from an inhibition of TG degradation, P-407 directly inhibits capillary lipoprotein lipase (LPL) enzyme which is responsible for plasma TG hydrolysis and its clearance from the circulation [11,26]. The Red Onion ethanolic extract could have reduced TG levels by either activating lipoprotein lipase enzyme which hydrolyses the triglyceride into fatty acid hence decreasing triglyceride levels or by inhibiting lipolysis so that fatty acids do not get converted to triglyceride [11, 12, 26].

HDL act as cholesterol scavengers, they transport excess cholesterol and cholesterol esters from the blood and peripheral tissues back to the liver where it is broken down to bile acids. It plays a crucial role in reducing blood and peripheral cholesterol concentrations and inhibits formation of atherosclerotic plaque in the aorta therefore known as the protective cholesterol or Good cholesterol [26]. The present study indicates significant elevation in HDL concentration by the standard drug and ROEE. This could possibly be due to increasing activity of lecithin-cholesterol acyl transferase (LCAT), an enzyme which is responsible for incorporating free cholesterol into HDL there by promoting reverse cholesterol transport and competitively inhibiting the uptake of LDL-c by endothelial cells.

LDL (low density lipoprotein) transports cholesterol to the body cells. It transports near 60-70% of total cholesterol to the body cells. Therefore, an increase in TC level accordingly increases LDL-c [26]. LDL is referred as the most dangerous among the serum lipids, and the oxidation of LDL-c leads to its increased penetration of arterial walls. The increased LDL-c levels play a vital role in the development of atherosclerotic lesions that progress from fatty streaks to ulcerated plaques. Therefore, serum LDL levels are used as the basis for initiating and monitoring the treatment of patients with elevated blood cholesterol levels [9]. In the present study, ROEE shows marked reduction in LDL levels (Table 2). This result could be due to the presence of phenolics, a phytochemical which may work by increasing LDL receptors densities in the liver binding to apolipoprotein B thereby making liver cells more efficient to remove LDL from circulation [26].

Very low density lipoproteins (VLDLs) are secreted from the liver. They contain large amount of triglycerides. As it eventually gets converted into LDL and causes buildup of cholesterol on the walls of arteries it is categorized as a type of bad cholesterol [32]. The present study indicates significant decrease in VLDL concentration by the ROEE. This effect could probably be due to the inhibition of triglyceride and possibly fatty acid synthesis by phenolic constituents of red onion. Atherogenic risk predictor index log (TG/HDL-c) has been considered as the most accurate in determining the extent of atherosclerosis and the risk of myocardial infarction. The present study showed that the Red Onion ethanolic extract has significantly reduced

Yashoda Technical Campus Satara

961

atherogenic index as compared to negative control group. The results suggest the anti-atherogenic potential of Red Onion ethanolic extract and hence, reducing the development of coronary atherosclerosis [26].

Histopathology study of liver was also carried out to check fatty changes, necrosis of hepatocytes, congestion and leucocytic infiltration. The histopathological report of negative control group animals showed the development of fatty changes, necrosis of hepatocytes, congestion and leucocytic infiltration while the histopathological report of normal control group animals did not show any fatty changes. Whereas the group of animals treated with ROEE (400mg/kg) restored hepatocytes near to normal control group.

CONCLUSION

In conclusion, the present study has demonstrated that ethanolic extract of Red Onion has antihyperlipidemic effect in Poloxamer 407 induced hyperlipidemia. Red Onion ethanolic extract has showed dose dependent activities on body weight, various serum lipids and atherogenic index. Furthermore the better activities has revealed by the ROEE at dose of 400mg/kg. Utilizing this model, Red Onion ethanolic extract was shown to be effective in significantly lowering total cholesterol, triglycerides, LDL, VLDL and increasing HDL cholesterol levels; also decreasing atherogenic index; thus it can be used in the treatment and/or prevention of cardiovascular diseases.

ACKNOWLEDGEMENT

The authors are thankful to Management of YSPM's Yashoda Technical Campus, Wadhe, Satara (Mah.) for the valuable support and providing facilities to carry out this research work.

ABSTRACT:
In these review we explain all the detailed information about guassian software. Now a days the guassian very much beneficial in to computational chemistry for medicinal chemistry work by the various calculations. This is initially used bye the john poples. Guassiansoftware capable of predicting many properties and calculations of molecules and reaction. Molecular docking also done bye this software. Varios authors wordks on their subject by using this software. I shows interest into guassian because of this is very beneficial for calculations. In guassian varios mathematical equations are added and this will be feneficial or helpful to guide scientist.

KEYWORDS: Molecular docking, Drug Discovery, Guassion Software.

1. INTRODUCTION:

Guassian software is a general purpose computational chemistry software package. Guassian software initially started used in or relesed in 1970 by the scientist john pople. And the scientist john pople started his research group at the Carnegie Mellon University as guassian 70 then this continusly udtaed by them. the name of software originates from scientist pople's use of guassian orbitals to speed up the molecular electronics structure calculation opposed to using slater type of orbital then choice to 9 improve the the performace of the software on computating capacities of current computer hardware for hartee fock calculations. The current updated version of this is guassian 16. This is originally availble through quantum chemistry programme exchnage. it was later licensed out by the university carnegie mellon university ans since 1987 has been developed and licensed by the guassian.

Guassian:

Original author	**John poples**
Developers	Carnegie mellon university
Initial release	1970, 50 years
Stable release	Guassian 16/2017
Website	Www.guassian.com

We will use the guassian programme in windows environment. Guassian is capable of predicting many properties of molecules and reaction, including the following

- Molecular energies and structures
- Reaction pathway
- NMR properties
- Energies and structures of transition states
- Bond and reaction energies
- Vibrational frequecies
- Molecular orbital
- Atomic charges and electrostatic potential
- Multiple moments

Computation can be carried out on system in gas phase and in their ground state or in an excited state

Guassuian input files:

In this Guassian input files inclufdes several different sections.

- Link 0 commands- locate and name scratch files we will not use this option
- Route section- specify desired calculation type the

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

method basic sets and other options
- optional addition sections- additional input needed fo9r specific job type
- Title section- brief description of calculation.

JOB TYPES FOR GUASSIAN INPUT:

There are 3 key components to this specification

1. Job type
2. The method
3. Basic set.

Computer aided drug design:

Simply rational design is the inventive process of finding new medication based on biological target. The drugs are commonly organic small moleculesthats activates or inhibits function of biomolecules such like a protein. That is further give the therapeutic action to the patient. Basic in that isdrug design means the invole in molecules that complementry in shape and size of biomolecules. They bind with each other and form the bond. Drug design not relies on computer modelling. This type of modelling callled as computet aided drug design. Drug design depends on knowledge of 3D structures of biomolecules that is known as structural aided drug design. In addition to small molecules biopharmaceutical includes peptides ans especially therapeutic antibodies are incresingly important class of drug and computational method for improving affinity, selectivity and stability been developed.

Drug design also known as efforts to develop a new drug by molecular modification of lead compound for optimization of desired efferts and minimization of side effects.

Now a days structural based drug design is the growing, interative and powerful approaches includes the structural evaluation of target and drug discovery process it is time consuming and as well as cost cunsuming too developing ideas of new effects and potential drug lead molecule

MOLECULAR DOCKING:

Molecular docking is very useful and intresting beneficial to us docking means the attempt to find best matching between two molecules. Docking is the process in which prdedict the preffere orientation of one ligand when bound in an active site to form stable complex. Aim for the molecular docking is to achive an optimization conformation for both receptor and ligand and the relative orientation between protein and ligand such that free energy of overall system is minimized. successful dockingvmethod search high dimensional spaces effectively and use a scoring function that correctly ranks candidate docking. Importance of the molecular docking is that identification of the ligands, correct binding geometry, prediction of binding affinity. etc. therae are rigid docking is the part of molecular docking in that we studied about internal geometry of receptor and ligand. Another type of docking is flexible docking in that we studied about the enumaration on rotation of the one of the molecules is performed. There are various application of molecular docking like lower free energy structures, calculate differntial binding of ligands, library design, novo design, screening of side effects, specificity of potential drug etc [1-3].

REVIEW OF LITRETURE:

Molecular studies docking charge transfer excitation and wave function analyses valacuclovir a potential antiviral drug this study carried by author Fathima Rizwana and Christina susan abraham and software used is guassian 0.9 [4].

Quantum chemical insight into molecular structure NBO anlysis of hydrogen bonded interaction spectroscopic drg likeness and molecular docking of novel anti covid 19 author for this is SJ. Jenepha Mary and C james study carried by the software guassian 0.9 [5].

Conformational anlysis and quantum descriotors of 2 new imidazole derivative by experimental DFT, AIM molecular docking studies adsorption activity on ghraphene study by author Veena S kumar and MS roxy software used by them is guassian 0.9 [6].

Computational assesment on wave function anlysis molecular conformation and molecular docking explores on 2-5 amino-2methylanilino-4-3 pyridile pyrimidine study by author K arulabraham and S mutha and software is guassian 0.9 [7].

Quantum computational spectroscopic and molecular dockinnn studies on 2acetylthoprene and its bromination deerivatives author is M habib rahman and M raja software is guassian [8].

Synthesis of 1-2-3 bistriazole derivative of embaline and evaluation of its effect on high fat diet streptozotacin induced type 2 diabetes in rats and molecular docking author for this antony stalin and perumol palani guassian 0.9 software used by them [9].

Studies of charged transfer complex og qunodic acid with carboxyllic acid, R kavitha and Biological evaluation mol docking and DFT rajendran are the authors and guassian is software used by them. [10].

Conformational profile vibrational abign NLO properties and moleeular docking of biological active herbicide 1,1 dimethyl phenyleurea K haruna and al Saudi software guassian is used 0.9 [11].

M abhinaya and etal are the authors for the inhibition of biofilm formation quarnum sensing activity wae done on isolated 3-5-7 tri hydroxy and lave from alstonia scholoris lead by using chemistru guassian 0.9 [13].

New thiazide pyridine and pyrazole derivatives as antioxidant bcandidates synthesis DFT calculations and molecular docking by using guassian softwaew by eatal and yassine kaddouri [14].

2D QSAR and docking study of series gaumerin derivatives as inhibitions of CDR with an applicatiomof molecular docking bu guassian software author is Ranina kasmi and etal [15].

Y shyama and etal do study on the DFT and molecular docking investigation of oxicum derivatives was studied by using guassian [16].

Nasima arshad and etal studied on the structural elucidation DNA binding DFT molecular docking and cytotoxic activity studieson novel design crystal thiosemicarbazides was studied by using guassian software [17].

K haruna and etal bdo study on the confirmational profile and the vibrational assignments NLO properties and molecular docking of biological active herticides 1-1 dimethyl 3- phenykurea studies by guassian software [18].

Y shyamo mary and etal do study on the detailes quantum mechanical molecular docking QSAR prediction photovoltic light havsting efficasy analysis of benzil and its halogenated analogus studies by using guassian 0.9. [19].

Mohammad abdul mumit and tarum kumar studied on DFT studies on vibrational and electron spectro homo lumo, MEP HOMA, NBO and molecular docking analysis of benzyl, hydrazine carbodition by using guassian [20].

Towaeds better modelling drug loading in solid lipid nanoparticles molecular docking experiments done by author Rania hathout, abdelkader a metwally by using guassain software [21].

Spectral investigation, DFT computation and molecular docking studies of the Antimicrobial 5 nitroisatin dimer VK rastogi and VB joyhy are the authors, guassain software used by them. [22].

Investigation of DNA RNA molecules for efficasy and activity of corrosion inhibition by DFT and molecular docking tuzun and C kaya are authors. [23].

CONCLUSION:

The review totally focused on prediction of many properties of molecules and reactions using this software. Guassian software is an computer program helped to chemists, chemical engineers, physicist, biochemist and other scientist to predicting many properties of molecules and reactions. such as energies molecular structures, spectroscopic data ie NMR IR UV etc. These prediction based on present review have been becoming a helpful tool to guide scientist for the prediction of various properties.

REVIEW ARTICLE

Review on Discovery Studio: An important Tool for Molecular Docking

Shravani S. Pawar*, Sachin H. Rohane
Department of Pharmacy, Yashoda Technical Campus, Wadhe, Satara 415003.
*Corresponding Author E-mail: **shravanipawar118@gmail.com**

ABSTRACT:
In this paper, an overview on discovery studio docking program for analyze and modeling molecular structure, sequence of relevance to life science researcher. This software covers the areas such as ligand design, structure-based design, macromolecule design and engineering, simulations, pharmacophore modeling, quantitative structure activity relationship (QSAR), ADME, predictive toxicity. Discovery Studio help to analyze activities such as anti-convulsant, anti-viral, antidepressant, antibacterial, anti-tubercular, anti-Alzheimer, anti-malarial, anti-cancer. This software gives better result correlation with in-view pharmacological activity. So, this is a helping tool for a researcher to minimize the time as well as cost of research activity and also gives better understanding to study ligand and receptor complex.

KEYWORDS: Drug Discovery, Molecular Docking, Discovery Studio software.

INTRODUCTION:

Computer-Aided drug design represents computational resources that used to facilitate the design and discovery of new therapeutic solutions. Molecular docking is widely used in CADD due to its reliable prediction properties and is one of the essential backbones of CADD. Molecular docking is a rapid and inexpensive technique in academics as well as in industrial settings. Molecular Docking is a technique to find best matching molecular structure by interaction between enzyme and ligand. It also analyses the orientation of one molecule with other into the binding site of a macromolecular target. Docking has a major role in virtual screening, drug discovery, bioremediation.

Discovery studio software is an agglomeration to transcript small molecules and macromolecule system. It is developed by Dassault Systemes BIOVIA (Accelrys). Discovery Studio is a single unified, graphical interface for advanced drug design and protein modeling research. This software provides bunch of viewers for display plots and graphical representation of data.

Review of literature:

Ana-Maria Udrea and et al use Discovery Studio software to check the potential of phenothiazine in Covid-19 infection. They found that data given by docking software is correlated with in vivo activity. The data found to be suitable and correct with in vivo activity.

Shiben Wang and et al synthesized the different series of 1,3,4-oxadiazole derivatives using discovery studio and the compound were studied gives best anticonvulsant activity. In silico studies were carried out to explore the binding interaction of the most active compound. They found the target compounds were related with in vivo and vitro activity.

Fatma Gur and et al studied the adverse effect of Atomoxetine which issubstitute for methylphenidate in the long-term treatment of ADHD. They conduct molecular docking study using Discovery Studio programs. The data found to be match with in vivo activity.

K. Sangeetha and et al use the discovery studio to check the antiviral activities of plant derived compounds against zika virus. By In silico studies, the software used for screening of various phytochemicals against Zika virus to identify new promising drug candidates. In this study, around 5550 phytochemicals retrieved from

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

various databases were subjected for molecular docking in Discovery studio program.

Shi-Ben Wang and et al designed and synthesized the derivatives of coumarin and 3, 4-dihydroquinolinone. They found that compound check in the discovery studio software have best antidepressant activityand also exhibits good affinity for the 5-HT1A receptor. These findings can be useful in the design and synthesis of novel antidepressants.

Fathima Rizwana B and et al studied the molecular docking and binding structures on famciclovir and entecavir compound simulated from Discovery studio program. The geometric structures were optimizedand the band gap energies were calculated using software. Electrostatic Potential (ESP) maps identifies Negative and positive potential regions with help of software. Molecular docking studies confirmed the antiviral activity of the selected compounds.

Geethalakshmi Rajarathinam and et al uses discovery studio for docking of T. decandra with FabZ. They found that isolated flavonoid compound possess excellent anti-P. aeruginosa activity. The in-silico analysis of isolated compound shows possible action in a hypothetical way. The molecular docking of flavonoid was carried out using Discovery Studio.

Sugunadevi Sakkiah and et al developed 3D pharmacophore model based on the known inhibitors. This Pharmacophore model was generated using HYPOGEN algorithm in discovery studio program. From the molecular docking studies around 36 compounds were obtained based on consensus scoring function and selected as HSP90 inhibitors.

The aim of Ran Joo Choi and et al was to evaluate the anti-Alzheimer's disease activities of selected ginsenosides. They use the docking software to check thepotential of ginsenosides in the development of therapeutic agents for Alzheimer's disease. They predict binding energies of the ginsenosides with β-site amyloid and obtained result were corelated with in vitro activity.

Nafees Ahmed and et al use discovery studio for synthesis of tricyclic guanidine derivatives and biological evaluation against P. falciparum. The docking studies show that there is very strong correlation between in silico and in vitro results. Based on the data obtained by software, more potent inhibitor against P. falciparum can be designed. Docking was performed using DS program to understand the mechanism of inhibition and to identify pharmacophore required for anti-malarial activity.

Prashant Bhardwaj and et al uses DS program for identification of novel proteintargets for triclosan. They conduct the inverse virtual screening study for protein targets. A text mining study of triclosan was initially performed to find outinteraction in various biochemical processes.

Amer Hosny and et al use the software for development of a predictive model to identify potential HIV-1 attachment inhibitors. They performed the study in two phased computational process to identify useful compounds capable of binding to the protein for therapeutic purposes using the Discovery Studio docking and screening software.

Mohammad Heiat and et al conduct the study in docking program to analyze isolated ssDNA aptamers against angiotensin II. They found that the structural and sequential homology between aptamers can be considered as a sign of similar characteristics and Output PDB files were modified from RNA to DNA in the discovery studio visualizer software. The in-silico study was performed and uses to find aptameric fragments binding potency.

Sagir Yusuf Ismail and et al performed in-silico QSAR study of sulfur containing shikonin oxime derivatives. The docking study also carried out between this derivatives and target protein. This study provides an approach for the design of more potent anti-colon drug. The data found to be match and correct with anti-cancer agent for colon cancer.

Shola Elijah Adeniji and et al use discovery studio software to molecular docking evaluation of selected quinoline derivatives. Discovery Studio software was used to visualized and analyzed the docked results. They found that activity of quinoline derivatives checked in software exhibits as best anti-tubercular agents.

CONCLUSION:

This study paved better understanding of Discovery Studio software for viewing, sharing, analysing protein and small molecule data. The DS program provides applications covering areas including molecular mechanism, molecular dynamics, quantum mechanics. Software also have ability to perform hybrid QM/MM calculations. It employed for small molecule and macromolecule applications. The molecular properties can found by editing structures and performing calculations.

ABSTRACT:
Molecular docking has been widely employed as a fast and inexpensive technique in past decades, both in academic and industrial setting. In current situation molecular docking software is very useful. It's a need of society. That's why this review is focused on docking. In that Autodock Vena by pyrx version is very useful software for literature. New approaches continue to be developed and value of published work grows at a rapid pace. In resend developments there will be increase in accuracy, time limite, advances in computing power to eventually accomplish the full potential of the area. This review precents the overview of the method and attempt to summerise recent developments regarding four main aspects of molecular docking approaches: bench marking set, Advances in consensus method, recent applications using, use of machine learning, algorithms in docking. This autodock vena software gives more information related to molecular docking by litareture survey.

KEYWORDS: Molecular Docking, Drug Discovery, Autodock vina by PyRx software.

INTRODUCTION:
Doking is on the front line of computational biology and drug discovery the explosion of structural and chemical information in recent years has rendered this use the computation approaches to discover developed and analyzed and similar biologically active molecules the computer aided drug discovery leads to virtual screen, energy calculations, ADME models and drug interactions this helps in scientists in minimizing the synthetic and biological testing.

Autodock vina in PyRx software is most prefferable software in the molecular docking. This software is important. The molecular docking approach can be used to model the interaction between small molecule and protein at the automic level allow as to characterize the behavior of small molecules in the binding site of target proteins as well as elucidate fundamental biochemical process. In drug discovery, protein –ligand or protein – protein. Docking plays an important role in predicting the orientation of the ligand. The ligand is searched in a six dimentional rotational or translational space to fit in the binding site.[1-3]

REVIEW OF ARTICLES:
Vina design philosophyis not to require the user to understand its implementation. Autodock is suite of automated docking tools. It is designed to predict how small molecules, such as substrates or drug conditions bind to recepter of known 3D structure. Autodock vina does not require choosing atom types and pre-calculating grid maps for them. Docking using autodock version 4.0 of PyRx software. PyRx is an open source software to perform virtual screening it is a combination of sevral software.

PyRx includes a docking wizard. Specific aspects for using PyRx as well as consideration for data preparation docking and data analysis also describes. Drug discovery is attractive research area that enables application of cutting edges biomedical research to improve health of man people by active components of natural origin have been under enormous investigation as potential studies that were performed by using PyRx docking tool through autodock vina software M. Venkateshan and Etal used autodock vina PyRx software to check inhibition activity of Azaphenantherena derivatives on or over SARS COV-2. This software to provid the guidance about inhibition activity of Azaphenantherena.[4]

Maryam Fatima et al used PyRx software to check bioactivity and docking of Synthesized ligand. the compound can serve as promising lead for the

6757 YASHODA TECHNICAL CAMPUS SATARA
DIRECTOR
Yashoda Technical Campus
Satara

development of new antifungal agents this software is used to check antifungal acivity this compound can serves as promising leads for the development of new antifungal agent.[5]

Usman Abdulfatai et al used to autodock vina verion 4.0 of PyRx software to check activity relationship study of anti-convelsant activity of aminobenzothiazole of their quantitative structure. This software is useful to provide guidance about activity of anti-convalsant.[6]

Usman Abdulfatai et al used autodock vina of PyRx virtual screening software to, molecular docking and quantitative structure activity relationship studies were carried out and 37 anticonvalsant compounds to develop a robust model for the prediction of anticonvalsant activities against gama aminobutyric acid aminotransferase this softare is useful to analyses of a few aminotransferase inhibitor activity.[7]

Ritika Srivastava et al used PyRx software to check a alkylated benzimidazol: designed, Synthesis, Docking, DFT analysis ADMET property activity against HIV and YFV. Series of Alkylated Benzimidazol derivatives was synthesized and screened for their anti-HIV, anti-UFV and broad-spectrum antivirus properties. The software useful to show excellent inhibitory property against the yellow fever virus with.[8]

Muhammad Baba Muh'd et al used PyRx software to study of anti ulcer activity of quinozolinone derivatives of quantitative structure activity relationship by using this software is useful to provide anti ulcer activity. this anti ulcer agents exhibiting good action against the receptor (H/K Atpase).[9]

Titilayo Omolara Johnson et al used autodock vina PyRx software to a ulcerative colitis is an implamation of the colon that can progress colorectal cancer if left untreated no medication completely cures ulcerative colitis and natural products are source of alternative approaches the anti imflamatory potential of phyllanthus nivosus leaf as a natural remady and as a source of new drugs against ulcerative colitis is validated.[10]

Mohammad Abdul Mumit et al used PyRx to study on vibrational and electronicspectra analysis of benzyl-3-N-(2,4,5-trimethoxyphenylmethylene) hydrazine. The absorption, distribution, metabolism, excreation and toxicity investigation predicted that tne compound has good drug like character.[11]

Mohamed Elbadawi et al used PyRx to virtual drugs screening revealing an oxofluorenyl benzamyd and bromonaphthalene sulfonamide hydrobenzoic acid compounds induced apoptosis in a dose dependant manner as analyzed by flow cytomery this two compounds binds to HDAC6 an inhibites its function and exerts cytotoxic activity by apoptosis induction this software used to HDAC6 inhibit.[12]

Shola Elijah Adenji et al used PyRx software to investigating and evaluating some active compounds as potent anti-tubercular agent against MTB CYP121 recepter this. This whole docking result against MTB CYP121 receptor provide a valuable approach for structure based design.[13]

Rina Herowati et al used to PyRx software to studies of chemical constituents of tinos spara cortifolia on glycogen phosphorylase. These software used to give the activity of glycogen phosphorylase in the liver and widely used in the treatment of diabetis mellitus.[14]

Abhay Jaiprakash Gandhi et al used to PyRx software to study the drug for management of SARS-COV2 with ayurvedic perspective along with silico study. The molecular docking and grid were generated this PyRx software of autodock.[15]

Nanda Kumar Yellapu et al used to PyRx software to study the modeling, molecular docking, probing catalytic binding mode of acetyl-CoA malate synthase G in brucella melitensis. The core domain pocket of MSC catalytic residue. these ligand leads could be the best prospective inhibitors to treat brucellosis. These software is useful for activity.[16]

Sabitu Babatunde Olasupo et al used PyRx software is the antidepressant properties in inhibition of serotonin transporter has been considered to be a good target for the treatment of mood disorders. the phenyl piperidine derivatives as inhibitors of serotonin transporter cheminformatics and molecular docking. this software is used to check the antidepressant activity.[17]

Aliyu Wappah Mahmud et al used Autodock vina PyRx software to the quantitative structure activity relationships provides a model that link biological activities of compound to their chemical structures and molecular docking study reveal the interathction between drug and it target enzyme. In this software to check the activity of antiplasmodium hybrid compound.[18]

Adedirin Oluwaseye et al used autodock vina in PyRx software to check on anticonvulsant activity of isoxazole and thiazole derivatives active in animal model. This software useful to provide the information about active in subcutaneous pentylenetetrazole in animal model.[19]

Aliya Nur Hasanah et al used Autodock vina in PyRx software is useful to extraction of atenolol from spiked

DIRECTOR
Yashoda Technical Campus
Satara
YASHODA TECHNICAL CAMPUS SATARA

blood serum using a molecularly imprinted polymer sorbent obtained by precipitation polymerization is the Atenolol is cardio- selective B-blocker that is used in the Treatment of hypertension over extended periods. in this software is to check activity of extraction of atenolol fom spiked blood serum in polymerization.[20]

CONCLUSION:

This is an open source software. Autodock vina in PyRx is virtual screening software for computational drug discovery that can be used to libraries of computer against potential drug targets. Using this Autodock vina in PyRx software fordocking the several ligands against one macromolecule. This molecular docking software predicted the activity.

This softeare is useful for the literature. In this software is essential for research of molecular docking. It is inexpensive, time consuming process, it gives accurate result.

ABSTRACT:
The process of drug development and drug discovery is very challenging expensive and time consuming. It has been accelerated due to devlopment of computational tools and methods. In current situation lots of molecular docking software are available in the market, during lirerature survey it was found that Discovery Studio is suit of software for stimulating small molecule and macromolecule system. It is developed and distributed by Accelarys. It helps to Investigate and test hypothesis in silico prior it costly experimental implimentation thus reducing the time and expense involved in bringing products to market. it is developed and distributed by Dassault system BIOVIA (formerly Accelerys). During literature survey it was found that Discovery Studio software was efficiently guided to as author regarding mainly biological activities like anti-inflammatory activity, anti-tubercular activity, anti-bacterial activity, anti-viral activity, anti-diabetic activity and anti-oxidant activity.

KEYWORDS: Molecular docking, Drug discovery, Discovery studio.

INTRODUCTION:

Molecular docking is one of the most frequently used methods in structure based drug design, due to its ability to predict the binding- confirmation of the small molecule ligands to the appropriate target binding site. Discovery and development of a new drug is generally known as a very complex process which takes a lots of time and resources. So now a days computer aided drug design are used very widely to increase the efficiency of the discovery and development courses. CADD are evaluated as promising technique according to they need, in between all these structure – based drug design and ligand – based drug design. As very efficient and powerful technique in the drug Discovery and development. These both methods can be applied with molecular docking to the virtual screening for lead identification and optimization. Molecular docking is a key tool in structural molecular biology and computer assisted drug design.

Discovery studiosoftware is suit for stimulating small molecule and Macromolecule system. The product suite as astrong academic collaboration programme, supporting scientific research and makes use of a number of software algorithms developed originally in the scientific community, including CHARMM, MODELLER, DELPHI, ZDOCK, DMol3 and more [1-3].

REVIEW OF LITERATURE:

Qinggang Meng and et al used Discovery Studio Software check the Rizoma Atractylodis and Rhizoma Atractylodis Macroephalae herbal pairs against type 2 diabetes mellitus. the interaction between targets and ligands were observed and analayzed, according to CDocker interaction energy, most compounds from the herbal pair had good binding activities with receptor and nine compounds had even higher scores than those of the original ligands [4].

Shola Elijah Adeniji and et al used Discovery Studio stimulated Software to check the Anti tubercular modeling, molecular docking stimulation and insight toward computational design of novel compounds as potent antagonist against DNA gyrase receptor. Tuberculosis continue to be critical health problem causing death and illness among millions of people yearly and ranked the second leading cause of mortality

YASHODA TECHNICAL CAMPUS 6757 SATARA

among the communicable infections in the world. This work accessed the application of modelling technique to predict the inhibitory activity of some prominent compounds which been reported to efficient against mycobacterial tuberculosis [5].

Sabir Ali and et al used Discovery Studio4.0 accelrys Software to check anti bacteriak, anticancer, and molecular docking studies of macrocyclic metal complexes of dihydrazide and diketone. this studies suggest an octahedral geometry for all complexes, compounds found active against B, Substillis and S,aureusand P, aeruginosa and E.coil bacteria, Zn (II) complex showed significant anticancer activity against squamous cell carcinoma cell tested by MTT assay method. Molecular docking studies with EGFR tyrosine kinase were also carried out . all these results show that some of synthesized compound have remarkable antibacterial and anticancer property [6].

Mehmet Gokhan Caglayan and et al used Discovery Studio Software to check the Electrochemical ,Spectroscopic and molecular docking studies of the insteraction between the anti –retroviral Indinavir andds DNA in this study electrochemical and DNA biosensor was developed using a straightforward methodology to investigate the ineraction of indinavir with calf thymus double –stranded deoxyribonucleic acid for the first time. The obtained results can offers insights into the inhibitory activity of indinavir, which could heip to broaden its application, thus indinavir can be used to inhibit other mechanisum and /or hallmarks of viral diseases [7].

Dominic Agyei and et al used discovery studio software 2019 to study physicochemical characterization and drud likeness evaluation of hypotensive peptides encrypted in flaxseed proteome.in this study, hypotensive peptides derived from mature flaxseed protein sequences were predicted in silico using BIOPEP-UWM with nine protease, three each form digestive, plant and microbial sources. In silico prediction of adsorption, digestion, metabolism, excetion and toxicity (ADME/Tox) profile based on physiochemical properties and Lipinski's rule of five showed that the peptides were non toxic and had desirsble drug like properties [8].

Shola Eljiah Adenjiand et al used Discovery Studio stimulated Software to check Quantum modeling molecular and evaluation of some selected quiniline derivative as antitubercular agents: discovery studio visualize software. Ligand - receptor interaction between quinoilne derivatives and the receptor (DNA gyrase). Docking study indicates that compounds 10 of the derivative with promising biological activity have the ulmost binging anti- tubercular drugs with more efficient activities [9].

Nasser Abdulatif Al- Shabib and et al used Discovery studio 4.0 software to investigate the effect of food additive dye "tartrazine" on BLG fibrillation under invitro condition. Molecular docking results ascertained that Tz binds at the hydrophobic cavityand interact with the key amino acid residues involved in the interaction with different ligands, the spectroscopic,microscopic and computational results electrostatic as well as hydrophobic interaction played a very important role in Tz–induced BLG fibrillation under invitro condition [10].

Jian Wang and et al used Discovery Studio Software to study Graphene/Feso4 namocomposite for effective removal of ten triazole fungicides from water solution . Tebucanazole as an example for investigation of the adsorption mechanism by experimental and molecular doking study. The study on adsorption kinetics and thermodynamics were done by taking tebuconazole as an example. Grapheme/Fe_3SO_4 was prepared and utilized as a adsorbent for removal of ten commonly used triazole fungicides in agriculture [11].

Deepu Mathew and et al used Discovery Studio V4.0 Software to check therapeutic molecule for multiple human diseases identified from pigeon pea (Cajanus Cajan L. Millsp) through GC- MS and molecular docking molecular mechanism behind the therapeutic potential of pigeon pea over the human disease such as rheumatoid arthritis, breast cancer, type II diabetes , malaria, measlesand sickle cell disease were revealed through GC-MS identified phyto – compound ligands with candidate protein [12].

Asif Husain and et al used Discovery Studio Software (version4.0,Accelryssoftware) check the molecular docking with COXI and II enzyme, ADMET screening and in vivo anti– inflammatory activity of oxadiazole, thiadiazole and triazole analogus of felbinae. Based on the core structure of felbinac drug, three series (4a-d,5a-d, 6a-n) of five membered heterocylic derivatives containing three heteroatoms were designed and synthesized starting from felbinac. The prepared molecules were the investigated for their anti-inflammatory, ulcerogenicity, and analgesic in experimental animal [13].

Maryam A. Jordaan and et al using Discovery Studio visualizer Software to check virtual screening and DFT calculation of FDA approved compounds similar to the non – nucleoside reverse transciptase inhibitor (NNRTI) efavirenz the compounds were subjected to screening by analyzing their drug likness, such as Lipinski's rule of

five and ADME properties. Study showed that lovastatin and simvastatin might be considered as lead compounds for further development for COVID -19 main perotease inhibitor [14].

Assia Belhassan and et al used Discovery Studio2016 Software to study novel triazolo- benzodiazepine analogues as antidepressant targeting by molecular docking and ADMET properties prediction. Docking studies suggested that eleven ligands interacted within activesiteof Drosophila melangaster dopamine transporter (Ddat)) (PDBED:4M48) [most ligands formeH-bond with amino acid phe43, Asp46, Asp475, Tyr123, Ser421 and Gln also exhibited Pi and Pi-Pi. In silico ADME evaluation of compounds shoed more than 96% intestinak absortion for all compound [15].

Mohommad k.Parvez and et al used discovery studio software to check plant derived antiviral drugs as novel hepatitis B virus inhibitors: Cell culture and molecular docking study. Docking of lamivudine indicatedstrong interaction with the modeled HBV pol active site residues that formed stable complex, similarly all the docked antiviral compounds formed very stable complexes with anti-HBV pol. Taken together,our data suggest the anti-HBV potential of thetested natural compounds as novel viral pol RT inhibitors [16].

Hanine Hadni and et al used to discovery studio software to check molecular docking andthe antimalarial activity of hybrids 4-anilino-qinoline-triazines derivatives with thewild-type and mutant receptors ofof-DHFR docking studies were performed for previously reported 4-aniloquinoline and 1,3,5-triazines based molecular hybrids. The docking result revealed that these molecular specifically with SER108 and 1LE164 in the pf-DHER binding pocket as that of best active compounds but also showed additional interactions with LEU40 and GLY44 [17].

Aliyu Wappah Mahmud and et al used discovery studio software check QSAR and molecular docking studies of 1,3,dioxoisoindoline-4-aminoquinoline as potent antiplasmodium hybrid compounds. The docking result indicates strong binding between 1,3-dioxosoindoline-4-aminoquinoline and plasmodium falciparum lactate dehydrogenase (PFLDH) ,and revealed the important of the morpholinyl substituent and amide linkerin inhibiting PFLDH. These results could serve as a model for designing novel 1,3-dioxoisoindoline-4-aminoquinolines as inhibitors of PFLDH with higher antiplasmodial activities [18].

K.Jayasheela and et al used discovery studio to check the conformational and spectroscopic characterization, charge analysis and molecular docking profiles of chromone-3-caboxylic acid using a quantum hybrid computational method. The spectroscopic profile of chromone-3-carboxylic acid (abbreviated as 3CA) was exmined using FT-IR, FT-roman,UV,1H and 13C NMR technique. Result of the docking study identified the sugar phosphate inhibitor activity of the target molecular (C3CA) [19].

Mariana Spetea and et al used discovery studio (version3.0) software to check structure activity relationship. Explorations of 14-oxygenated N-Methylmorphonan-6-ones as potent µ-Dpioid receptors against. The crucial role of relative orientation of the ligand in the u or binding site, influencing the property of critical non-covalent interaction that are required to facilitate ligand/-µ or activation by the 14-oxygenated N-methylmorphinan-6-ones,which should be useful for guiding drug design.

Shola Elijiah Adeniji and et al using Discovery Studio Visualizer software. To check the theoretical modeling and molecular docking stimulation for investigating and evaluatiny some active compounds as potent anti tubercular agents against MTB CYP 121 receptor. Docking studies revealed the best molecule with docking scores of–13.7 kcal/mol which formed H- bond and hydrophobic interaction with amino acid residue M. Tuberculosis cytochromes (MTB CYP 121) [20].

Shola Elijiah Adeniji and et al used Discovery Studio Visualizer software check the In silico study for evaluating the binding mode and interaction of 1,2,4-triazole and it's derivatives as potent inhibitors against Lipoate protein B (Lip B) research has shown that the binding affinity of these compounds wery found to be better than the recommended anti–mycobacterium drugs; isoniazid (-14.6kcal/mol) and ethambutol (- 5.8kcal/ mol). This study provide valuable approach for designing and synthesizing more potent anti–mycobacterium tuerculosis derivatives [21].

Ana- Maria Udrea and et al used Discovery Studio Visualizer software to check Laser irradiated phenothiazines: New potential treatment for COVID - 19 explored by molecular docking . In this study predict , using molecular docking, the binding affinity to 15 phenothiazines (antihistaminic and antipsychotic drugs) when interacting with the main protease SARS - coV-2 . Results reveal that thioridazine –and its identified photo products (mesoridazine and sulforidazine) have high biological activity on the virus main protease [22].

CONCLUSION:

This review totally focused on the drug designing in Discovery Studio software and it's different versions such as Discovery Studio V 4.0, Discovery Studio 2016,

DIRECTOR
Yashoda Technical Campus
Satara

Discovery Studio 4.0 Accelrys. This software also useful to check the various biological activities and therapeutic activities such as Anti -inflammatory, Anti- tubercular, Anti-diabetic and Anti- oxidant activity etc.

After literature review it was seen that number of researchers suggest Discovery studio software for protein – ligand interaction and the interaction between target and ligands were observed and analyzed.

REVIEW ARTICLE

Organization of Swiss Dock: In study of Computational and Molecular Docking Study

Neha Subhash Patil*, Sachin H. Rohane
Department of B. Pharmacy at Yashoda Technical Campus, Satara.
*Corresponding Author E-mail: **nehap2761@gmail.com**

ABSTRACT:
In the present era, many fields of research are showing great importance. Apart from the applications researchers have grown their interest in pharmaceutical application. Protein play and important side in study of various in - vitro and in - vivo studies to understand the action of drugs. Docking programs have a wide range of applications ranging from protein Engineering to the drug design. Swiss dock software was guide to authors to predict the molecular interactions that may occur between a target protein and a small molecule. After review it was analysed that Swiss dock are organised for UV-VIS spectroscopy, Synthesis, crystal, structures, etc. This article presents Swiss Dock, a web server dedicated to the docking of small molecules on target proteins. It is based on the EADock DSS engine, combined with setup scripts for curating common problems and for preparing both the target protein and the ligand input files. An efficient Ajax/ HTML interface was designed and implemented so that scientists can easily submit dockings and retrieve the predicted complexes. For automated docking tasks, a programmatic SOAP interface has been set up and template programs can be downloaded in Perl, Python and PHP. The web site also provides an access to a database of manually curated complexes, based on the Ligand Protein Database.

KEYWORDS: Molecular Docking, Swiss Dock, Drug Discovery.

INTRODUCTION:
Molecular docking is prediction of the binding affinity To achieve an optimize Conformation for both receptor and ligand and relative orientation between protein and ligand such that the free energy of the overall system minimized Molecular docking is one of the most frequently used methods in structure based drug design, due to its ability to predict the binding conformation of Small molecule ligands to the appropriate target binding site. Molecular docking has become an increasingly important tool for drug discovery Programs based on different algorithm were developed to perform molecular dockings studies which have made docking an increasingly important tool in pharmaceutical research.

Received on 07.11.2020 Modified on 24.11.2020
Accepted on 15.12.2020 ©AJRC All right reserved
Asian J. Research Chem. 2021; 14(2):145-148.
DOI: 10.5958/0974-4150.2021.00027.4

The aim of molecular docking is to give a prediction of the ligand-receptor Complex structure using computation methods Swiss Dock a web Service to predict the molecular interaction that may occur between target protein and a small molecule many binding modes are generated either in a box or in a vicinity of all target cavities [1-3].

Computer aided Drug Design:
Drug design depends on knowledge of 3D structures of biomolecules that is known as structural aided drug design. in addition to small molecules biopharmaceutical induces peptides and especially therapeutic antibodies are increasingly important doss of drug and computational method for improving affinity selectivity and stability been developed.

Most docking programs are Complex computational machineries and require specific additional Sampling or Scaring parameters to which they might be very sensitive while convenient default values are often a proposed good understanding of the user manual and the original

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

article is always required in order to achieve meaningful prediction.

Swissdock:

Swiss Dock is the docking web server that addresses limitations described above. Well a the structure of the target protein, as well as that of the ligand, can be automatically prepared for docking. Allcalculation performed on the server side, so that docking runs do not require any Computational power from the user.

A target protein structure can be determined either by specifying its identifier from the protein data Bank. Since the calculation are performed in the CHARMM force field, Swiss dock Supports the uploading of CHARMM. Formatted files in addition to the Commonly used PDB format protein Structure can be uploaded as a set of protein structure file, Coordinate file and extra topology and parameter files if needed. Once the target protein structure has been defined it is immediately prepaid for used with CHARMM, and the Curated structure can be downloaded and reviews prior to the docking assay if needed. The performance of the backend of Swissdock was assessed by a blinding docking assay on 251 test Complexes taken from the ligand protein Database with different presents available from the web interface. The performance of Swiss Dock depends on the number of free dihedrals of the ligand.

Influence of the flexibility of the success rate observed with SwissDock the docking engine of SwissDock redocking assay Carried out on 251 protein ligand Complex.

Table No. 01

Max No. of routable bond of the Ligands	FDA Approved Drug (in %)	SR0 (%)	SR5 (%)
5	63	84	93
10	93	77	86
15	99	69	83
20	100	66	81

The fraction of the surface of the ligand which becomes buried upon complexation also has Significant effect the higher this fraction, the easier it is for Swiss Dock to identify the binding pocket, and therefore to dock the ligand inside.

Table No. 02

Influence of the fraction of the Ligand which is buried upon complexation (% BS) on the same data set.

Min % BS	SR0 (%)	SR5(%)
95	82	95
90	70	85
85	66	80
80	62	75

Swiss Dock Input Files

- Since docking assays are carried out in the CHARMM 22 /27 all-hydrogen force field.
- Target proteins and ligands that have been uploaded as CHARMM- Formatted files Can be used.
- Protein and ligands that have been submitted in PDB or be mold to format respectively have to be Converted prior to the docking itself.

Computer Aided Drug Design:

Simply rational design is the inventive process of finding new medication based on biological target the drugs are commonly organic small moleculesthats activates or inhibits function of biomolecules such like a protein. That is further give the therapeutic action to the patient. Basic in that isdrug design means the invole in molecules that complementry in shape and size of biomolecules. They bind with each other and form the bond. Drug design not relies on computer modelling. this type of modelling callled as computet aided drug design. Drug design depends on knowledge of 3D structures of biomolecules that is known as structural aided drug design. in addition to small molecules biopharmaceutical indudes peptides ans especially therapeutic antibodies are incresingly important dass of drug and computational method for improving affinity selectivity and stability been developed.

Drug design also known as efforts to develop a new drug by molecular modification of lead compound for optimization of desired efferts and minimization of side effects.

- **Web interface Inputs:**

Only three steps are required to start a docking assay through the web interface of SwissDock: users must define a protein structure, one or several putative ligands and docking parameters. They are guided throughout this short and simple submission process by a comprehensive contextual help. As mentioned above, several sample files are supplied to users and can be directly uploaded into the form simply by clicking on a link. The corresponding sample output files are also provided.

- **Target selection:**

A target protein structure can be determined either by specifying its identifier from the Protein Data Bank (15) or by uploading structure files. The first option allows users who are not familiar with 3D structure files to start a docking assay with only a PDB code. If several PDB records are available for the same target, those with a high resolution and a ligand similar to the one that will be docked should be considered first.

DIRECTOR
Yashoda Technical Campus
Satara

- **Ligand selection:**

A ligand can be selected either by specifying its identifier from the ZINC database (23) or by uploading structure files. The former possibility allows users who are not familiar with 3D structure files to start a docking assay with only a ZINC accession code (AC). The latter allows uploading several ligands at once or uploading ligands that are not present in the ZINC database. As for the target protein, SwissDock not only supports the widely used Mol2 format, but also the direct upload of CHARMM input files describing the ligand.

Review of Litreture:

Sabrin R. M. Ibrahim and Khalid Z. Al-shaliand et al used SwissDock ADME for Molecular Docking studies of the tested metabolites estimated to shade up rational explanation of α – amylase inhibitory activity result the pharmacokinetic parameter [4].

Mohammad Kabrineand et al used SwissDock in article to investigate the possible mechanism by which selected drugs act an silico theoretical molecular docking approach was used, during this study they stimulated the binding mode of N3 against 6lu7 crystal structure using SwissDock to ensure the effectiveness of Dock result and to compare result produced by several drugs to those of N3 [5].

Kerry A. Ramshottom et al used SwissDock programme to investigate that if the software cooled accurately dock the abacavir back into the crystal structure for the protein arising from the known risk allele and if the software is able to distinguish between the HLA-associated and known HLA associated allele [6].

Long Ding and et al used SwissDock software to discover Bioactive peptide silico method peptide would be experimental in-vitro to identify the activity [7].

Dae Hawn-Kim and et al used SwissDock stimulation analysis of unbiased blind docking it was determined the top score predicted blind side for SGI-1027 and M\M to localize the binding region on PrP. The result indicates CHI-1027 interacted with and regions on PrP [8].

Jesus Campagna and et al used SwissDock for evaluation of an Allosteric BACE inhibiter peptide to identify mimetic that can interact with the loop and region of the Enzyme and prevent APP cleavage and to elucidate the mechanism of peptide 65007 allosteric inhibition in silico experiment were performed first by conducting molecular docking in SwissDock with 65007 and comparing the model to crystal structure of the genetech Ab and BACE [9].

Layla K. Mahdi and et al used SwissDock experiment with GlpO model and its Ligands shows surface representation and the carbo-hydrate ligands as sticles. A predicted binding modes for LNT with a surface representation of GlpO model [10].

ElahelKashoni – Amin and et al used SwissDockfor the active site celef is quite extended, some poses were found to occur for the ligand in this location, However a second putative interacting site was found that is located in the entrance of the central beta-barrel of the enzyme. It should be seen that this location was detected by Swiss Dock [11].

Kankana Das and et al used SwissDock in compatible lipid lingad was then docked with proteins that are available as original PDB files were SwissDock interface the results were viewed and analysed [12].

Flavia S. Darquiand et al used SwissDock for putative KpFat A and KpFatB protein structure when moldedbu using homology modling using the Swiss model workspace. Based on their sequence the semi-colum zero-Acpthioesterace crystal structure from G. Californica as a term plate and default primary parametaFurthemore molecular docking was performed [13].

Christina E. Smith and et alused SwissDock for performing the docking of NSAIDs with Capase-3 was performed [14].

Jamal Quazzaniand et al used SwissDock in Silico studies for the docking of GP269, target was prepared from the X-ray protein structure of the crystalized complex. Polar hydrogen atom were added to the protein, The docking of GP269 into the structure of Tb6PGL was performed using the Swiss Dock [15].

CONCLUSION:

From Reviewing the above literatures, it was found that the Swiss Dock Software is used to predict the molecular interaction that may occur between a target protein and a small molecule.

The Swiss Dock web server aims at providing a wide scientific community with a free and user-friendly, yet stateof-the-art protein/small molecule, docking tool. The automatic setup of protein and ligand structures, the different parameter presents and the convenient visualization and analysis of docking predictions makes it accessible to a wide audience. The EADock DSS engine behind SwissDock is especially suited for drug design, with very good success rates for small and relatively rigid ligands with less than 10 flexible rotatable bonds: the most favourable predicted BM is

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

found within 2 A˚ to the crystal structures for 77% of the 251 test complexes, and for 86% of them, such a correct BM is found within the five most favourable ones. This performance is even increased if the ligand can be buried in a well-defined binding site of its target protein.

Acute Toxicity Study and Anti-Nociceptive Activity of Ethanol Extract of *Aesculus Indica* Seeds on Experimental Animal Models

Priyanka R. More*, Atish B. Velhal, Vitthal J. Chaware, Vivek Kumar K. Redasani

YSPM's Yashoda Technical Campus, Wadhe, Satara, MS, India.

ABSTRACT

Aesculus indica, widely known as the horse chestnut tree, has long been used as antiangiogenic, antibacterial, antidiabetic, antiviral and antifungal. Ttraditionally it has been used as medicine for the treatment of skin diseases, rheumatism and different pain conditions. The current study was undertaken to investigate possible effects of ethanol extract of seeds of plant in experimentally produced pain in animals because there were no scientific publications on the use of *Aesculus indica* seeds for anti-nociceptive activity. Preliminary phytochemical screening revealed the presence of flavonoids, tannins, carbohydrates, Saponins, and phenolic substances in the extract. The OECD guideline 423 was followed for acute toxicity testing.At a dose of 2000 mg/kg, the extract was confirmed to be safe. The anti-nociceptive effect of three distinct dose levels of extract (100, 200, and 300 mg/kg) was tested in Swiss albino mice using a hot plate, tail immersion test, and acetic acid induced writhing. Extract had strong anti-nociceptive efficacy (P < 0.001) in a hot plate test. The extract significantly increased the tail withdrawal reaction in the tail immersion test (P < 0.001).The extract considerably reduced the number of writhes in the acetic acid writhing test (P < 0.001). The findings indicate that the extract has substantial anti-nociceptive effect.

Key Words-Anti-nociceptive, Acute toxicity, *Aesculus indica*, Phytochemical screening.

INTRODUCTION

Pain is more than just a vexing sensation; it is a complicated sensory mechanism. Pain is caused by the activation of nociceptors at peripheral nerve terminals in response to tissue injury, which results in the release of a range of chemicals that change the local environment and cause pain.[1] Many pathological aches progress due to inflammatory responses in the central and peripheral nerve systems.[2] When nociceptive signals from the peripheral nerve system to the brain are regulated, pain is usually felt. In reaction to tissue injury or stimuli, a variety of chemicals such as histamine, bradykinin, and prostaglandins are released, resulting in nociception.[3]Also implicated in nociception are endogenous opioid and cannabinoid receptors[1]. Treatment of pain in chronic inflammatory disorders such as rheumatoid arthritis is a major issue for clinicians and the general public, as chronic use of current synthetic medications has dangerous side effects that cannot be ruled out. This needs the creation of a new nociceptive agent that is both safe and effective in eradicating or minimising unwanted effects. Herbal medications are used in several developing countries, despite the fact that they are not documented in science. Traditional folk remedies are used by about 80% of the population in some developing nations.[4]Pain has traditionally been treated using a variety of herbal medicines. Phytoconstituents have been scientifically verified for anti-nociceptive action.[5-8]The seeds of *Aesculus indica* (Family –Sapindaceae) arerich in saponins most specifically aescin.[9] Aescin has been reported to have anti-nociceptive activity via inhibition of oxidative stress and inhibition of prostaglandins.[10] Additionally with saponins*Aesculus indica*also contains flavonoids and tannins it may show anti-nociceptive activity. Moreover Anti-nociceptive activity forextract of *Aesculus indica* leaves has been reported in the literature.[11] Hence the

DIRECTOR
Yashoda Technical Campus
Satara

present research work was aimed to evaluate anti-nociceptive activity for ethanol extract of *Aesculus indica* seeds in experimental animal models.

MATERIALS AND METHODS

Drugs and reagents

Aspirin was purchased from USV Pharma, Mumbai, India and pentazocine was purchased from Themis medicare Ltd., Haridwar, India. All chemicals and reagents used for the experiments were of analytical grades.

Collection and authentication of plant material

Seeds of the *Aesculus indica* were procured from Royal Rifco Company, Shrinagar, India.After collection seeds were cleaned, washed to remove any dirt, dust and foreign particles. Botanical identity of plant specimen was authenticated by Dr. S. A. Mohite,Head, Department of Botany, Lal Bahadur Shastri College, Satara (MS), India.A voucher specimen of theseeds has been deposited in the department for future reference.Theseeds were coarsely powdered and further utilized for preparation ofethanol extract.

Preparation of ethanol extract

The ethanol extraction of seeds of *Aesculus indica* was carried out by soxhlet apparatus. The seeds were crushed and ground to powder and placed into extractor. The ethanol was poured on powder with three cycles. After that extraction process was started and continued till appearance of solvent in syphon tube turns brown to clear. Then brown colored solvent mixture from round bottom flask was collected and evaporated with the help of rotary evaporator to get a solid residue. The residue was placed in a vacuum desiccator and was further used for the experiments.

Prelminary phytochemical screening:

Prepared ethanol extract was subjected to preliminary phytochemical screening for presence of Alkaloids, Glycosides, Carbohydrates, Phenolic compounds, Flavonoids, Saponins, Reducing sugars.[12,13]

Experimental animals

Swiss albino mice (18–25 g) were provided byYashoda Technical Campus, Faculty of Pharmacy, Wadhe. Satara. Animals were housed and maintained according to standard guideline and procedures with animal facility at relative humidity 75 ± 5% temperature 22 ± 2° C, and a 12 h light/dark cycle. Animals were provided with standard diet and purified water ad libitum. Mice were allowed to acclimatize to the environment for seven days before start of the animal study. The experimental protocol was approved by Institutional Animal Ethics Committee. All the animal experimental procedures were performed according to the National Institutes of Health (NIH) guidelines on handling of experimental animals.

Acute oral toxicity study

The acute oral toxicity was performed as per the Organization for economic co-operation and development (OECD) guideline 423.[14]Acute toxicity study was performed in Swiss albino mice. The animals were grouped with three numbers in each. Ethanol extract of *Aesculus indica* seeds was given to animals with starting dose 300mg/kg in 0.1% CMC for first group.

According to observations of first group, study was carried out further on next group with dose 2000 mg/kg. From obtained results it was clear that no death as well as no toxicological signs in animals so, for confirmation of safety of extract study was repeated with dose 2000mg/kg on third group. After administration of extract, animals were observed carefully for first 30 min. and periodically for 24 h with special attention during first four hours. Animals were further observed daily for subsequent 14 days. Effects such as changes in skin fur, eyes and mucous membranes were observed daily. Also the circulatory, autonomic, respiratory, and central nervous systems, behaviour pattern and somatomotor activities were observed during study. Animals were further observed for salivation, diarrhea, tremors, lethargy, convulsions, sleep, and coma. The parameters like body weight, food, and water intake were checked periodically every two days.

Anti-nociceptive activity:

The anti-nociceptive activity of ethanol extract was tested using different animal models namely hot plate, acetic acid induced writhing and tail immersion test. Doses of extract were selected based on results of acute toxicity study.

Healthy Swiss albino mice (18–22 g) were used for the study. Animals were divided into five groups of six in each. Group I was control and received 0.1% CMC, group II was received standard drug, group III, IV and V were received ethanol extract of *Aesculus indica* seeds with low, medium and high dose by oral route.

Evaluation parameters

Tests were performed on same animals after 14 days washing period.

Hot plate test

Analgesic activity in mice was executed according to the method described previously.[15,16] The hot plate analgesiometer (IITC, USA) was used to determine the analgesic activity of ethanol extract of *Aesculus indica* seeds. Animals were divided into five groups of six in each. Group I received vehicle i.e 0.1% CMC by oral route, group II received standard drug pentazocine 17 mg/kg by intraperitoneal route, group III, IV and V were received ethanol extract of *Aesculus indica* seeds 100mg/kg, 200mg/kg and 300mg/kg respectively in 0.1% CMC solution by oral route.

Animals were placed on hot plate at different time points (0, 15, 30, 45, 60, 90 and 120 min) after administration of standard drug pentazocin, extract and vehicle, time require for first response (flickering or licking of hind paw or jumping) has been measured. Hot plate was maintained at 55 ± 0.5 °C and cutoff time fixed for 15 sec. to avoid tissue damage.

Acetic acid induced writhing test

The acetic acid induced writhing test was performed as described previously using 0.1 ml of 0.6% v/v acetic acid solution in normal saline.[17,18] Swiss albino mice (18–22 g) of either sex were divided into five groups of six in each.

DIRECTOR Yashoda Technical Campus Satara

Group I received vehicle i.e 0.1% CMC by oral route, group II received standard drug Aspirin 30 mg/kg by oral route, group III, IV and V received ethanol extract of *Aesculus indica* seeds 100mg/kg, 200mg/kg and 300mg/kg respectively in 0.1% CMC solution by oral route. Thirty minutes after administration of standard drug Aspirin and test extracts, 0.1 ml of 0.6% acetic acid were administer via intra-peritoneal route. The number of writhing will be counted for 20 minutes after administration of acetic acid. The percentage inhibition of writhing has been calculated.

percentage inhibition of writhing = (C – T / T) x 100

Where C- Average number of writhes in control group.

T- Average number of writhes in test group.

Tail immersion test

The tail immersion test was carried out in Swiss albino mice (18–22 g) according to method described by previous researchers.[19,20] Animals were divided into five groups of six in each. Group I received vehicle i.e 0.1% CMC by oral route, group II received standard drug pentazocine 17 mg/kg by intraperitoneal route, group III, IV and V were received ethanol extract of *Aesculus indica* seeds 100mg/kg, 200mg/kg and 300mg/kg respectively in 0.1% CMC solution by oral route. Animals were adapted for restrainer 30 min. before study leaving the tail hanging out freely. After administration of standard drug pentazocine, extract and vehicle, the tail immersed in hot water (Temperature 55 ± 0.5° C) and the reaction time require for removal of tail has been recorded as response. The cutoff time for tail exposure to hot water fixed to 15 s. The response was recorded at 0, 15,30,60,90,120 and 180 minutes after administration of dose.

Statistical Analysis

The data presented as a mean ± SD (Standard Deviation). Two way ANalysis Of VAriance (ANOVA) was used to make comparisons between the treated groups. The level of statistical significance was set at $P < 0.001$.

RESULTS

Preliminary phytochemical analysis:

Table 1.Shows the findings of qualitative analysis of *Aesculus indica* seeds extract. According to the obtained resultscarbohydrates, saponins, tannins, flavonoids were found to be present in extract.Alkaloids, glycosides, amino acids, steroids and terpenoids were found to be absent.

Table 1. Qualitative analysis of the phytochemicals inseeds extracts of *Aesculus indica*.

Acute toxicity study

The acute toxicity study began with a 300mg/kg starting dose. During a 14-day observation period, oral administration of a 300 mg/kg dosage of ethanol extract of *Aesculus indica* seeds caused no significant toxicity. From above results it is clear that given dose was safe and hence further study was performed by administering 2000mg/kg dose of extract to next group of animals. There were no indicators of toxicity and mortality [Table 2.], as well as the animals' morphological characteristics and general appearance did not change. There was no salivation, diarrhoea, tremors, convulsions, lethargy or unusual behavior observed during study in treatment group. When compared to control group mice, extract-treated animals did not demonstrate any significant changes in body weight, food and water intake [Table 4.]. For further confirmation of results effect was checked by giving same dose (2000mg/kg) to another group of three animals and results

DIRECTOR Yashoda Technical Campus Satara

were repeatedly same. Table 3, shows the parameters measured before and after the test extract of *Aesculus indica* seeds. According to results even at the highest dosage of 2000mg/kg body weight of the test animal, all parameters were normal. The oral LD_{50}could be over 2000mg/kg body weight. As a result, greater dose testing of the extracts may not be necessary, and the extracts were practically non-toxic.

Antinociceptive Activity:

Hot plate test:

The effect of ethanol extract of *Aesculus indica*seeds is represented in Table 5. Extract significantly delayed the response dose dependently at doses 100, 200 and 300 mg/kg between 15 and 120 min after administration of extract when compared to control group. At dose 300 mg/kg showed maximum response at 45 min with response time 8.80 ± 0.14 ($p < 0.001$) when compared with control group (3.05 ± 0.18). The standard drug pentazocine showed maximum response at 30 min with reaction time 10.03 ± 0.17 ($p < 0.001$) when compared with normal control animals (3.2 ± 0.30).

DISCUSSION

For centuries, medicinal plants have been utilised to treat human illnesses. The active compounds are mostly responsible for the crude drug's biological activity. However, evidence-based scientific research on the biological activity and toxicity of medicinal herbs are limited. The findings of this study revealed that the *Aesculus indica* seeds extract contained carbohydrates, saponins, tannins, and flavonoids [Tab.1]. These secondary metabolites produce a definite physiological action on the human body.[21-27] Toxicity data aids in determining the maximum dose of a substance that can be safely utilised in animals and humans. There were no reports on the toxicity of *Aesculus indica* seeds extract. As a result, the current investigation began with acute toxicity of the extract at a dose of 300 mg/kg and then progressed to a dose of 2000 mg/kg after obtaining satisfactory results. During 14 days of treatment with a single dose of *Aesculus indica*, there was no death. There was no substantial change in body weight, food, or drink intake, safety of extract.No symptoms of toxicity were noticed at the limit dose throughout the investigation, indicating that it was well tolerated. The findings indicated that the extract is safe to use.

The central mechanism of analgesic action of the extract was evaluated using hot plate and tail immersion techniques.To measure central anti-nociceptive activity, the tail immersion and hot plate tests are standard and very sensitive assays. With this nociception models, the extract showed substantial action. It is well known that centrally acting analgesics raise the pain threshold of mice when they are exposed to heat.[28] These tests are important in determining whether or not a heat induced nociception is present and whether or not narcotics are involved.[29] The hot plate test is very sensitive test to determine central anti-nociceptive activity. It involve neuronal signaling pathways to respond thermal stimuli.Supraspinal reflex is elicited by hot plate method. The substances, which increases the reaction time against heat stimulus, act centraly to mimic pain.[30]*Aesculus indica* (100, 200 and 300 mg/Kg) prolonged the latency period in hot plate model and tail withdrawing time as that produced by pentazocine, a standard analgesic drug indicating the centraly mediated anti-nociceptive activity.

Both tests use neural signalling pathways to respond to heat stimuli and are linked to central activity.[31] As a result, these tests were used to distinguish between central and peripheral analgesics. The hot plate involves higher brain functions and indicates a supra-spinally structured reaction to thermal pain stimuli, whereas the tail immersion test involves spinal motor reflexes to thermal nociceptive stimuli. The effect of central analgesics like opioids is mediated via regulation of spinal (μ2, κ1, δ2) and supraspinal (μ1, κ3, δ1, σ2) receptors.[32]

To test peripheral nociception acetic acid-induced writhing paradigm was used. Acetic acid causes the hind limbs to extend, the back to arch, and the abdominal muscles to contract in response to peripheral nociception.[33,34] TNF-, interleukins, and other inflammatory mediators such as histamine, bradykinin, serotonin, substance P and prostaglandins are released when acetic acid is given intraperitoneally.[35,36]The nociceptors in the dorsal horn of the central nervous system are activated by cytokines and inflammatory mediators, which then activate inflammatory

DIRECTOR Yashoda Technical Campus Satara

pathways, resulting in pain feeling.37,38 These mediators stimulate chemosensitve nociception, developing abdominal constrictions. Such pain sensations are inhibited by non-steroidal anti-inflammatory drugs (NSAIDs), which exhibit antinociceptive effect by inhibiton of prostaglandin synthesis.[39,40]Ethanol extract*of Aesculus indica* seeds reduced the acetic acid-induced writhing, similar to caused that of aspirin revealing the antinociceptic effect of *Aesculus indica*, possibly through the inhibition of peripheral pain mediated pathways.

The presence of saponins, flavonoids and tanins in *Aesculus indica* may account for the anti-nociceptive effect found, as these phytochemicals are renowned for their analgesic effect, while the involvement of additional constituents present in the plant cannot be overlooked.

CONCLUSION

The current study found that at the dose levels tested as per the acute toxicity studies, the ethanol extract of *Aesculus indica* seeds has considerable dose dependent antinociceptive effects in laboratory animals. The findings show that antinociceptive activity of *Aesculus indica* is mediated by two analgesic pathways: peripheral and central.

The tail immersion and hot plate tests are linked with central activity and involve neuronal signaling pathways to respond thermal stimuli. Tail immersion test involves spinal motor reflexes to thermal nociceptive stimuli, whereas the hot plate involves higher brain functions and represents supra-spinally organized response to thermal pain stimuli. The peripheral nociception induced by acetic acid was inhibited by extract. Possible mechanism peripheral analgesic effect may likely due to cytokine inhibition and other inflammatory mediators.

The presence of saponins, flavonoids and tannins in *Aesculus indica* seeds, along with the existence of other phytochemicals, may be responsible for antinociceptive effects. The findings appear to back up the plant's historic use in the treatment of several painful illnesses and also point to the presence of biologically active compounds. However more research is needed to isolate and characterize the bioactive components responsible for the anti-nociceptive effect.

Abstract : Because of their ease of administration and patient compliance, mouth dissolving tablets have become more common among strong dosage types. They outperform traditional tablets in terms of efficiency. It aids in the enhancement of oral bioavailability. Waterless administration and quick onset of operation are two major advantages of mouth dissolving tablets. For any solid dosage type, disintegration is a critical phase. Superdisintegrants are a class of younger agents that have been produced in recent years. Superdisintegrants come in a variety of forms, including normal, synthetic, and co-processed. The aim of this article is to discuss the different types of superdisintegrants and their mechanisms in mouth dissolving tablets.

Index Terms -Disintegration, Superdisintegrants, Mouth dissolving, Classification, Mechanism.

1.Introduction:

In an aqueous atmosphere, superdisintegrants are agents applied to tablet and certain encapsulated formulations to facilitate the breakdown of tablet and capsule "slugs" into smaller fragments, thus expanding the available surface area and facilitating a more rapid release of the medication material. They help the tablet matrix to absorb moisture and disperse.[1-3]

Mouth dissolving tablets are new medication delivery devices with fast disintegration capabilities that have recently gained prominence by addressing the drawbacks of traditional tablets. It is a solid unit dosage type containing active agent that disintegrates rapidly as it comes into contact with saliva without the use of water or chewing.[4]Disintegration is a crucial stage in the operation of any solid unit dosage type, such as tablets or capsules. Disintegrating agents are used in the solid dose formulations in this case. Fast disintegration is essential for quicker drug release and action in mouth dissolving tablets, so superdisintegrants are added to help with faster disintegration. They're used at a lower concentration of 1-10% by weight of the overall weight of the dosage units.[5] Different forms of superdisintegrants are available, and they are used in mouth dissolving tablet formulations depending on their source and method of action. Tablet disintegration is influenced by a number of superdisintegrant causes, including.[6]

Percentage of disintegrants present in the formulation.

a) Proportion of superdisintegrants used.
b) Compatibility with other excipients.
c) Method of addition of superdisintegrant.
d) Presence of surfactants.
e) Nature of drug substance added.
f) Hardness of the tablets.
g) Method of mixing of addition.[7,8]

Because disintegration is so important in tablet dissolution before the active drug substance is finally released from the tablet structure into the body, disintegrant properties (e.g., disintegration time [DT] and the ratio of crushing strength-friability to disintegration time [CSFR/DT]) are influenced to a large extent by the type, concentration, and efficiency of disintegrants.[9]

Advantages of superdisintegrant:

- Should be seen at low concentrations.
- Less focus is needed.
- Intragranularly, it's more powerful.
- It is biodegradable.
- Wetting has a remarkable ability to cause accelerated disintegration.
- There are no lumps formed during disintegration.
- It's safe to use with common medicinal agents and excipients.
- Has a lower impact on compressibility and flow capacity so it doesn't cling to the punches and dyes.
- Some are anionic, and cationic drugs can induce some in vitro binding.[10,11,12]

Disadvantages of Superdisintegrants:

- More susceptible and hygroscopic in nature;
- Moisture sensitivity causes instability;
- Expensive.
- It's time-consuming and delicate.[13]

Ideal properties of superdisintegrants:

- It can disintegrate quickly, have a low water solubility, and have excellent moulding and flow properties.
- The particle size, hydration power, and compressibility index should all be fine.
- It should be compatible with the other excipients and have tableting properties that are desirable.
- It does not form complexes with the medications, be nontoxic, and have a pleasant mouth feel.
- Effective at low concentrations and can disintegrate more efficiently.
- The tablets should be compactable and less friable.[12,14,15,16]

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Selection of superdisintegrants:

Superdisintegrant must follow those conditions in addition to its swelling properties when it is used as an excipient in the tablet formulation. The tablet disintegrant's requirements should be well specified. The perfect disintegrant should possess the following characteristics:

- Poor solubility.
- No tendency to form complexes with the drugs.
- Poor gel formation.
- Good moulding.
- Good hydration capacity.
- Good flow property.
- Good mouthfeel.
- Effective in less quantity.
- Particle size should be small.
- Should be non-toxic.
- It should compatible with other excipients and drug.[15,16,17,18]

2. Superdisintegrants:

To enhance disintegration processes, new materials known as "superdisintegrants" have recently been created.[19,20] Another type of super-absorbing substance with custom-made swelling qualities is superdisintegrants. These materials are designed to swell quickly rather than absorb large volumes of water or aqueous fluids. Superdisintegrants are used to make disintegrable solid dose forms more structurally sound. They are physically scattered throughout the matrix of the dosage form, and when exposed to a moist environment, they expand.

One gram of superdisintegrant absorbs 10-40 g of water or aqueous media on average. Following absorption, swelling pressure and isotropic swelling of the superdisintegrants particles generate stress concentrated zones with a gradient of mechanical characteristics, causing the entire structure to disintegrate, as seen in fig.1.[15]

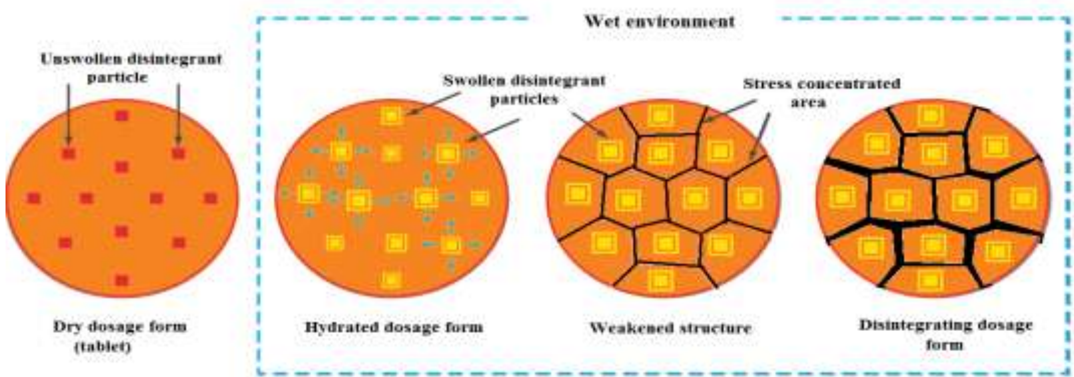

Fig.1: disintegration mechanism of superdisintegrant materials

2.1 Method of Incorporation:

The incorporation of superdisintegrants in the dosage forms are mainly of three types.

Intragranular or during granulation-

The superdisintegrants are mixed with other powders and then granulated in this procedure. Superdisintegrants are thereby absorbed into the granules.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Advantage-

Easy to add and suitable for direct compression method.[21,22]

Extragranular or before compression-

In this process, the superdisintegrants are mixed with prepared granules before compression.

Advantage-

Suitable for wet granulation process.[21,22]

Incorporation of superdisintegrants at intra- and extra-granulation step:

A portion of the suyperdisintegrants is added to intragranular and a portion to extragranular in this process. In comparison to Type I and Type II, this approach typically yields superior results and more thorough disintegration.[23]

Advantage-

This method is more effective and provides immediate tablet disintegration.[21,22]

2.2 Mechanism of superdisintegrants:[19,24,25,26,27]

The mechanism for breaking the tablets into small pieces and producing a homogeneous suspension is as follows:

1) Swelling
2) Porosity and capillary action(Wicking)
3) Heat of wetting
4) Chemical reaction(Acid-Base reaction)
5) Particle repulsive forces
6) Deformation recovery
7) Enzymatic reaction
8) Combination action(Swelling and wicking)

2.2.1 Swelling

Tablet disintegration is most commonly caused by swelling in both natural and manufactured superdisintegrantas. When the tablet comes into contact with a suitable medium, the first stage in this mechanism is water penetration, followed by swelling of the disintegrant particle, which leads to the generation of swelling force, resulting in tablet disintegration as illustrated in fig.2.

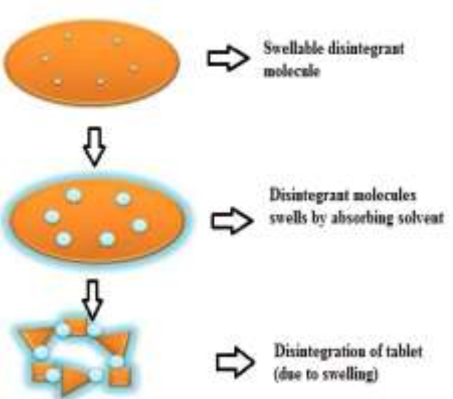

Fig.2: disintegration of tablets by swelling mechanism

2.2.2 Porosity and capillary action(Wicking)

Porosity and capillary action are thought to be responsible for the disintegration action of effective disintegrants that do not swell. Tablet porosity creates routes for liquids to penetrate the tablet. When we immerse the tablet in an appropriate aqueous medium, the medium enters the tablet and replaces the air adsorbed on the particles, weakening the intermolecular link and causing the tablet to disintegrate into tiny particles. The hydrophilicity of the drug/excipient as well as tableting circumstances influence water absorption.Maintenance of a porous structure and low interfacial tension towards aqueous fluid is required for these types of disintegrants, which aids in disintegration by producing a hydrophilic network surrounding the drug particles, as seen in fig.3.

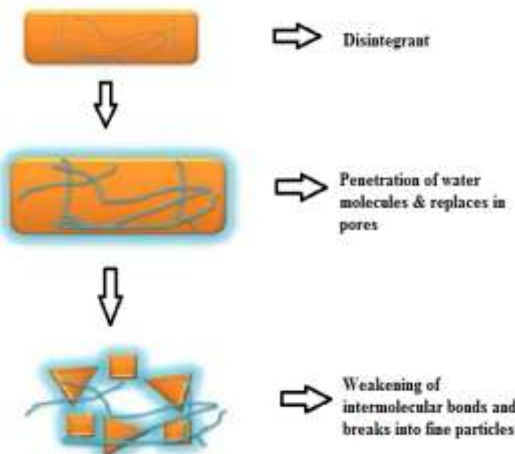

Fig.3: disintegration of tablet by wicking mechanism

2.2.3 Heat of wetting

This method can be used with any disintegrant that has an exothermic feature. When these disintegrants come into touch with appropriate media and get moist, capillary air expansion causes localised stress, resulting in tablet disintegration.[28]

2.2.4 Chemical reaction (Acid-Base reaction)

Due to the interaction of tartaric acid and citric acid with alkali metal carbonates or bicarbonates in the presence of water, the tablet is swiftly broken apart by internal CO2 release in water. The pressure within the tablet causes the tablet to dissolve.

2.2.5 Particle repulsive forces

This approach, which is based on Guyot-particle Hermann's repulsive theory, generates tablet breckdown by using non-swellabledisintegrant particles. Tablet disintegration is caused by electrostatic repulsion between particles, which necessitates the use of water. Researchers discovered that wicking is secondary to repulsion."Tablet in contact with appropriate medium, water enters into the tablet through hydrophilic pores, resulting to the production of a continuous starch-like network that assists in the transfer of water from one particle to another particle and causes hydrostatic pressure," according to Guyot-Hermann repulsion theory. As a result, hydrogen bonds and other forces that hold tablet particles together are broken, as seen in fig.4.[29]

DIRECTOR
Yashoda Technical Campus
Satara

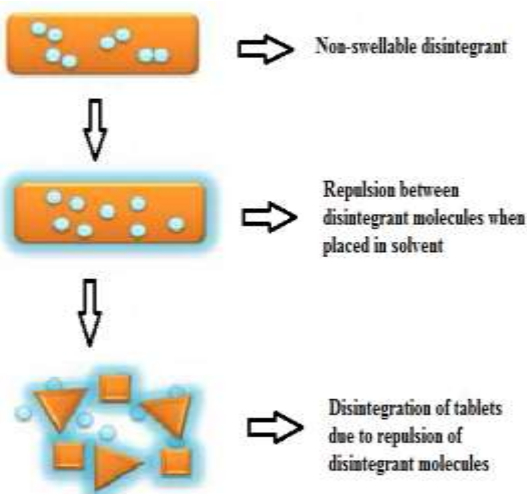

Fig.4: disintegration of tablets by repulsion mechanism

2.2.6 Deformation recovery

Starch grains are supposed to be "elastic" in nature, which means that if they are distorted under pressure, they will revert to their original shape once the pressure is released. However, because to the compression forces used in tableting, these grains are thought to remain permanently damaged and are described as "energy rich," with the energy released when exposed to water. In other words, the potential of “energy rich” starch grains to expand is greater than that of starch grains that have not been distorted under pressure. The activity of most disintegrants is thought to be the result of many mechanisms. Inter-relationships between these fundamental mechanisms are more likely to be the cause.

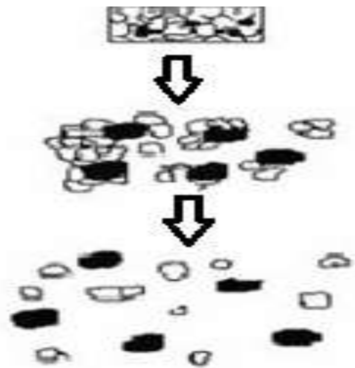

Fig.5: disintegration of tablets by deformation mechanism

2.2.7 Enzymatic reaction

Our bodies include enzymes that function as disintegrators by reducing the binder's capacity to bind. Swelling causes pressure to be applied in the outer direction, causing the tablet to rupture, or fast water absorption creates a massive rise in the volume of granules, promoting disintegration. One body enzymes which help in disintegration of tablets are given in the table 1.

Table 1: examples of enzymes

2.2.8 Combination action

The swelling and wicking mechanisms of the disintegrant induce the pill to break down.

Example: Crospovidone

2.3 Classification of superdisintegrant

a) Natural superdisintegrant
b) Synthetic superdisintegrant
c) Co-processed superdisintegrant

2.3.1 Natural superdisintegrant

Advantages

- Low cost compared to synthetic and renewable sources.
- Eco-friendly and bio-acceptable.
- Locally available.

2.3.2 Synthetic superdisintegrant

Advantages

- More effective intragranually.
- When compared to starch, it is effective at low concentrations.
- Have a negligible impact on compressibility.
- Have a minor impact on the capacity to flow.

2.3.3 Co-processed superdisintegrant

Excipient granulates are formed by co-processing excipients, which have better qualities than physical mixes of components or individual components. The procedure is used in order to achieve a synergistic change in the particular unwanted trait.

Table 2: name and mechanism of natural superdisintegrants[30,31,32]

S. No.	Name of superdisintegrant	Mechanism

7	Ludiflast

3. Conclusion

In the creation of mouth-dissolving tablets, superdisintegrants play a significant role. In an aqueous environment, superdisintegrants aid in the breakage of the tablet into smaller fragments. Superdisintegrants have been examined in terms of selection criteria, benefits, drawbacks, ideal qualities, technique, mechanism, and categorization. The approach of adding superdisintegrants via direct compression has gained appeal among researchers. Mouth dissolving tablet formulations are less complicated than other patented methods due to their simplicity of availability and compactness.

Abstract : Objective: To evaluate protective effect of Hesperidin (bioflavonoid, found in citrus fruits, such as lemon and orange) on Letrozole induced PCOS in female adult wistar rats. **Methods:** For inducing PCOS, letrozole (1 mg/kg) was administered p.o. for 21 consecutive days, followed by 15-days Hesperidin treatment at the doses 50 mg/kg, 100 mg/kg, and 200 mg/kg, p.o. using 0.5 percent w/v CMC as a vehicle. **Results:** Letrozole caused abnormalities in the ovarian weight, body weight, serum sex steroid profile such as FSH, LH, Testosterone levels and glucose levels. Most of the parameters were restored to normal levels, along with reduction of cysts in the ovaries due to Hesperidin.**Conclusion:** In female wistar rats, Hesperidin had a positive impact on PCOS caused by Letrozole. It had an effect similar to Clomiphene citrate, the most commonly used treatment for induction of ovulation in PCOS.
Keywords : Letrozole, PCOS, Hesperidin, Cysts, Clomiphene citrate.

1. Introduction:

Polycystic ovary (or ovarian) syndrome (PCOS) was first described by Leventhal and Stein in 1935[1]. Polycystic ovary syndrome (PCOS), a set of symptoms affecting women of childbearing age, is assumed to be epidemic in scope. Cysts form in the antral follicles of the ovaries as a result of an imbalance in the proportion of female sex hormones. PCOS is described as when multiple cysts develop in the ovarian follicles as a result of hormonal imbalance. In women, anovulation and the absence of a menstrual cycle inhibit fertilization and reproduction, making pregnancy difficult [2]. PCOS affects 6–10% of all women around the world[3].

Yashoda Technical Campus
Satara

Women with PCOS has several risk factors which are associated with development of uterine cancer including fatness, hyperinsulinemia, diabetes mellitus and abnormal uterine bleeding[4]. The frequency of depression and anxiety is higher in women with PCOS than in general population. Mood disorders are capable of impairing quality of life, which are well-known in young adult women, concerned with fertility, and in women of all ages with respect to obesity, and clinical manifestations of excessive androgen[5].

In rats, various experimental models for PCOS have been developed, including the administration of Estradiol Valerate, DHEA, and an excess of prepubertal androgen[6].Despite the fact that these models cause PCOS, none of them are entirely persuasive and accurately represent the symptoms of human PCOS. Letrozole, a non-steroidal aromatase inhibitor, causes PCOS model that is similar to human PCOS in several respects. It prevents the conversion of testosterone and androstenedione to estradiol and estrone respectively and generates PCOS related syndrome by inducing hormonal imbalance, circulating hyperandrogenism and intra ovarian androgen excess resulting to formation of polycystic ovary[7].Because of the induced elevation of androgen levels in ovaries, follicular atresia and irregular follicular growth are seen[8].Letrozole induction has been linked to hyperglycemia, which can lead to insulin resistance and hyperlipidemia, which also lead to metabolic syndrome[9].Today, a variety of medications are used to treat PCOS and stimulate ovulation. However, extreme side effects such as arthritis, joint or muscle pain, and psychological symptoms have been identified as a result of these therapies. As a result, natural-source medicines with minimal to no side effects are becoming increasingly popular[10].

Hesperidin (5, 7, 30-trihydroxy-40-methoxy-flavanone7-rhamnoglucoside) is a bioflavonoid found in citrus fruits like orange and lemon, as well as plant-derived beverages like tea and olive oil, which have traditionally been used in herbal medicine[11]. Hesperidin has wide range of pharmacological properties, such as antioxidant[12], anti-inflammatory, antihyperlipidemic[13], properties.

Hesperidin modulates the different hallmarks of cancer notably cell death, inflammation and oxidative stress mechanism.Hesperidin is also one of the most essential bioflavonoid present in the Citrus genus (Rutaceae)[14].In DMI rats, hesperidin has a considerable reduction in total blood lipid profiles and plasma insulin concentrations, as well as anti-hyperglycemic and hypolipidemic activity[15]. Due to the stated activities, we hypothesised that Hesperidin could be useful in the treatment of Letrozole-induced PCOS in this investigation.

2. Materials and Methods:

2.1. Experimental animals

Virgin, cyclic, adult female Wistar Albino rats (150–200 g) were employed for the study. These animals were procured from registered breeder and acquainted in the quarantine area for one week.After acquaintation, animals were transferred to the standard laboratory conditions and allowed to acclimatise for two weeks in animal house of YSPM’s Yashoda Technical Campus, Pharmacy, Wadhe, Satara. During the experimental study allanimals were caged in standardpolypropylene cages with maintained controlled environmentof 22 ±3℃ temperature, 50 ± 15% humidity and a 12 h light/dark cycle. They were fed with standard pellet diet and water provided*ad libitum*. The study was duly approved by Institutions AnimalEthics Committee(IAEC) for the use of animals and care of the animalswas carried out as per the guidelines of committee for the purposeof control and supervision of experiments on animals (CPCSEA).

2.2. Drugs and Reagents

Hesperidin was acquired from OZONE® INTERNATIONAL (INDIA). Letrozole was obtained from Sun Pharmaceutical Ind Limited.Clomiphene Citrate (Fertomid-50) tablets were procuredfrom Cipla, India. All other chemicals used were of analytical grade. Theserum follicle stimulating hormone (FSH), luteinizing hormone (LH) and Testosterone were measured via Enzyme Linked Immunosorbent Assay(ELISA) with the help of commercial kits (ELISA kit).Blood glucose level was measured using Accu-Check Active glucometer.

2.3. PCOS induction

All the experimental animals except control group were orally administered with Letrozole at a dose of 1 mg/kg dissolved in 0.5% Carboxy Methyl Cellulose (CMC) once daily for 21 days[7]. Control group received

YASHODA TECHNICAL CAMPUS SATARA
DIRECTOR

Satara

vehicle only (0.5% CMC). Vaginal Smears were collected daily and evaluated microscopically using 0.1% Crystal violet stain (prepared by diluting 0.1 g of crystal violet in 100 ml of double distilled water followed by filtration through whatman filter paper) and examined under X10 objective lens of laboratory microscope to confirm the induction of PCOS.

2.4. Study design

Thirty-six female Albino Wistar rats were divided into six groups: group 1 (control group), group 2 (PCOS induced group), group 3 (standard group), groups 4, 5 and 6 (treatment groups). Following Letrozole administration, standard group was administered with Clomiphene Citrate at a dose of 1 mg/kgp.o.in 0.5% CMC and treatment groups 4, 5 and 6 were administered Hesperidinat the dose of 50 mg/kg, 100 mg/kg and 200 mg/kg p.o.respectively in 0.5% CMC for 15 days i.e., from day 22^{nd} to 36^{th} day. At the end of the treatment animals were fasted overnight and anaesthetized with diethyl ether. Blood was collected by puncturing retro-orbital sinusthen by centrifugation method serum was separated and used for estimation of hormones.

2.5. Biochemical estimations

2.5.1.Hormonal assay

The serum luteinizing hormone (LH), follicle stimulating hormone (FSH), and Testosterone were measured via Enzyme Linked Immunosorbent Assay(ELISA) with the help of commercial kits (ELISA kit).

2.6. Ovarian histomorphology

The excised ovaries were fixed in 10% Formalin. According to histological procedure, they were subjected to tissue processing by washing with water which was followed by dehydration through an ascending ethanol series, then cleared through xylene. Then paraffin embedding method was used. The blocks were sectioned at 5 μm thickness using microtome and were mounted on slides coated with poly-lysine. These blocks were stained with hematoxylin-eosin(HE), dehydrated, cleared and mounted on DPX mountantunder glass cover slips. The light microscope (100X) was used for observation of slides which was connected to a camera to capture images[16].

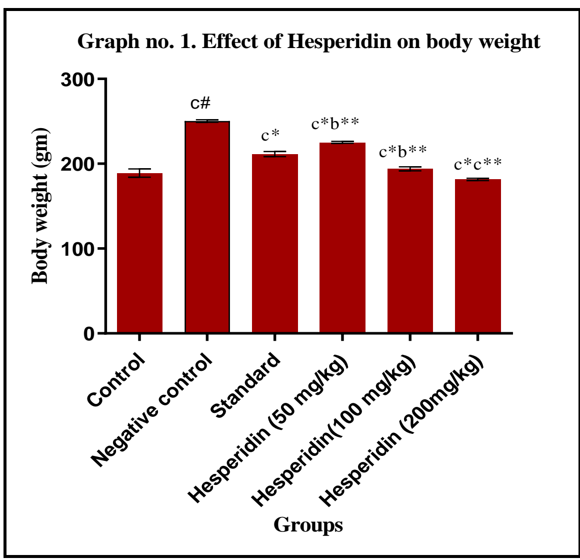
2.7. Statistical analysis

The statistical analysis was carried out with Graph pad prism 5.0 software. The data was statistically analyzed using one-way ANOVA method followed by Tukey's multiple comparison tests and p values ($p<0.05$, $p<0.01$, $p<0.001$)were considered to be statistically significant.

3. Results

3.1. Body weights

When body weight compared with control group, negative controlgroup showed significant elevation ($p<0.001$) in body weight. When standard and all treatment groups of hesperidin (50mg/ kg, 100mg/kg, 200mg/kg) compared to the negative group, the body weight decreased considerably ($p<0.001$).Low and Intermediate dose of hesperidin significantly ($p<0.01$) reduced the body weight as compared to standard group. High dose of hesperidin showed significantly ($p<0.001$) reduction in body weight as compared to standard group. (Graph no. 1)



#= Data compared with control group

****=Data compared with standard group**
a=p<0.05, b=p<0.01, c=p<0.001

3.2. Organ weights

3.2.1. Ovary weights

In terms of ovarian weights, there was significant increase in ovarian weight in negative group as compared with control group. After treatment with standard drug there was significant ($p<0.001$) decrease in ovarian weight as compared to negative group. When negative control groupcompared with intermediate and high dose of hesperidin, then it shows significantly ($p<0.001$)reduced ovarian weight. When low dose of hesperidin compared with standard and negative control group, then it indicated less significant decrease in ovary weight; whereas intermediate and high dose showed significantly ($p<0.01$ and $p<0.001$) decrease in weight of ovary respectively.(Graph no. 2)

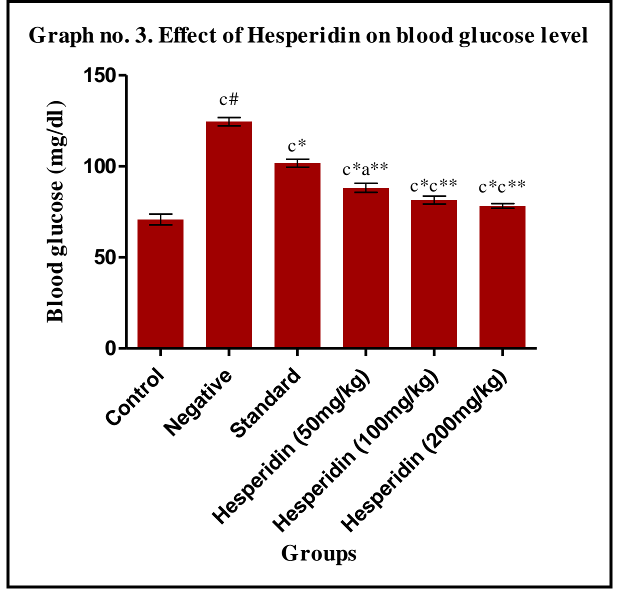
Table no. 1. Evaluation of Hesperidin on body weight and ovary weight of Letrozole induced PCOS in female rats

Group no.	Groups	Body weight(gm)	Ovary weight (mg)
1	Control	189.0±4.92	39.26±1.10
2	Negative	250.5±1.54[c#]	69.47±2.00[c#]
3	Standard	211.3±3.04[c*]	50.41±1.20[c*]
4	Hesperidin(50 mg/kg)	225.2±1.11[c*b**]	61.33±1.15[a*a**]
5	Hesperidin(100 mg/kg)	194±2.40[c*b**]	52.49±1.53[c*b**]
6	Hesperidin(200 mg/kg)	181.5±1.34[c*c**]	48.22±1.74[c*c**]

Control: CMC; Negative control: Letrozole; Standard: Clomiphene citrate; Low dose: Hesperidin 50mg/kg; Intermediate dose: Hesperidin 100mg/kg; High dose: Hesperidin 200 mg/kg

3.3. Fasting Blood Glucose(FBG) levels

Negative group exhibited significantly ($p<0.001$) elevated blood glucose level as compared to control group. When standard and all doses of hesperidin compared with negative group it showed significant ($p<0.001$) reduction of blood glucose level. Intermediate and high dose of hesperidin exhibited significantly($p<0.001$) decreasing level of blood sugar as compared with standard group. Low dose of hesperidin compared with standard then it indicated less significant decrease in ovary weight. (Graph no. 3)



#= Data compared with control group
***= Data compared with negative control group**
****=Data compared with standard group**
a=p<0.05, b=p<0.01, c=p<0.001

Table no. 2. Evaluation of Hesperidin on Fasting blood glucose(FBG) of Letrozole induced PCOS in female rats

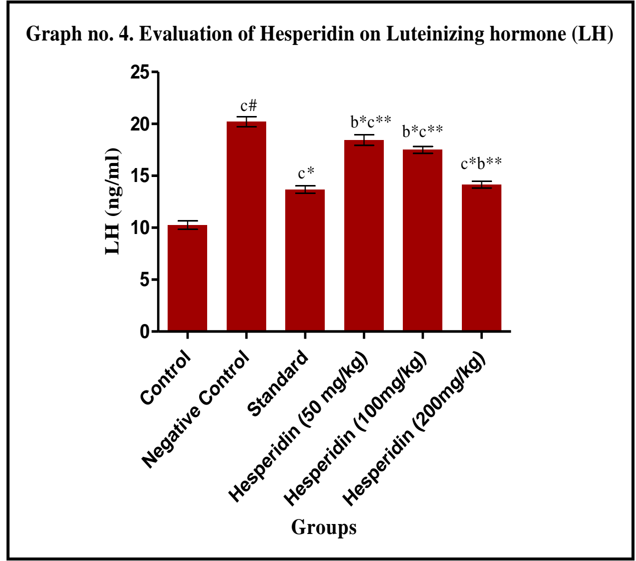
Group no.	Groups	Blood glucose (mg/dl)
1	Control	70.83±2.97
2	Negative	124.5±2.26$^{c\#}$
3	Standard	101.7±2.19^{c*}
4	Hesperidin(50 mg/kg)	88.17±2.46^{c*a**}
5	Hesperidin(100 mg/kg)	81.50±2.20^{c*c**}
6	Hesperidin(200 mg/kg)	76.33±1.27^{c*c**}

Control: CMC; Negative control: Letrozole; Standard: Clomiphene citrate; Low dose: Hesperidin 50mg/kg; Intermediate dose: Hesperidin 100mg/kg; High dose: Hesperidin 200 mg/kg.

3.4. Serum sex steroid profile

3.4.1.Evaluation of Hesperidin on Luteinizing hormone(LH) in Letrozole induced PCOS female rats

The serum levels of LH were remarkably increased in negative group ($p<0.001$) as compared with control group. All doses of Hesperidin showed significant reduction in LH level when compared with negative control group. Hesperidin (50mg/kg and 100mg/kg) showed significantly ($p<0.01$) decreased LH level as compared with standard. High dose of hesperidin shows decreased LH level significantly($p<0.01$) when compared with standard group. (Graph no.4)



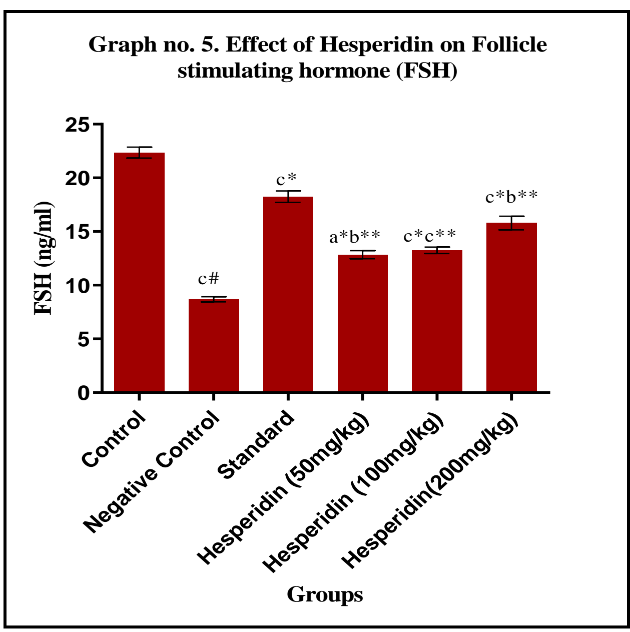
Graph no. 4. Evaluation of Hesperidin on Luteinizing hormone (LH)

#= Data compared with control group
***= Data compared with negative control group**
****=Data compared with standard group**
a=p<0.05, b=p<0.01, c=p<0.001

3.4.2. Evaluation of Hesperidin on Follicle stimulating hormone(FSH) in Letrozole induced PCOS female rats

The serum levels of FSH were significantly reduced in negative group of animals when compared with control group of animals.When both intermediate and high dose of hesperidin (100mg/kg and 200mg/kg) was compared with negative group it showed significant ($p<0.001$) elevation in FSH levels. Intermediate and high dose of hesperidin exhibited significant ($p<0.001$) increased FSH levels in comparison with standard group.

Low dose of hesperidin compared with standard and negative control then it indicated less significant decrease in FSH level. (Graph no.5)



#= Data compared with control group
***= Data compared with negative control group**
****=Data compared with standard group**
a=p<0.05, b=p<0.01, c=p<0.001

3.4.3. Evaluation of Hesperidin on Testosterone in Letrozole induced PCOS female rats

Testosterone significantly (p<0.001) raised in Letrozole induced group as compared with control group whereas standard and low, intermediate and high dose group of hesperidin significantly (p<0.001) reduced the levels of testosterone. Intermediate dose and high dose group of hesperidin significantly (p<0.05 and p<0.001 respectively) lowered the level of testosterone when compared with standard.(Graph no. 6)

3.5. Histopathological changes

3.5.1. Histopathological observation of ovaries in Control group

Section of ovaries from control group animals showed healthy follicles with oocyte at different stages of development. The primary, secondary and tertiary follicles indicated by arrows. (Figure 1)The photograph shows normal developing stages of follicles in ovary.

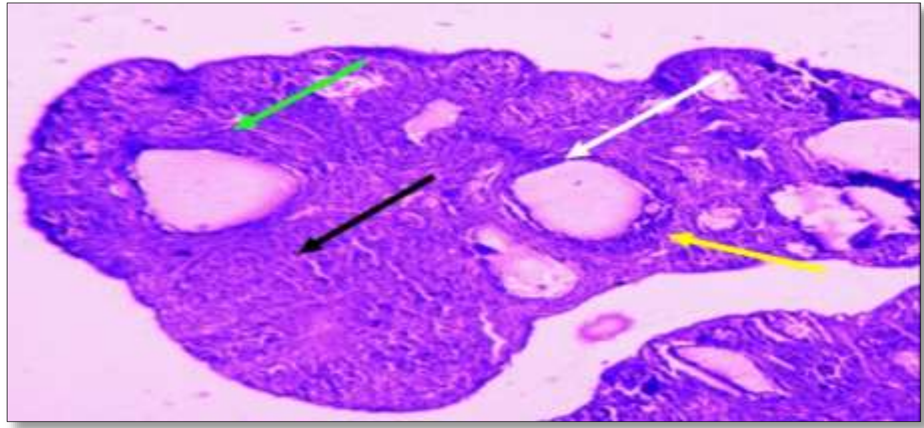

Fig no. 1 Histopathological observation of ovaries in Control group

Normal: Primary (white arrow), secondary (yellow arrow), tertiary (green arrow), corpus luteum (black arrow) (H&E stain100X)

3.5.2. Histopathological observation of ovaries in Negative Control group

Letrozole treated rats exhibited numerous cysts, with a very thin or no granulosa layer (Figure 2).Corpora lutea were completely absent indicating anovulation. Few follicles were observed at their early stages of development. In addition, they were accompanied withatretic follicles containing fluid filled antrum.

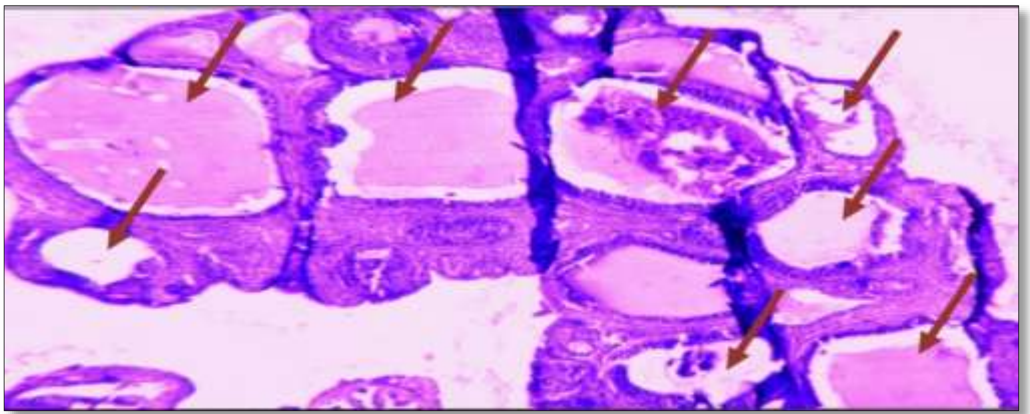

Fig no. 2. Histopathological observation of ovaries in Letrozole induced (Negative control) group

Negative: Cystic follicles (Brown arrow)

3.5.3.Histopathological observation of ovaries in Standard group

Clomiphene citrate treatment led to disappearance of cysts and appearance of healthy follicles and corporalutea. Decrease in cyst as compared to negative control group and shows developing follicles. (Figure 3)

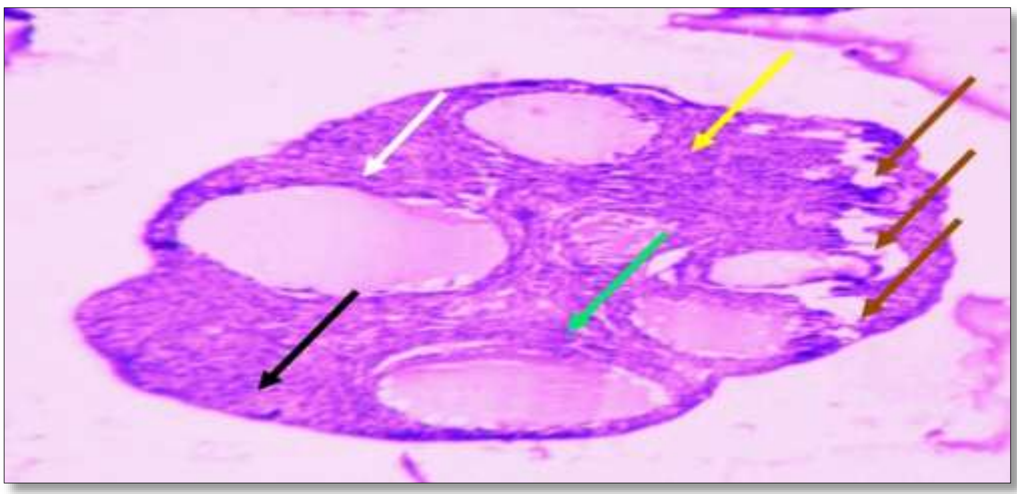

Fig no. 3. Histopathological observation of ovaries in Standard group

Standard: Primary (white arrow), secondary (yellow arrow), tertiary (green arrow), corpus luteum (black arrow), cystic follicles (brown arrow)

3.5.4. Histopathological observation of ovaries in Low dose (50 mg/kg) of hesperidin

Sections from low dose of hesperidin (50 mg/kg) group exhibited follicles larger in size and few corpora lutea. It also shows developing stages of follicles. (Figure 4)

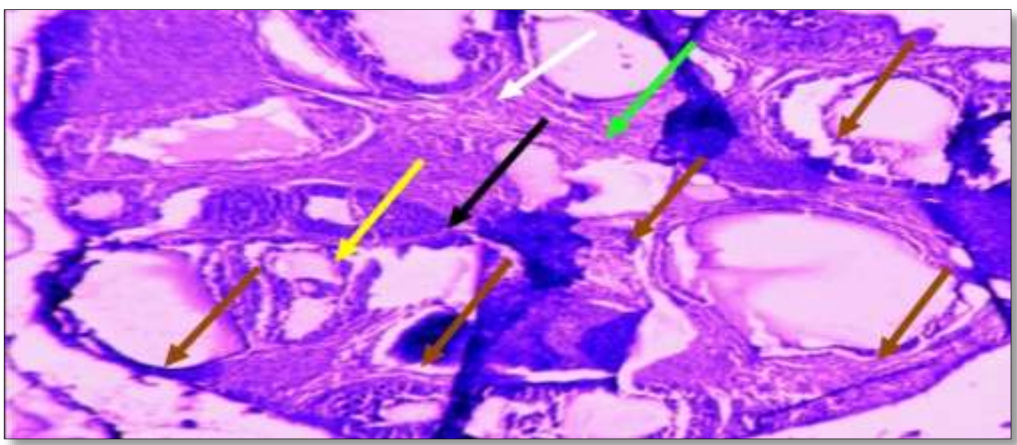

Fig no. 4. Histopathological observation of ovaries in Low dose (50 mg/kg) of hesperidin

Low Dose: Primary (white arrow), secondary (yellow arrow), tertiary (green arrow), corpus luteum (black arrow), cystic follicles (brown arrow)

3.5.5. Histopathological observation of ovaries in Intermediate dose (100 mg/kg) of hesperidin

Sections from intermediate dose of hesperidin (100 mg/kg) group exhibited few cysts and few corpora lutea. It also shows well differentiated developing stages of follicles. (Figure 5)

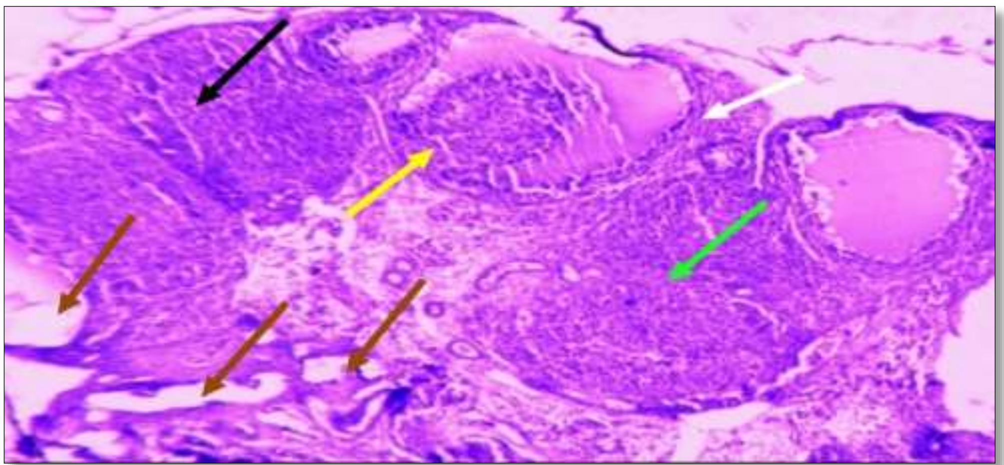

Fig no. 5. Histopathological observation of ovaries in Intermediate dose (100 mg/kg) of hesperidin

Intermediate Dose: Primary (white arrow), secondary (yellow arrow), tertiary (green arrow), corpus luteum (black arrow), cystic follicles (brown arrow)

3.5.6. Histopathological observation of ovaries in High dose (200 mg/kg) of hesperidin

Cysts were very less in number and normal sized healthy follicles at differentdevelopmental stages with oocytes were found in section fromhigh dose (200 mg/kg) group (Figure 6). Also with the high dosemany corpora lutea and antral follicles with clearly differentiated oocyte, granulosa cell layer were observed.

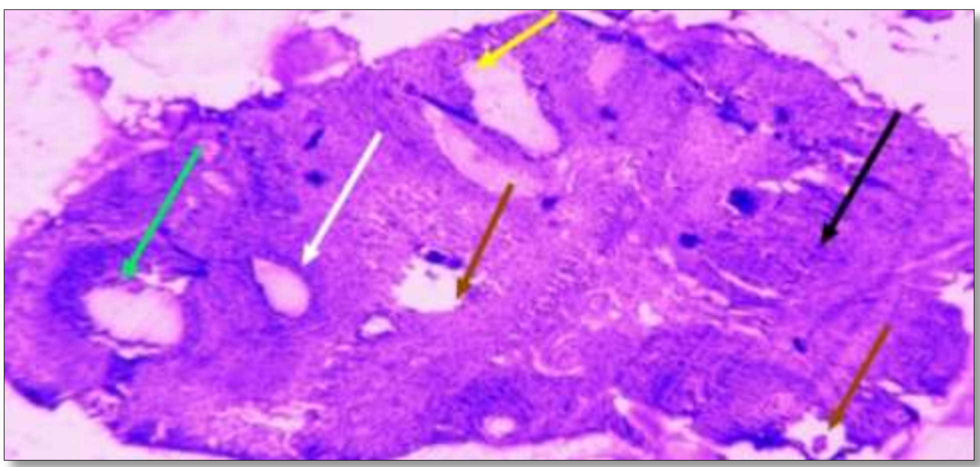

Fig no. 6. Histopathological observation of ovaries in High dose (200 mg/kg) of hesperidin

High Dose: Primary (white arrow), secondary (yellow arrow), tertiary (green arrow), corpus luteum (black arrow), cystic follicles (brown arrow)

4. Discussion

In this research, using the inhibitor of non-steroidal aromatase i.e. Letrozole, PCOS condition was developed in animals which presented biochemical and histological changes. The clinical and biochemical characteristics caused by PCOS in rats were investigated in this research.

The working of Letrozole induced PCOS model was confirmed by regular examination of vaginal smears and persistent vaginal cornification[17]. PCOS-induced rats enhanced body weight owing to abdominal fat deposition. But the body weight was considerably reduced by the therapy with hesperidin (50mg/kg, 100mg/kg, 200mg/kg). The weight of ovariesin negative group was greater than rats incontrol group, according to previous studies. The hesperidin therapy(50mg/kg,100mg/kg, and 200mg/kg)prohibited further rise in ovarian weight. The weight of ovaries in the negative group was greater than that of control rats according toobservations. Hesperidin therapy(50mg/kg,100mg/kg, and 200mg/kg) stopped further ovarian weight gain.

Letrozole induction of PCOS led in testosterone and LH levels being elevated while FSH level decreased. This imbalance in hormonal level led to an inconsistent cycle of estrous. The same circumstance have been noted in this research. Letrozole induced rats showed considerably higher concentrations of testosterone and LH when compared to control. Standard drug clomiphene citrate and hesperidin (100mg/kg, 200mg/kg) treated animals showed substantially reduced testosterone and LH levels. Hesperidin treatment showed FSH level elevation[18-20].

PCOS is also strongly linked with type-2 diabetes mellitus and insulin-resistant hyperglycemia[22]. In our analysis, there was a marked rise in blood glucose level in the negative group relative to the control group. Oral administration of hesperidin considerably inhibited increased blood sugar levels, indicating the impact of hesperidin on insulin resistance and diabetic conditions. Hesperidin showed beneficial effect against hyperglycemia as well as hyperlipidemia.

In ovaries, enhanced oxidant concentrations may change the steroidogenesis resulting in enhanced rates of androgen production and polycystic ovaries.[20-21] Many studies reported that oxidative stress is one of the various pathologicalfactors in women with PCOS[23].The histopathological report of Letrozole induced rats revealed the existence of polycysts in the ovary. If negative group compared to control group then negative group showed that more than two cysts were formed in the ovary. After therapy with hesperidin the cystic follicles reduced and also shows healthy follicles at different stages of development. This implies a marked recovery of ovarian tissue by hesperidin.

5. Conclusion

In normalizing the various parameters of PCOS condition in rats, the impact of hesperidin therapy with medium (100mg/kg) and high (200mg/kg) dose was observed to be similar with standard treatment.

In letrozole induced polycystic ovarian animals, hesperidin recovered the serum hormonal levels such as FSH,LH, and Testosterone, glycemic condition, along with body weight and ovarian weight. Thus, hesperidin might be helpful in managing PCOS condition due to restoration of irregular follicular phase and abnormal changes in the ovaries of rats.

ABSTRACT

Objective: To evaluate the hepatoprotective activity of leaves extract of *Pithecellobiumdulce* in experimental rats.
Methods: For the generation of Hepatotoxicity ,paracetamol (2g/kg) was administered orally for 7days, accompanied by a 7-day dose of Ethanolic extract of *Pithecellobiumdulce*leaves(100mg/kg, 200mg/kg, and400mg/kg, p.o.)using 1 % w/v CMC as a vehicle.
Results: From the present investigation, it was observed that ethanolic extract of *Pithecellobium dulce* have shown significant reduction in serum glutamate oxaloacetate transminase (SGOT),serum glutamate pyruvate transminase (SGPT),alkaline phosphatase (ALP) triglyceride, bilirubin level in paracetamol induced hepatotoxicity.
Conclusion: The findings in this study revealed the effectiveness of ethanolic extract of *Pithecellobiun dulce* against hepatotoxicity activity.

Keywords: *Pithecellobium dulce* ,Hepatotoxicity, Silymarin, Paracetamol, SGOT,SGPT,ALP

1. INTRODUCTION:

Hepatotoxicity is also termed as aquired high blood triglycerides; high bilirubin,highserum glutamate pyruvate transminase (SGPT); high serum glutamate oxaloacetate transminase (SGOT). It is an elevation of one or more of the plasma lipids, including triglycerides, cholesterol,always corresponding with cellular necrosis, increase in tissue lipid peroxidation and depletion in the tissue GSH levels[1]. In addition serum levels ofmany biochemical markers like bilirubin,triglyceride, alkaline phosphatase(ALP),Serum glutamate pyruvate transminase(SGPT),Serum glutamate oxaloacetate transminase(SGOT), triglycerides, cholesterol are exalted.The liver is the principal glandular organ in the body and has more functions than any other human organ.Liver is not only the second-largest organ of the body but also the largest gland. Liver is weighing about 1.4 kg in grown person and is underline to the diaphragm occupying most of the right hypochondriac and a part of the epigastric region of abdominopelvic cavity[2].Liver deals with many pathways which include energy provision ,nutrient supply,relevant to growth, fight against disease, and reproduction are corresponded with liver[3,4].The liver has an inventory task of maintaining the body's metabolic homeostasis. The liver is expected to perform physiological functions as well as protects against the hazards of chemicals and harmful drugs[5].Though tremendous scientific advancement in the field of hepatology , liver problems are on the rise. Jaundice and hepatitis are two major hepatic disorders and having higher mortality rate[6].In the makett , for the treatment of liver

Satara

1016

disorders there is only few hepatoprotective drugs are available .

Pithocellobium dulce Benth belongs to the family of Leguminasae.It is a small to medium sized ,evergrren and found in the India and Southern Asia.Locally *Pithocellobium dulce* is known by various names at different region such as Vilayti Babul in hindi and Vilayti chinch in Marathi and in English it is known as Manila tamarind[7]. The fruit of plant *Pithecellobium dulce* is well known as edible fruits and they have been consumed for various ailments in a traditional manner.The Fruits are greenish-brown to red-pinkish, indehiscent pods and linear, curved legumes (pods) that range in length from 10 to 13 cm. usually,pods are 10-15 cm; the colour becomes reddish brown.pods are irregular in shape and flattened,Each pods contain 5-10 shiny seeds, set in spirals of 1 to 3 whorls and strangled between the seeds (lomentaceous). The seeds are black in colour and shiny nature and 1cm long surrounded by an edible white pulp. The pod is peeled on both sides[8] (Orwa et al., 2009).*Pithecellobium dulce leaves* has been reported to contain Quercetin, Kaempferol, cyclitol, dulcitol afezilin[9]. *Pithecellobium dulce* also contains Quercetin 3-O-rhamnoside ,Seven saponins named Pithedulosides A-G,Pinitol,triterpenoids,glycoside etc. Literature survey indicates that *Pithecellobium dulce* possesses Antidiarrhoeal activity[10],Anticonvulsant activity[11], Adulticidal activity[12], Hypolipidemic activity[13], Anti-oxidant activity[14], Anti-diabetic[15], Antifungal Activity[16], Analgesic[17] ,Anti-inflammatory[17] ,Larvicidal and ovicidal activities[18] and antimicrobial activity[19]etc .Therefore, the present investigation was under taken to evaluate hepatoprotective effect of ethanolic extract of *Pithecellobium dulce* in paracetamol induced hepatotoxicty in rats which has not been earlier reported . It is our belief that this examination will take us another step forward in our quest to understand the mechanism of action of *Pithecellobium dulce* in prevention and medicaments of liver related diseases.

2. MATERIALS AND METHODS:

2.1.Drugs& chemical

Paracetamol was acquired from S.D.fine.chemialsMumbai.Silymarin(silybon140,Cipla Ltd.) was purchased in a tablet form at strength 140 mg. All other chemicals and reagents used were of analytical grade and aquired from approved chemical suppliers. The serum glutamate oxaloacetate (SGOT), Serum glutamate pyruvate transminase (SGPT) and Serum alkaline phosphate (ALP)and Total bilirubin were measured with the help of commercial kits.

2.2. Collection and extraction of plant material

The fresh leaves of *Pithecellobium dulce* was collected form local area of, Solapur District, Maharastra, India and were identified by a botanist. They were washed with tap water and dried leaves were powdered and passed through sieve for coarse powder. This shaded dried powdered was extracted successively with (1:6)Petrolium ether, Chloroform, Ethanol in a soxhlet apparatus allowed to stand for a period of 18 hr, and filtered by using Whatman filter paper (No. 1). The filtrate was concentrated at 45°C in a water bath for complete dryness. Crude extract obtained was stored at 4°C for further use.

2.3. Experimental animals

The complete experiment was carried out using 36 wistar albino rats of both sex weighing 150 - 200g.The study protocol was approved by Institutional Animal Ethics Committee (IAEC) ,YTC, YSPM, Satara. The animals were aquired from registered breeder and familiarized in the quarantine area for one week. Animals were housed in clean polypropylene cages in a controlled room temperature 22°C ± 2°C, relative humidity of 50 ± 15% and 12 hr dark/ 12 hr light cycle at our Institution's animal house and allowed to aculturate for two weeks. The animals were fed with water and standard pellet diet ad libitum. Animals were maintained as per Committee for the Purpose of Control and Supervision of Experiments on Animals Guidelines.

2.4. Preparation of standard drug

Silymarin tablets were crushed into powder, dissolved in distilled water at dose 200mg/kg b. w. and administered orally.

2.5. Induction of hepatotoxicity

All the experimental animals excepts control group ,were administered Oraly with Paracetamol at a dose of 2 gm/kg dissolved in 1% Carboxy Methyl Cellulose(CMC).

2.6. Experimental design

A total 36 wistar albino rats of either sex were randomly divided into 6 groups containing 6 animals in each group. Group I (Normal control) did not receive any treatment apart from vehicle 10ml/kg b. w. /day for 7 days. Group II (Negative control) were induced with 2.0g/kg b. w. dose of Paracetamol without treatment . Group III(Standard control) were induced with 2.0g/kg dose of Paracetamol and treated with silymarin at a dose of 200mg/kg b. w. /day for 7 days. Group IV, V and VIwere induced with 2.0g/kg dose of Paracetamol and treated with test drug at dose 100 (low), 200 (medium) and 400 (high) mg/kg b. w. /day for 7days respectively.

2.7.Blood Sample Collection

At end of the experimental period animals were kept fasted over night and anaesthetized with diethyl ether. Blood samples were collected serially by retro orbital puncture.The blood was allowed to clot for 30 min at room temperature then serum was separated by centrifugation and used for biochemical parameters like serum glutamate

YASHODA TECHNICAL CAMPUS SATARA

Satara

oxaloacetate (SGOT),Serum glutamate pyruvate transminase (SGPT) and Serum alkaline phosphate (ALP),Bilirubin, Triglycerides.

2.8.Evaluation parameters

2.8.1. Physical Parameter

Determination of wet liver weight:

Animals were sacrificed and livers were isolated and washed with saline and weights determined by using an electronic balance.The liver weight were expressed with respecte to its body weight i.e.gm/100gm.

Determination of Wet liver Volume:

After recording the weight all the livers were dropped individual in a measuring cylinder containing a fixed volume of distilled water or saline and the volume displaced was recorded.

2.8.2. Biochemical parameters

The principle, details of kits and methodology used in the estimation of various bio-chemical parameters by Autoanalyser in the present investigation are as follows

- Estimation of AST
- Estimation of ALT
- Estimation of ALP
- Estimation of bilirubin
- Estimation of triglycerides

2.8.3. Liver histopathology

The fixed specimens of liver were evolved by washing through running tap water, dehydration through ascending grades of alcohol, clearing through xylene and embedding completely with in paraffin into blocks. The serial sections of not exceeding 3 mm thickness were cut using microtome and were mounted on polylysine coated slides, removal of paraffin from tissues by using xylene, rehydrated and stained with hematoxylin and eosin, dehydrated, cleared and mounted on DPX under glass cover slips. The slides were then observed under light microscope which was connected to a camera to capture images.

2.9.Statistical analysis

The statistical analysis was carried out with Graphpad prism 5.0 software. The data was statistically analyzed using one-way ANOVA followed by Tukey's multiple comparison tests and $p < 0.05$ was considered to be statistically significant.

3. RESULTS AND DISCUSSION

3.1.Yield of the extract

The yield of the extract was found to be 24.35%. Further preliminary phytochemical screening revealed the presence of flavonoids, saponins, phenol, carbohydrates, tannins, alkaloids, sterols and glycoside.

3.2.Liver weight and Liver volume

Paracetamol treatment in rats showed the hepatic damage which was evident by increase in the liver weight and volume.when treated with standard (Silymarin) showed good reduction in weight and volume of liver.

Table1: Effect of ethanolic extract of Pithecellobiumdulce on Liver weight and volume of Paracetamol induced hepatotoxicity in experimental animals.

Sr. No	Experimental group	Liver weight gm/100gm	Liver volume ml/100gm
1	Normal control	2.82 ±0.11	5.62 ±0.24
2	Negative control	4.81 ± 0.12	9.62 ±0.17
3	Standard control	2.87 ±0.09	6.43 ±0.20
4	Test I	3.73 ±0.19	8.78 ±0.16
5	Test II	3.30 ±0.13	7.51 ±0.17
6	Test III	3.12 ±0.10	6.93 ±0.13

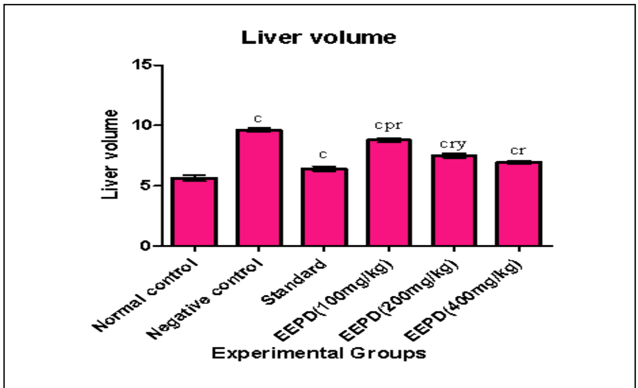

Figure 2: Effect of ethanolic extract of Pithecellobiumdulce leaves on Wet liver volume

Values represented mean ± SEM; n=6; Analysis was performed using one way ANOVA followed by Tukey's multiple comparison test; p value less than 0.05 was considered as statistically significant. a<0.05, b<0.01, c<0.001; Data compared with normal control; p<0.05, q<0.01, r<0.001 Data compared with negative control; x<0.05, y<0.01, z<0.001 Data compared with standard control (by one way ANOVA followed by Tukey's multiple comparison test).

3.2. Liver functional test

Paracetamol administration developed acute hepatotoxicty in rats by significantly increasing the level of triglycerides, SGOT,SGPT,ALP,Bilirubin level in rats treated with paracetamol group as compared to normal control group.

Effect of EEPD on AST,ALT,ALP levels in paracetamol induced hepatotoxicity in wistar rats:

Rats treated with paracetamol developed a significant liver damage observed as elevated serum levels of hepatospecific enzymes like aspartate amino transferase ,Alaninetransferase,when compared with normal control.Medicaments with silymarin showed protection against paracetamol induced hepatotoxicity.Test groups treated with ethanolic extract of leaves of pithecellobiumdulce showed significant effect which can be comparable with toxic control. In One way ANOVA Dunnet's test indicates a significant reduction on elevated serum enzymes levels with extract treated animals compared to toxic control animals.

Effect on total bilirubin:

The total bilirubin concentration was found to increase in animals with liver damage by paracetamol .In standard treated group (Silymarin) administration reduced total bilirubin and animal medicaments with EEPD have exhibited dose dependent significant reduction in total bilirubin compared to toxic control group.

Effect on Triglyceride:

Induction of hepatic damage by administration of paracetamol was increase the concentration of triglycerides.treatment with silymarin has shown significantly reduction in the triglycerides levels while EEPD have shown dose dependent decrease in triglyceride level compared to toxic control group**.**

5. CONCLUSION

In conclusion, the present study has demonstrated that ethanolic extract of *Pithecellobium dulce* has hepatoprotective effect in paracetamol induced hepatotoxicity. *Pithecellobium dulce* leaves ethanolic extract has showed dose dependent activities on liver weight and volume, various liver functional test Furthermore the better activities has has revealed by the EEPD at dose of 400mg/kg. Utilizing this model,*Pithecellobium dulce* ethanolic extract was showen to be effective in significantly lowering total triglycerides,AST,ALP and ALT levels; thus it can be used in the treatment and/or prevention of liver diseases.

Role of BDNF in different neurodegenerative diseases

Rohit J Bhadrike, Mahesh M Mali, Bharatee P Chaudhari, Vivekkumar K Redasani
YSPM's Yashoda Technical Campus, Faculty of Pharmacy, Satara, Maharashtra, India

Abstract
Neurodegeneration is the progressive loss of shape or characteristic of neurons, such as death of neurons. Many neurodegenerative diseases consisting of amyotrophic lateral sclerosis, Parkinson's, Alzheimer's, and Huntington's occur due to neurodegenerative processes. Such sicknesses are incurable, resulting in progressive degeneration and loss of life of neuron cells. Neurodegeneration can be discovered in lots of different ranges of neuronal circuitry starting from molecular to systemic Neurodegenerative ailment is an umbrella time period for a range of conditions which on the whole have an effect on the neurons in the human brain. Mind-derived neurotrophic element, additionally called BDNF, is a protein that, in people, is encoded by using the BDNF gene. BDNF is a member of the neurotrophin circle of relatives of increase elements that are associated with the canonical Nerve increase thing. Neurotrophic factors are determined inside the mind and the outer edge. BDNF acts on sure neurons of the valuable apprehensive system and the peripheral nervous machine, helping to support the survival of current neurons, and inspire the increase and differentiation of recent neurons and synapses. Inside the mind, it is energetic inside the hippocampus, cortex, and basal forebrain areas critical to learning, memory, and better wondering. It's also expressed within the retina, motor neurons, the kidneys, saliva, and the prostate. BDNF itself is critical for long-term memory. Even though the massive majority of neurons inside the mammalian mind are shaped prenatally, elements of the grownup mind maintain the potential to grow new neurons from neural stem cells in a procedure known as neurogenesis.

Keywords: neurodegeneration, brain-derived neurotrophic factor, nerve growth factor

Introduction

Brain derived neurotrophic factor (BDNF) is a neuro-defensive protein that regulates neuronal survival, growth and differentiation. The BDNF hypothesis of depression postulates that stress reduces BDNF concentrations in limbic device structures and this underpins the imperative pathogenic process in melancholy, even as antidepressants restore BDNF concentrations and through this alleviate depressive signs and symptoms. This idea has been derived from a wealthy literature and has drawn sizeable assist, so that it will be reviewed on this paper. Further this paper investigates the have an impact on of a not unusual unmarried nucleotide polymorphism (Val66Met) inside the gene encoding BDNF, which has a purposeful position in BDNF expression and can confer susceptibility to melancholy [1].

Brain-derived neurotrophic issue, also known as BDNF, is a secreted protein secreted in humans, is encoded by using the BDNF. Its miles a member of the neutrophin own family of increase factors, NGF. BDNF acts on sure neurons of the vital fearful system and the peripheral fearful gadget, supporting to support the survival of current neurons, and encourage the increase and differentiation of new neurons and synapse. Neurodegeneration is the innovative lack of shape or feature of neurons, including demise of neurons. Many neurodegenerative sicknesses which includes amyotrophic lateral sclerosis, Parkinson's, Alzheimer's, and Huntington's occur because of neurodegenerative methods. Such illnesses are incurable, ensuing in modern degeneration and demise of neuron cells. Neurodegeneration may be located in many distinctive tiers of neuronal circuitry ranging from molecular to systemic Neurodegenerative disease is an umbrella term for a number conditions which by and large affect the neurons inside the human mind. Neurodegenerative disease is an umbrella time period for various conditions which frequently have an effect on the neurons in the human mind. Mind-derived neurotrophic thing, additionally known as BDNF, is a protein that, in human beings, is encoded with the aid of the BDNF gene. BDNF is a member of the neurotrophin circle of relatives of increase factors, which can be related to the canonical Nerve boom factor. Neurotrophic factors are proteins, which play a crucial function in proliferation, differentiation, protection, plasticity, survival and function of neurons within the valuable and peripheral worried systems. These neuroprotective molecules exert sizable manage over the existence and demise pathways in cells. They participate in local responses to diverse types of neuronal stressors. In mammals, the neurotrophin brain-derived neurotrophic issue (BDNF) is a primary regulator of axonal growth and connectivity, neuronal differentiation, survival and synaptic plasticity. It is a key molecular goal in the development of medication in opposition to neurological problems. Several studies have proven the involvement of BDNF within the pathogenesis of neurodegenerative illnesses and psychiatric disorders, like depression and schizophrenia. The neurotrophic movements of BDNF had been installed with various neuronal populations. In the periphery system, BDNF has proven neurotrophic movements on small fiber sensory neurons concerned in sensory neuropathies

Brain Derived Neurotropic Factor (BDNF)

Brain-derived neurotrophic factor, additionally known as BDNF, is a secreted protein secreted in humans, is encoded by using the BDNF. It is a member of the neutrophin own

Satara

family of growth factors, NGF. BDNF acts on positive neurons of the relevant worried system and the peripheral worried device, helping to assist the survival of existing neurons, and inspire the boom and differentiation of new neurons and synapse [4].

Feature of BDNF

BDNF acts on positive neurons of the significant nervous system and the peripheral anxious gadget, supporting to aid the survival of present neurons, and encourage the growth and differentiation of latest neurons and synapses. Inside the mind, it's far active within the hippocampus, cortex, and basal forebrain—regions important to learning, memory, and higher questioning. It's also expressed inside the retina, motor neurons, the kidneys, saliva, and the prostate. BDNF itself is important for long-term reminiscence. Despite the fact that the significant majority of neurons within the mammalian mind are formed prenatally, components of the person mind keep the potential to develop new neurons from neural stem cells in a procedure called neurogenesis. Neurotrophins are proteins that assist to stimulate and control neurogenesis, the ability to make BDNF go through developmental defects inside the brain and sensory anxious system, and normally die quickly after delivery, suggesting that BDNF plays an essential position in regular neural development.

Different vital neurotrophins structurally associated with BDNF include NT-3, NT-four, and NGF [5, 6].

Synthesis and Release

BDNF is made within the endoplasmic reticulum and secreted from dense-core vesicles. It binds carboxypeptidase E (CPE), and the disruption of this binding has been proposed to reason the lack of sorting of BDNF into dense-core vesicles. Different trends consist of sensory neuron losses that affect coordination, balance, hearing, flavor, and respiration. Knockout mice additionally showcase cerebella abnormalities and a boom in the range of sympathetic neurons. sure varieties of physical exercising have been proven too markedly (threefold) boom BDNF synthesis inside the human brain, a phenomenon that's in part accountable for exercise-triggered neurogenesis and upgrades in cognitive function. Niacin seems to up modify BDNF and tropomyosin receptor kinase B (TrkB) expression as properly.

Parkinson's disease (PD)

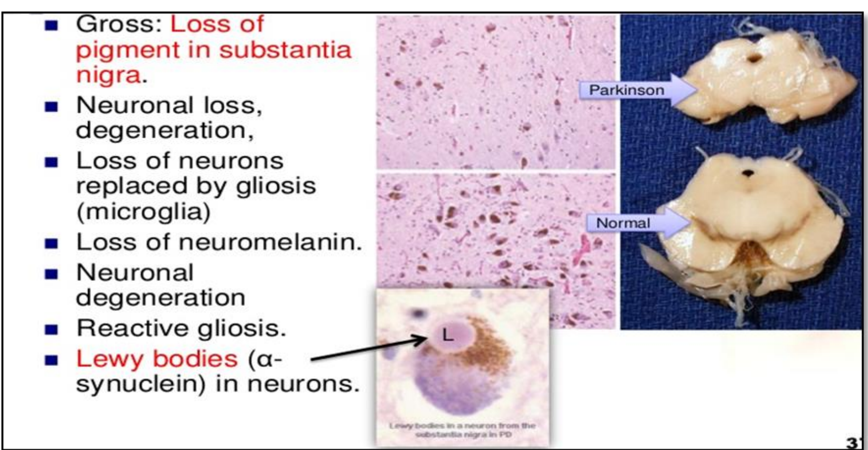

Fig 1: Pathology of Parkinson's diseas

Fig 2: Pathology of Parkinson's disease

Parkinson's disease is basically related to the slow lack of cells inside the substantia nigra of the brain. This region is accountable for the producing of dopamine. Dopamine is a chemical messenger that transmits signals between areas of the mind to coordinate hobby. As an instance, it connects the substantia nigra and the corpus striatum to modify muscle pastime.If there is deficiency of dopamine inside the striatum the nerve cells on this place fire out of manipulate. This leaves the character not able to direct or control moves. This results in the preliminary signs of Parkinson's sickness.

DIRECTOR
Yashoda Technical Campus
Satara

Because the disease progresses, other regions of the mind and fearful device degenerate as properly causing a more profound motion disease.
A protein known as alpha synuclein seems to be worried in neuronal degeneration. Alpha synuclein is produced thru dopaminergic neurons and is damaged down by using manner of other proteins, which includes parkin and neurosin.
Defects in any of the proteins that smash down alpha synuclein can also result in its accumulation, ensuing in the formation of deposits known as Lewy bodies in the substantia nigra.
However, other mechanisms affecting the accumulation of alpha synuclein had been recognized, and it isn't clear whether or not Lewy bodies are a purpose of or arise as a result of the disorder. Other findings in humans stricken by Parkinson ailment consist of mitochondrial dysfunction, main to accelerated production of free radicals that motive considerable harm to mind cells, and heightened sensitivity of the immune device and neurons to molecules known as cytokines, which stimulate inflammation.

Symptoms
Tremor at relaxation is the characteristic function of PD that earned it the sooner call of the shaking palsy. Rest tremor occurs rarely in every other situation. The tremor is gradual and rhythmic. It normally starts in one hand and handiest later spreads to contain the opposite aspect of initial involvement. Pressure is a term meaning a tightness or boom in muscle tone at relaxation or during the complete variety of movement of a limb. It can be felt as stiffness within the limbs, the neck, or even the trunk. Bradykinsia is slowness in bobbing up or initiating motion, and reduce in high-quality motor coordination (manifested via the inability to button a blouse, cut meat, and so forth.). Gait (walking) lower inside the natural arm swing is visible first, and most effective later do issues with slow, small steps and shuffling (festinating) arise stability issues and impairment of posture usually occur late within the course of normal pd, and are actually the maximum disabling of all the signs.

Treatment
Following drugs used in treatment of Parkinson's disease [10, 11]

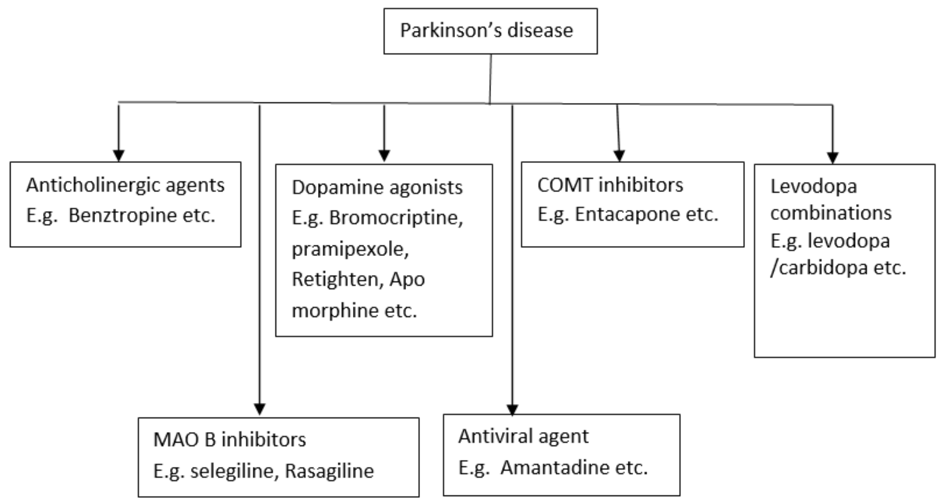

Fig 3: Parkinson's disease

Mechanism of action
Levodopa: Dopamine itself does not go the blood-brain barrier, but it's immediately precursor, levodopa, is with no trouble transported into the CNS and is transformed to dopamine within the brain. Big doses of levodopa are required, because a lot of the drug is decarboxylated to dopamine within the periphery, resulting in aspect outcomes that consist of nausea, vomiting, cardiac arrhyth mias, and hypotension. Carbidopa: The outcomes of levodopa at the CNS can be substantially better through coadministering carbidopa, a dopa decarboxylase inhibitor that doesn't move the blood-brain barrier. Carbidopa diminishes the metabolism of levodopa inside the gastrointestinal (GI) tract and peripheral tissues; for that reason, it increases the provision of levodopa to the CNS. [10].

Function of BDNF in Parkinson's sickness
BDNF performs a position in the advertising of the survival and function of striatal dopaminergic neurons and in regulating synaptic connectivity. other research have shown that BDNF mind and peripheral tiers are decreased in PD patients in comparison to HC verified that remedy with anti parkinsonian pills mayrise BDNF ranges. The position of physical interest in preventing PD onset or development has additionally been verified. BDNF maximum widely expressed and properly characterized member of the neurotropic family within the mammalian mind. It generated following cleavage of the precursor protein proBDNF and BDNF BDNFpro and the prodomuin are all biologically energetic functionally, BDNF has roles in various degree of neuronal in numerous of neuronal circuit development and additionally alter neural citrate shape and synaptic plasticity in person mind in molecular function BDNF in CNS and exceptionally lighting its therapeutic potential for situation which includes Parkinson's ailment stroke and spinal twine injury [12].

Alzheimer's disease (ad)
Alzheimer's disorder is a neurological ailment wherein the loss of life of brain cells reasons reminiscence loss and cognitive decline. A neurodegenerative kind of dementia, the disease starts offevolved moderate and receives gradually worse. [13, 14]

DIRECTOR
Yashoda Technical Campus
Satara

Pathology

The traditional neuropathological signs and symptoms of Alzheimer's disease are amyloid plaques and neurofibrillary tangles. Plaques consist largely of the protein fragment beta-amyloid. This fragment is made from obvious molecule called amyloid precursor protein. Tangles consist of tau, a protein typically concerned in keeping the inner structure of the nerve cell. at the same time as tau is commonly changed by means of phosphorylation, or the attachment of phosphate molecules, excessive phosphorylation appears to make contributions to tangle formation and stops the protein from sporting out its regular functions. Oxidative stress, or harm to mobile systems by using poisonous oxygen molecules known as free radicals, is also appeared as a pathology characteristic of Alzheimer's. People with Alzheimer's normally revel in brain inflammation. Many of the oldest sufferers with Alzheimer's show symptoms of cerebrovascular disease further to traditional Alzheimer's neuropathology

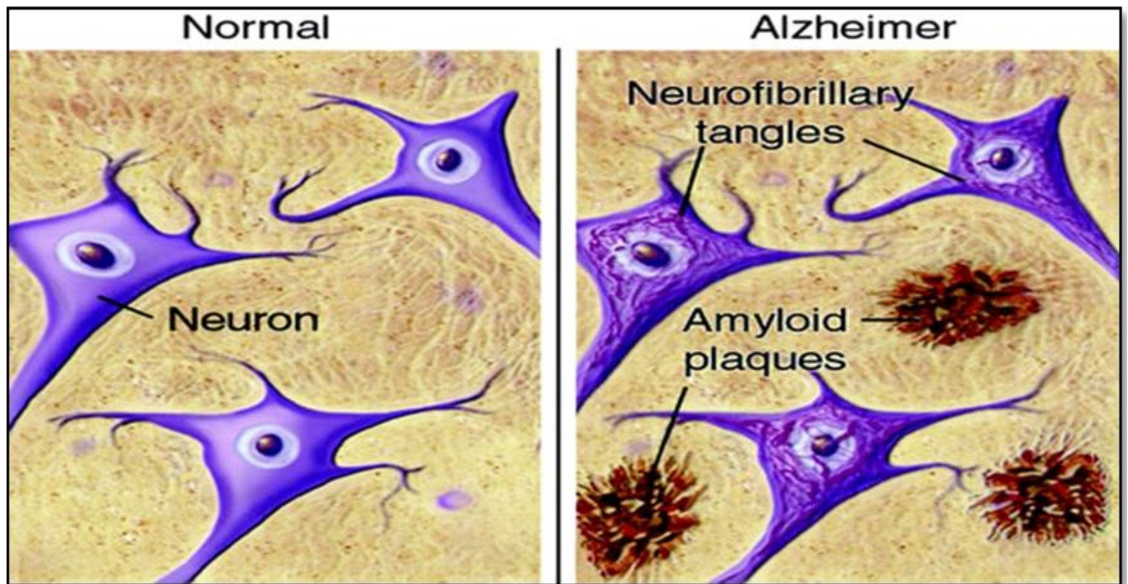

Fig 4: Pathogenesis of Alzheimer's disease

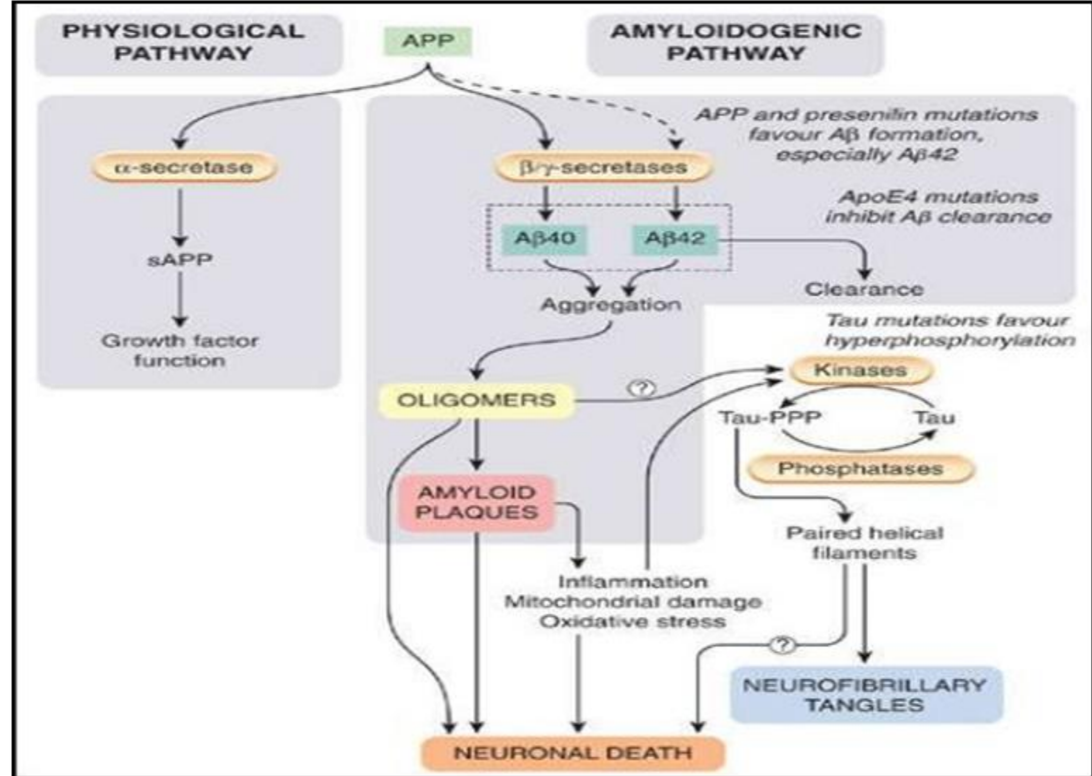

Fig 5: Pathogenesis of Alzheimer's disease

Symptoms

Normal early signs and symptoms of Alzheimer's may also include: reminiscence: often forgetting recent activities, names and faces. Repetition: becoming increasingly more repetitive, e.g. repeating questions after a totally quick interval. Misplacing matters: frequently misplacing objects or setting them in peculiar places. Confusion: Uncertainty approximately the time of day. Disorientation: mainly faraway from everyday surroundings. Language problems: locating the right phrases. Temper and conduct: some human beings turn out to be disinterested in what's going on around them, turn out to be irritable, or lose confidence memory and wondering abilties: humans will discover that their capability to consider, suppose and make selections worsens. Conversation: communique and language come to be tougher. Behavior: a person's conduct might also trade and some people can grow to be unhappy or depressed. Anger and agitation become more not unusual and people may additionally develop anxieties or phobias. Hallucinations: humans can also revel in hallucinations, where they may see matters or human beings that aren't there. Restlessness: problems with dozing and restlessness at night often arise. Unsteadiness: humans may additionally turn out to be increasingly unsteady on their feet and fall more frequently. Each day activities: human beings steadily require extra help with daily sports like: dressing, toileting and consuming.

Treatment

Following drugs used in treatment of Alzheimer's disease [13, 15].

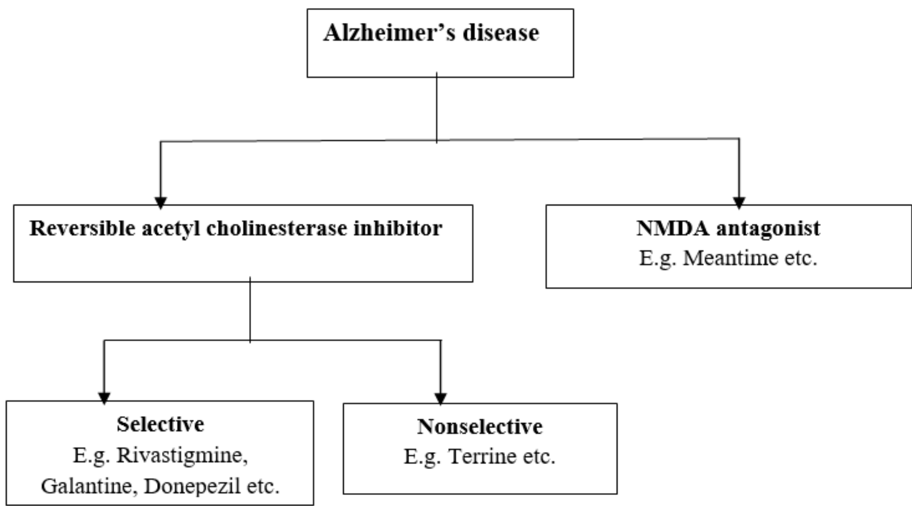

Fig 6: Alzheimer's disease

Mechanism of Action of Memantine

Memantine is the primary in a singular class of Alzheimer's disease medicinal drugs acting at the glutamatergic machine by way of blockading NMDA receptors. It turned into first synthesized by using Eli Lilly and agency in 1968 as a capability agent to treat diabetes; the NMDA interest become found inside the Nineteen Eighties. Memantine is marketed beneath the manufacturers Namenda / Auxura / Ebixa and memory amongst others. Memantine has been proven to have a modest effect in slight-to-extreme Alzheimer's ailment and in dementia with Lewy our bodies. Notwithstanding years of studies, there is little evidence of impact on mild Alzheimer's disease [17].

Role of BDNF in Alzheimer's disease:

It has been suggested that the early reminiscence dysfunction visible in Alzheimer's ailment may be related to the levels of BDNF in the hippocampus. Proof to guide this consists of appreciably decreased BDNF mRNA levels in Alzheimer's sickness hippocampus and parietal cortex and decreased protein levels of BDNF in entorhinal cortex, hippocampus, and temporal, frontal and parietal cortex. In contrast to mature NGF, mature BDNF protein can be visualized by way of western blotting, collectively with its seasoned-form. Both paperwork have now been proven to be decreased in Alzheimer's ailment, with a discount in mature BDNF of 23% reported in frontal cortex moreover a modern lower from everyday turned into visible in proBDNF in MCI (21%), and compared with Alzheimer (30%) parietal cortex [18].

Huntington's ailment

About Huntington sickness is a monogenetic hereditary neurodegenerative sickness caused by a defective gene on chromosome four. the HD gene is liable for generating a protein referred to as Huntington, a protein this is observed during the frame`s tissue however this is most concentrated in the brain. [19].

Pathology

Huntington sickness additionally known as Huntington chorea, an exceedingly rare, and forever deadly, hereditary neurological ailment this is characterised through abnormal and involuntary movements of the muscular tissues and innovative loss of cognitive capability. The disorder became first described by the american medical doctor George Huntington in 1872. Signs and symptoms of Huntington ailment typically seem between the whole of 35 and 50 and get worse over time. They start with occasional jerking or writhing actions, called choreiform movements, or what seem like minor troubles with coordination; these actions, which might be absent all through sleep, get worse over the following couple of years and development to random, uncontrollable, and frequently violent twitchings and jerks. Symptoms of intellectual deterioration may also seem which includes apathy, fatigue, irritability, restlessness, or

DIRECTOR
Yashoda Technical Campus
Satara

moodiness; these symptoms may progress to memory loss, dementia, bipolar disease, or a toddler of a person with Huntington ailment has a 50 percentage chance of inheriting the genetic mutation related to the sickness, and all folks that inherit the mutation will eventually increase the ailment. The genetic mutation that reasons Huntington disorder happens in a gene known as HD (formally named Huntington [Huntington disease]). This gene, that's located on human chromosome 4, encodes a protein known as Huntington, which is shipped in certain areas of the mind, in addition to different tissues of the body. Mutated kinds of the HD gene include abnormally repeated segments of deoxyribonucleic acid (DNA) referred to as CAG trinucleotide repeats. Those repeated segments bring about the synthesis of huntington proteins that incorporate lengthy stretches of molecules of the acid glutamine. While those odd huntington proteins are reduce into fragments for the duration of processing through cell enzymes, molecules of glutamine challenge out from the ends of the protein fragments, causing the fragments to stick to different proteins. The ensuing clumps of proteins have the ability to purpose neuron (nerve mobile) dysfunction. The formation of strange huntington proteins leads to the degeneration and eventual loss of life of neurons inside the basal ganglia, a couple of nerve clusters deep inside the brain that control motion.

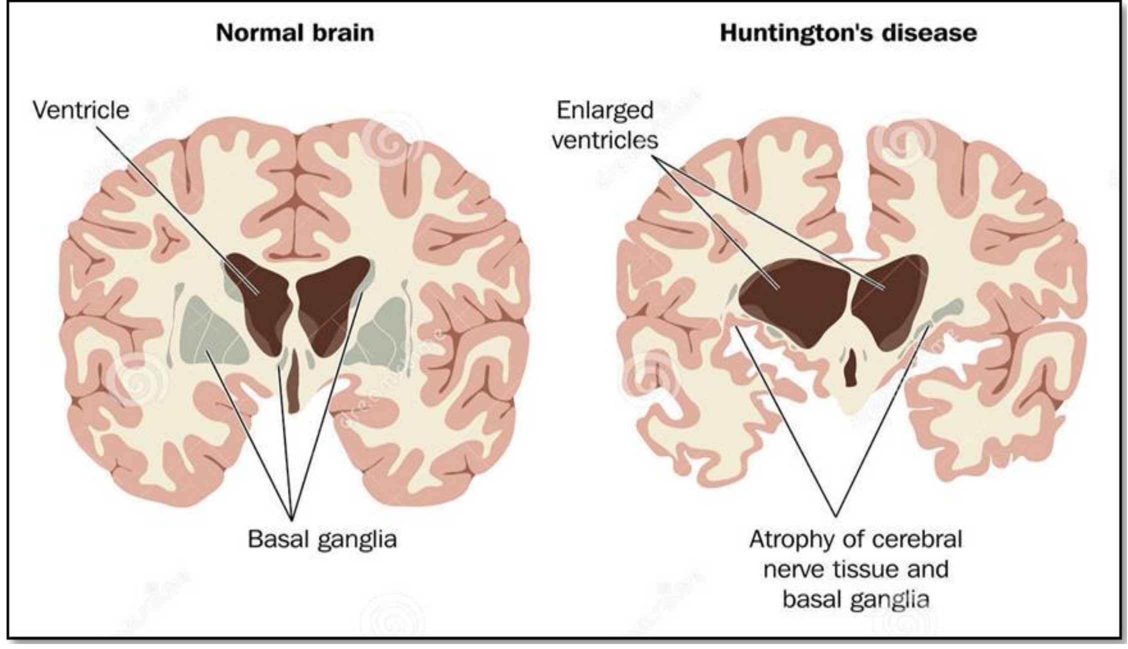

Fig 7: Pathogenesis of Huntington`s Disease

Symptoms

Signs and symptoms can appear at any age, but maximum commonly do so between the 35 and fifty five years. Below is a list of signs which can be relevant in a few instances. it is crucial to do not forget these may also vary depending at the character: moderate uncontrollable actions, Clumsiness, Stumbling, some moderate symptoms of lack of emotion, lack of recognition, moderate attention troubles, Lapses in brief-term memory, melancholy, mood modifications - this can encompass antisocial conduct and aggression [19].

Treatment

Following drugs used in treatment of Huntington Disease

The Mechanism of Action

Citalopram

The antidepressant, antiobsessive-compulsive, and antibulimic movements of citalopram are presumed to be linked to its inhibition of CNS neuronal uptake of serotonin. Citalopram blocks the reuptake of serotonin on the serotonin reuptake pump of the neuronal membrane, improving the moves of serotonin on 5HT1A autoreceptors. SSRIs bind with considerably less affinity to histamine, acetylcholine, and norepinephrine receptors than tricyclic antidepressant pills [20].

Role of BDNF in Huntington's disease

BDNF performs a function in the mechanism of antidepressant drug motion. The antidepressants known to affect BDNF ranges are selective serotonin reuptake inhibitors (SSRIs) and lithium moreover, memantine, riluzole, (a non-competitive inhibitor of ionotropic glutamate NMDA receptor) cystamine and cysteamine, have lately been proven to growth BDNF levels and their results on HD had been Serotonin might also have defensive consequences on striatal and cortical neurons by using activating cyclic AMP and CREB signals, which additionally cause BDNF expression; different target genes of cyclic AMP-CREB signalling that may play a role within the neuroprotective effect of SSRIs include Bcl-2 and NFKB.

A B S T R A C T

Objective: To evaluate antihyperlipidemic effect of red onion on poloxamer 407 induced hyperlipidemia in wistar albino rats.

Methods: Hyperlipidemia was induced by intraperitoneal injection of poloxamer-407 (P-407) at a dose of 1.0g/kg body weight in wistar albino rats. Drug treatments were done by oral gavage for 21 days. At the end of the study, animals were kept fasted over night and then blood samples were collected. The serum total cholesterol (TC), triglycerides (TG), and High density lipoprotein (HDL) were measured while low density lipoprotein (LDL) and very low density lipoprotein (VLDL) were calculated by Friedewald formula and atherogenic index was also calculated.

Results: From the present investigation, it was observed that ethanolic extract of red onion have shown significant reduction in serum cholesterol, triglyceride and lipoprotein levels and increase in HDL level in P-407 induced hyperlipidemia.

Conclusion: The findings in this study revealed the effectiveness of ethanolic extract of red onion against hyperlipidemic activity.

Key words: Hyperlipidemia, Poloxamer 407, red onion, Atorvastatin, Lipid Profile

INTRODUCTION:

Hyperlipidemia is also termed as acquired hyperlipoproteinemia; high blood triglycerides; high blood cholesterol; high cholesterol; high triglycerides; hyperlipidemia etc. [1]. It is an elevation of one or more of the plasma lipids, including triglycerides, cholesterol, cholesterol esters and phospholipids etc. [2]. It is also described by elevation of serum total cholesterol and low density and very low-density lipoprotein cholesterol and decreased high-density lipoprotein levels [3–6]. Number of clinical trials have verified that increase in plasma total cholesterol (TC) and triglycerides (TG) levels are implicated in the development of atherosclerosis [2]. It is also one of the important risk factor for developing cardiovascular diseases (CVDs) [4,7,8]. Principal CVDs associated with hyperlipidemia are hypertension, ischemic heart diseases, stroke, coronary heart diseases (CHDs) and atherosclerosis. They account for almost 80% of the burden of CVD in both developed and developing countries. A 20% decrease in blood cholesterol level can reduce about 31% of CHD incidence, and 33% of its mortality rate [9]. Because of all these risks associated with hyperlipidemia, treatment is often recommended for people with hyperlipidemia [10].

Effective treatment of hyperlipidemia includes dietary modifications and medications. There are number of antihyperlipidemic agents available in the market but they show certain side-effects and contraindications [10]. Statins are the first-line drugs for treatment of hyperlipidemia which act by inhibiting 3-hydroxy-3-methyl-glutaryl-

DIRECTOR Yashoda Technical Campus Satara

1031

coenzyme A (HMGCoA) reductase. However, statins have some adverse effects including rhabdomyolysis and derangements in hepatic function. Fibrates are used as second-line drugs for the treatment of dyslipidemia which acts by activating peroxisome proliferator-activated receptor alpha. However, fibrates shows adverse effects like allergic reactions, nausea, diarrhea etc. Nicotinic acid is also used to treat hyperlipidemia. However, it causes flushing, nausea, vomiting, diarrhea, anorexia like side-effects. Ezetimibe and bile acid sequestrants shows hypolipidemic effect by decreasing intestinal cholesterol absorption; but these drugs are associated with increased gastrointestinal adverse events and also affect the absorption of other biologically important substances [11]. An herbal treatment for hyperlipidemia has no side effects and is relatively less costly, locally available [4]. Hence, people are more interested towards traditional medicinal plants due to their natural origin, safe and non-toxic nature [12].

Red onion (*Allium cepa* L.) is the most widely cultivated species of the genus Allium. The portion of the plant commonly used is the bulb, utilized as a food ingredient to give flavour and aroma to a large variety of dishes [13]. Red onion has been reported to contain flavonoids, phenols, tannins, triterpenoids, cardiac glycosides, saponin and steroid phytochemicals [14]. It also contains Quercetin, cycloalliin, S-methyl-L-cysteine, S-propyl-L-cysteine sulfoxide, dimethyl trisulfide, S-methyl-L-cysteine sulfoxide etc. Literature survey indicates that red onion possesses anti-diabetic [15], Anti-Obesity [16], Hepatoprotective [17], Antidepressant [18], Analgesic [19], Anti-inflammatory [19] and antimicrobial activity etc [14]. Therefore, the present investigation was undertaken to evaluate hypolipidemic effect of ethanolic extract of red onion in poloxamer 407 induced hyperlipidemic rats which has not been previously reported. It is our belief that this investigation will take us another step forward in our quest to understand the mechanism of action of red onion in prevention and treatment of arteriosclerosis and heart related diseases.

MATERIALS AND METHODS:

Drugs & chemical

Poloxamer 407 was acquired from Emcure Pharmaceuticals Ltd Pune. Atorvastatin (Lipvas 20, cipla ltd.) was purchased in a tablet form at strength 20 mg. All other chemicals and reagents used were of analytical grade and procured from approved chemical suppliers. The total cholesterol (TC), triglycerides (TG) and high-density lipoprotein (HDL) were measured with the help of commercial kits.

Collection and extraction of plant material

Fresh red onions were purchased from a local market, satara and were identified by a botanist. They were washed with tap water and then cut into medium pieces. The chopped onions were then blended. The blended onion (200 g) then macerated in 2000 ml ethanol and allowed to stand for a period of 72 h. It was filtered using Whatman filter paper (No. 1). The filtrate was concentrated at 40°C in a water bath for complete dryness. Crude extract obtained was stored at 4°C for further use [20].

Experimental animals

The complete experiment was carried out using 36 wistar albino rats of either sex weighing 150 -200g. The study protocol was approved by Institutional Animal Ethics Committee (IAEC) of YSPM, Satara. The animals were procured from registered breeder and acquainted in the quarantine area for one week. Animals were housed in clean polypropylene cages in a controlled room temperature 22°C ± 2°C, relative humidity of 50 ± 15% and 12 hr dark/ 12 hr light cycle at our Institution's animal house and allowed to acclimatize for two weeks. The animals were fed with standard pellet diet and water *ad libitum*. Animals were maintained as per Committee for the Purpose of Control and Supervision of Experiments on Animals Guidelines.

Preparation of standard drug

Atorvastatin tablets were crushed into powder, dissolved in distilled water at dose 10mg/kg b. w. and administered orally *ad libitum* [9,21].

Induction of hyperlipidaemia

Poloxamer 407 dissolved in cold distilled water at dose 1.0g/kg b. w. and introduced intraperitoneally. All syringes were placed on ice prior to P-407 administration to maintain the polymer in a mobile viscous state during the injection [9,21].

Experimental design

A total 36 wistar albino rats of either sex were randomly divided into 6 groups containing 6 animals in each group. Group 1 (Normal control) did not receive any treatment apart from vehicle 10ml/kg b. w. /day for 21 days. Group 2 (Hyperlipidemic control) were induced with 1.0g/kg b. w. dose of P-407 without treatment [22]. Group 3 (Standard control) were induced with 1.0g/kg dose of P-407 and treated with atorvastatin at a dose of 10mg/kg b. w. /day for 21 days. Group 4, 5 and 6 were induced with 1.0g/kg dose of P-407 and treated with test drug at dose 200 (low), 300 (medium) and 400 (high) mg/kg b. w. /day for 21 days respectively [21].

Blood Sample Collection

At end of the experimental period, animals were kept fasted over night and anaesthetized with diethyl ether. Blood samples were collected serially by retro orbital puncture. The blood was allowed to clot for 30 min at room temperature then serum was separated by centrifugation and used for lipid analysis.

Evaluation parameters

Body weight

Body weight were recorded on the first day of treatment of all groups and final body weight were taken at the end of treatment of all groups to calculate changes between the initial and final body weight of animal throughout the study.

Biochemical parameters

The resulting serum was analyzed for serum TC and TG by Quinoneimine dye absorption method at 505 nm [23] and HDL by precipitation with phosphotungstic acid and Magnesium chloride [24].

Very low density lipoprotein cholesterol (VLDL-C) was calculated as [11,25,12]:

VLDL = TG/5.

Low density lipoprotein cholesterol (LDL-C) levels were calculated using Friedewald's formula [25]:

LDL = TC - HDL - TG/5

The atherogenic index (A.I.) was calculated using the following formula [26]:

(A.I.) = LOG (TG/HDL)

Liver histopathology

The fixed specimens of liver were processed by washing through running tap water, dehydration through ascending grades of alcohol, clearing through xylene and embedding completely with in paraffin into blocks. The serial sections of not exceeding 3 mm thickness were cut using microtome and were mounted on polylysine coated slides, deparaffinised using xylene, rehydrated and stained with hematoxylin and eosin, dehydrated, cleared and mounted on DPX under glass cover slips. The slides were then observed under light microscope which was connected to a camera to capture images.

Statistical analysis

The results were expressed as Mean ± SEM (n=6). The statistical analysis was carried out with Graph pad prism 5.0 software. The data was statistically analyzed using one-way ANOVA followed by Tukey's multiple comparison tests and $p< 0.05$ was considered to be statistically significant.

RESULTS & DISCUSSION

RESULTS

Yield of the extract

The yield of the extract was found to be 3.7%. Further preliminary phytochemical screening revealed the presence of flavonoids, saponins, phenol, diterpenes, triterpenes, alkaloids, phytosterol and proteins.

Body weight

Effect of administration of ethanolic extract of red onion on body weight of experimental animals has been shown in table 1. When compared with normal control group, negative control group and all test group animals showed significant ($p<0.001$) increase in body weight but standard control group animals do not show any significant changes in body weight. Furthermore, Standard control group and test II and III group animals showed significant ($p<0.001$) reduction in body weight, whereas test I group showed significant ($p<0.05$) reduction in body weight as compared to negative control group.

Table 1: Effect of ethanolic extract of red onion on body weight of P-407 induced hyperlipidemia in experimental animals.

Sr.	Experimental group	Initial body weight (gm)	Final body weight (gm)	Change in body weight (gm)
1	Normal control	166.6 ± 1.186	169.4 ± 1.622	4.642 ± 1.284
2	Negative control	170.30 ± 3.963	183.8 ± 1.126 ^{c}	13.45 ± 1.098
3	Standard control	168.9 ± 2.032	171.6 ± 1.287 ^{r}	5.33 ± 1.305
4	Test I (200mg/kg)	170.74 ± 2.889	180.3 ± 1.425^{cpz}	9.615 ± 1.491
5	Test II (300mg/kg)	168.75 ± 2.067	177.4 ± 0.689^{crz}	8.03 ± 1.56
6	Test III (400mg/kg)	169.15 ± 1.833	175.5 ± 0.872^{crx}	7.28 ± 1.046

Normal control: distilled water; Negative control: Poloxamer 407; Standard control: Atorvastatin; Test I: ROEE (200mg/kg); Test II: ROEE (300mg/kg); Test III: ROEE (400mg/kg).

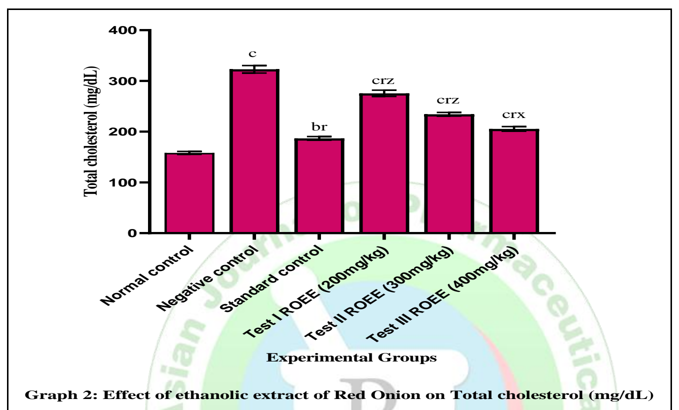
Effect of ethanolic extract of red onion on Total cholesterol

Table 2 shows that the ethanolic extract of red onion has significantly affected the level of total cholesterol in hyperlipidemic rats. The results found that the negative control group showed significant (p<0.001) increase in the level of TC as compared to normal control group. Whereas standard control, test I, test II and test III groups showed significant (p<0.001) reduction in TC level when compared with negative control group.

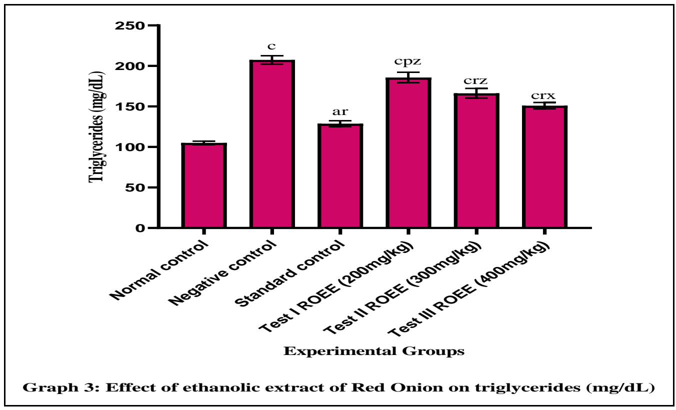


Graph 2: Effect of ethanolic extract of Red Onion on Total cholesterol (mg/dL)

Values represented mean ± SEM; n=6; Analysis was performed using one way ANOVA followed by Tukey's multiple comparison test; p value less than 0.05 was considered as statistically significant. a<0.05, b<0.01, c<0.001; Data compared with normal control; p<0.05, q<0.01, r<0.001 Data compared with negative control; x<0.05, y<0.01, z<0.001 Data compared with standard control (by one way ANOVA followed by Tukey's multiple comparison test).

Effect of ethanolic extract of red onion on Triglycerides

The mean values for triglyceride level are given in table 2. Negative control group showed significantly (p<0.001) increased level of triglycerides as compared to normal control group. Standard control, test II and test III group showed significant (p<0.001) reduction and test I group showed significant (p<0.05) reduction in the level of triglycerides as compared to negative control group.



Graph 3: Effect of ethanolic extract of Red Onion on triglycerides (mg/dL)

Values represented mean ± SEM; n=6; Analysis was performed using one way ANOVA followed by Tukey's multiple comparison test; p value less than 0.05 was considered as statistically significant. a<0.05, b<0.01, c<0.001; Data compared with normal control; p<0.05, q<0.01, r<0.001 Data compared with negative control; x<0.05, y<0.01, z<0.001 Data compared with standard control (by one way ANOVA followed by Tukey's multiple comparison test).

Effect of ethanolic extract of red onion on HDL

According to the data presented in table 2, the negative control group showed significant (p<0.001) decrease in the level of HDL as compared to normal control group. Whereas significant increase in the level of HDL was observed in standard control (p<0.001), test I (p<0.05), test

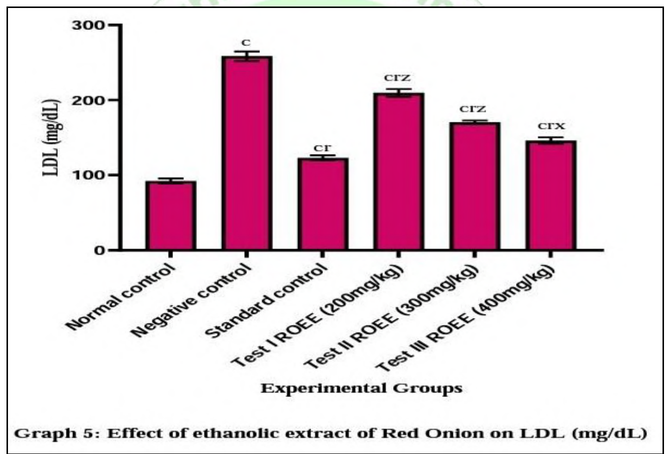
Effect of ethanolic extract of red onion on LDL

The mean values for LDL levels in normal and hyperlipidemic groups are given in table 2. When compared with normal control group negative control group showed significant ($p<0.001$) increase in the LDL level. While as compared to negative control group the standard control, test I, II and III group showed significant ($p<0.001$) decrease in LDL level.



Graph 5: Effect of ethanolic extract of Red Onion on LDL (mg/dL)

Values represented mean ± SEM; n=6; Analysis was performed using one way ANOVA followed by Tukey's multiple comparison test; p value less than 0.05 was considered as statistically significant. a<0.05, b<0.01, c<0.001; Data compared with normal control; p<0.05, q<0.01, r<0.001 Data compared with negative control; x<0.05, y<0.01, z<0.001 Data compared with standard control (by one way ANOVA followed by Tukey's multiple comparison test).

Effect of ethanolic extract of red onion on VLDL

Table 2 illustrated that the level of VLDL in different treatment groups was considerably affected. The negative control group showed significant ($p<0.001$) increase in the level of VLDL as compared to normal control group. Whereas test I group showed ($p<0.05$) and standard control, test II and III showed ($p<0.001$) significant reduction in VLDL level as compared to negative control group.

DISCUSSION

Lipids are organic compounds which are water insoluble but soluble in organic solvents. Lipids perform number of functions such as chemical messengers, storage and provision of energy, maintenance of temperature and membrane lipid layer formation. Hyperlipidemia is nothing but abnormally elevated level of lipids such as total cholesterol (TC), triglyceride (TG) and lipoproteins [26]. Diseases associated with hyperlipidemia are major risk factors for development of cardiovascular diseases (CVD) [27]. Hyperlipidemia is risk factor for onset and progression of atherosclerosis [28,29] viz high risk factor in development of coronary heart diseases [26]. Hence prevention or treatment of such disorders can be achieved by targeting the causative hyperlipidemia [27].

P – 407 induced hyperlipidemia is one of the animal model used for the evaluation of antihyperlipidemic activity of drug. It was harmless to membranes of cells, in earlier studies it was used effectively to induce hyperlipidemia. Poloxamer 407, a non-ionic synthetic copolymer surfactant commonly known used to induce hyperlipidemia in small laboratory animals within 24 h through i. p. injection. Due to its rapid onset, convenience, reproducibility, and lack of undesirable toxicity, P-407 was used in this study to induce hyperlipidemia in animals [11,30]. A single injection of P-407 caused elevations of serum cholesterol and triglyceride levels in rats. P-407 induced hyperlipidemia via alterations in activity of 3-hydroxy-3- methylglutaryl-CoA (HMG-CoA) reductase, lipoprotein lipase (LPL), lecithin cholesterol acyltransferase (LCAT), cholesteryl ester transfer protein (CETP), hepatic lipase (HL) and lipoprotein lipase (LPL). P-407 directly inhibits the capillary (heparin releasable) LPL and HL, and it indirectly increases the biologic activity of CETP and LCAT [9,31].

In our analysis, there was marked increase in the level of total cholesterol, triglycerides, LDL,VLDL, AI and decrease in the level of HDL in negative control group as compared to normal control group (Table 2) confirming that i.p. injection of P-407 has induced hyperlipidemia experimentally [9]. Red Onion ethanolic extract (200mg/kg, 300mg/kg and 400mg/kg) significantly decreased the increased level of total cholesterol, triglycerides, LDL,VLDL, AI and increased the level of HDL after treatment suggest the ameliorative potential of Red Onion.

In our analysis the body weight gain of different groups of rats showed that negative control group animals showed the significant increase in the body weight as compared to normal control group animals. After treatment with standard and test drug the body weight decreased significantly.

In this study, the significant elevation of TC concentration was achieved by the indirect stimulation of HMG CoA reductase by an intraperitoneal (i.p) injection of P-407 [26]. Hence the hypocholesterolemic effect of red onion ethanolic extract could be due to decreased activity of hepatic HMG CoA reductase, stimulation of Cholesterol-7-alpha-hydroxylase, which converts cholesterol into bile acids. It could also be due to the presence of saponins, a phytochemical which forms insoluble complexes with cholesterol or their bile salt precursor, thus making them unavailable for absorption. The results obtained in our analysis conform to earlier report that polyphenols possesses antilipidemic activity [9,26]. Besides, the standard drug (Atorvastatin) used in this study inhibits HMG CoA reductase, viz a rate limiting enzyme in the biosynthesis of cholesterol [26].

In our analysis, elevation in TG concentration after P-407 i.p. injection results primarily from an inhibition of TG degradation, P-407 directly inhibits capillary lipoprotein lipase (LPL) enzyme which is responsible for plasma TG hydrolysis and its clearance from the circulation [11,26]. The Red Onion ethanolic extract could have reduced TG levels by either activating lipoprotein lipase enzyme which hydrolyses the triglyceride into fatty acid hence decreasing triglyceride levels or by inhibiting lipolysis so that fatty acids do not get converted to triglyceride [11, 12, 26].

HDL act as cholesterol scavengers, they transport excess cholesterol and cholesterol esters from the blood and peripheral tissues back to the liver where it is broken down to bile acids. It plays a crucial role in reducing blood and peripheral cholesterol concentrations and inhibits formation of atherosclerotic plaque in the aorta therefore known as the protective cholesterol or Good cholesterol [26]. The present study indicates significant elevation in HDL concentration by the standard drug and ROEE. This could possibly be due to increasing activity of lecithin-cholesterol acyl transferase (LCAT), an enzyme which is responsible for incorporating free cholesterol into HDL there by promoting reverse cholesterol transport and competitively inhibiting the uptake of LDL-c by endothelial cells.

LDL (low density lipoprotein) transports cholesterol to the body cells. It transports near 60-70% of total cholesterol to the body cells. Therefore, an increase in TC level accordingly increases LDL-c [26]. LDL is referred as the most dangerous among the serum lipids, and the oxidation of LDL-c leads to its increased penetration of arterial walls. The increased LDL-c levels play a vital role in the development of atherosclerotic lesions that progress from fatty streaks to ulcerated plaques. Therefore, serum LDL levels are used as the basis for initiating and monitoring the treatment of patients with elevated blood cholesterol levels [9]. In the present study, ROEE shows marked reduction in LDL levels (Table 2). This result could be due to the presence of phenolics, a phytochemical which may work by increasing LDL receptors densities in the liver binding to apolipoprotein B thereby making liver cells more efficient to remove LDL from circulation [26].

Very low density lipoproteins (VLDLs) are secreted from the liver. They contain large amount of triglycerides. As it eventually gets converted into LDL and causes buildup of cholesterol on the walls of arteries it is categorized as a type of bad cholesterol [32]. The present study indicates significant decrease in VLDL concentration by the ROEE. This effect could probably be due to the inhibition of triglyceride and possibly fatty acid synthesis by phenolic constituents of red onion. Atherogenic risk predictor index log (TG/HDL-c) has been considered as the most accurate in determining the extent of atherosclerosis and the risk of myocardial infarction. The present study showed that the Red Onion ethanolic extract has significantly reduced

Yashoda Technical Campus Satara

1039

atherogenic index as compared to negative control group. The results suggest the anti-atherogenic potential of Red Onion ethanolic extract and hence, reducing the development of coronary atherosclerosis [26].

Histopathology study of liver was also carried out to check fatty changes, necrosis of hepatocytes, congestion and leucocytic infiltration. The histopathological report of negative control group animals showed the development of fatty changes, necrosis of hepatocytes, congestion and leucocytic infiltration while the histopathological report of normal control group animals did not show any fatty changes. Whereas the group of animals treated with ROEE (400mg/kg) restored hepatocytes near to normal control group.

CONCLUSION

In conclusion, the present study has demonstrated that ethanolic extract of Red Onion has antihyperlipidemic effect in Poloxamer 407 induced hyperlipidemia. Red Onion ethanolic extract has showed dose dependent activities on body weight, various serum lipids and atherogenic index. Furthermore the better activities has revealed by the ROEE at dose of 400mg/kg. Utilizing this model, Red Onion ethanolic extract was shown to be effective in significantly lowering total cholesterol, triglycerides, LDL, VLDL and increasing HDL cholesterol levels; also decreasing atherogenic index; thus it can be used in the treatment and/or prevention of cardiovascular diseases.

ABSTRACT

Objective: Evaluation of Antidiabetic Potential of *Eucalyptus globulus* Plant Extract in Dexamethasone-Induced Diabetic Rats.

Method: Methanolic leaves extract of *Eucalyptus globulus* Plant was prepared by Soxhlet extraction method. Female Albino Wistar rats were made diabetic at the dose of Dexamethasone (5mg/kg/day i.p.) for 12 days. Methanolic leaves extract of *Eucalyptus globulus* Plant (200mg/kg, 400mg/kg & 600mg/kg/day p.o.) was screened for antidiabetic activity. Standard drug Metformin (40mg/kg/day p.o.) was administered to the second group of animals for 12 days. Blood glucose levels and body weights of rats were recorded on 0, 6, 12th days. As well as Hypoglycemic & OGTT evaluation was done. At the end of respective treatment different biochemical estimations & histopathological examination of liver was also carried out.

Result: 12 Days oral administration of the *Eucalyptus globulus* Plant leaves extract caused significant ($P< 0.05$) reduction in blood glucose level & body weight was also gained as compared with toxic control group. Further, it showed the hypoglycemic activity & significant oral glucose tolerance as compared with control animals. The extract also improved other altered biochemical parameters associated with diabetes. Concurrent histopathological examination of liver of these animals showed regeneration by Methanolic leaves extract which was earlier necrosed by Dexamethasone.

Conclusion: Results obtained in this study substantiate the Antidiabetic potential of Methanolic leaves extract of *Eucalyptus globulus* Plant the source of Ellagitannins a bioactive polyphenol and could be considered for further evaluation in clinical studies and drug development.

Keywords: Antidiabetic potential, OGTT, *Eucalyptus globulus*, Polyphenols, Dexamethasone, Insulin.

1. INTRODUCTION

Diabetes mellitus is the chronic metabolic & pancreatic islet disorder mainly characterized by disruption in carbohydrates, protein, and fat metabolism caused by an inability to produce insulin or a defect in utilization. The hyperglycemia caused due to decreased insulin production is called Type-1 diabetes and hyperglycemia due insufficient insulin utilization is called Type-2 diabetes. The feature of diabetes mellitus is polyuria, polydipsia, weight gain and polyphagia. It is also characterized by chronic hyperglycemia and glucosuria, caused by an absolute or relative deficiency of insulin. This may result into the development of further complications which include hypertension, atherosclerosis, ketosis, gangrene and microcirculatory disorders. It is also associated with long-term complications including retinopathy, nephropathy, neuropathy and angiopathy[1]. The IDF (International Diabetes federation) has subsequently released estimates of the numbers of people with diabetes for 2003 and forecasts for 2025 of 194 million and 334 million, respectively. India leads the world

DIRECTOR Yashoda Technical Campus Satara

with largest number of diabetic subjects earning of term “diabetes capital of the world”[2]. Hyperglycemia can be handed initially with oral synthetic 2 Advances in Pharmacological Sciences agent and insulin therapy. Glucose lowering drugs usually succeed in lowering blood sugar levels, therapeutic agents like Insulin, Sulfonylureas, Meglitinides, Biguanides, Thiozolidinediones, DPP-4 inhibitors, α-Glucosidase Inhibitors, Incretin agonists, D2 Agonist may reduce the risk of type 2 diabetes but healthy lifestyle choices remain essential[3]. However, on chronic usage most of these agents produced several side effects including hypoglycemic coma, insulin resistance, hyper-sensitivity, jaundice, abdominal pain, anorexia and metallic taste. Because of the high mortality and morbidity arising from its attendant complications and problems associated with the use of conventional antidiabetic agents[4]. In the natural system of medicine, many Plants have been claimed to be useful for the treatment of diabetes mellitus. The dependence of large rural population on medicinal Plants for treatment of diabetes is because of its availability and affordability. The current worldwide trends towards utilization of Plant-derived natural remedies have, therefore, created a dire need for accurate and up-to-date information on the properties, uses, efficacy, safety, quality & less cost of medicinal Plant products than the semi-synthetics or synthetics. The Plant kingdom has become a target for the search by multinational drug and biologically active lead compounds. In this regard herbal, ayurvedic remedies can improve diabetic conditions without side effects[5]. Ellagitannins (ETs) and ellagic acid (EA) are polyphenols present in some fruits, nuts and seeds, such as pomegranates, black raspberries, raspberries, strawberries, walnuts, almonds & also present in ‘*Eucalyptus globulus* Plant’. Ellagitannins contain various numbers of hexahydroxydiphenoyl units, as well as galloyl units and/or sanguisorboyl units bounded to sugar moiety. In order to determine the quantity of every individual unit, the hydrolysis of the extracts with trifluoroacetic acid in methanol/water system is performed. They form a diverse group of bioactive polyphenols with anti-inflammatory, anticancer, antioxidant and antimicrobial (antibacterial, antifungal and antiviral) activity[6]. So, the present study was undertaken to Evaluate Antidiabetic Potential of *Eucalyptus globulus* Plant Extract the source of Ellagitannins in Dexamethasone - induced Diabetic Rats.

2. MATERIALS & METHODS

2.1 Collection of Plant Material:

Eucalyptus globulus Plant was collected from Local area of Kolhapur District, Maharashtra, India in January 2021 and authenticated as *Eucalyptus globulus (Family: Myrtaceae)* by Department of Botany, Yashwantrao Chavan College of Science, Satara, Maharashtra, India based on the taxonomical features of the whole Plant material including Leaves.

2.2 Preparation of Methanolic Extract:

Leaves of *Eucalyptus globulus* Plant were shade dried for one week after proper cleaning. *Eucalyptus globulus* Plant leaves were coarsely grounded & Methanolic leaves extract was prepared using Soxhlet apparatus by hot percolation method. The obtained extract was concentrated to dryness using rotatory evaporator under reduced pressure & low pressure (<40°C). Extract was kept in air-tight container and stored at 4°C for further studies.

2.3 Phytochemical Screening:

The extract was subjected to phytochemical analysis to test the presence of volatile oils, carbohydrates, alkaloids, glycosides, polyphenols, flavonoids, tannins, propanoids, sterols terpenoids, ketones & alcohols in the leaves extract.

2.4 Drugs and Chemicals:

Dexamethasone obtained from Merck/Dolphin Pharmacy Instruments Pvt. Ltd. Mumbai. Metformin obtained from Aventis Pharma, Ltd. Goa. ACCU-CHECK Active Glucometer procured from Roche Diabetes Care, India/Dolphin Pharmacy Instruments Pvt. Ltd. Mumbai.

2.5 Animals & Housing condition:

Female Albino Wistar Rats of (150-200gm) were selected for experimental study. The animals were maintained under standard laboratory conditions in an animal house approved by Committee for the Purpose of Control and Supervision of Experiments on Animals (CPCSEA). The animals were kept and maintained under laboratory conditions of temperature 22 ± 2°C, relative humidity 50 ± 15% and 12 hrs. light/dark cycle. They were allowed free access to food (standard pellets) and water ad libitum. Experimental protocols and procedures used in this study was approved by the Institutional Animal Ethics Committee (IAEC) of YSPM’s, YTC, Faculty of Pharmacy, Satara, Maharashtra, India.

2.6 Induction of Diabetes:

Dexamethasone is a synthetic glucocorticoid prevents postoperative nausea and vomiting but may increase blood glucose. These drugs will promote gluconeogenesis or increased blood sugar levels in blood. Chronic exposure to high doses of Dexamethasone causes insulin resistance.

All the Female Albino Wistar animals except control group were administered with Dexamethasone at a dose of 5mg/kg i.p. once a day for 12 days before 1hr. of test drug treatment.

2.7 Collection of Blood samples, Blood Glucose & Body Weight Determination:

Blood samples were withdrawn from tail tip of rats. Fasting blood glucose estimation and body weight measurement were done on 0, 6 & 12th day of the study. Blood glucose estimation can be done by one touch ACCU-CHECK Active Glucometer using glucose test strips.

On day 12th, blood was collected from retro-orbital plexus under mild ether anesthesia from overnight fasted rats and fasting blood sugar was estimated. After that body weight of animals was determined.

2.8 Biochemical Estimation:

Blood samples were with drawn for estimation of Blood glucose level, Serum Insulin level, Lipid profile (Total cholesterol, Triglycerides, HDL, LDL, VLDL) in the serum sample. After the end of respective treatment, animals were sacrificed with high dose of anaesthesia and the tests organs

DIRECTOR Yashoda Technical Campus Satara

were removed, weighed and stored at -20°C for further antioxidant and histopathological studies.

2.9 Experimental Design:

2.9.1 Acute Toxicity Study:

Acute toxicity study was carried out for the *Eucalyptus globulus* Plant by adapting fixed dose method of CPCSEA, OECD guidelines no. 423. Healthy Female Albino Wistar rats were randomly divided into 4 groups with 3 animals in each group. The animals were kept fasted overnight providing only water, after which the Methanolic leaves extract of *Eucalyptus globulus* Plant were administered orally with increasing doses (100, 500, 1000 and 2000mg/kg/day) by intra gastric tube to determine the safe doses by up and down staircase method. The animals were observed continuously for 1 hr., then frequently for 4 hrs. and later at the end of 24 hrs. for general neurological & behavioural or autonomic profile. Further, one group was administered high dose of *Eucalyptus globulus* Plant leaves extract orally once a day for 15 days and observed for any lethality and death.

2.9.2 Hypoglycemic Evaluation:

For Hypoglycemic evaluation, Female Albino Wistar Rats were used and divided into four groups of six animals in each group. Animals were kept fasted overnight (14hrs.) before treatment.

Group I- (Control) rats received vehicle that was 5% Tween 80 (10ml/kg/day p.o.).

Group II- (Test1) rats received Methanolic leaves extract of *Eucalyptus globulus* Plant (200mg/kg/day p.o.) solubilized in 5% Tween 80 solution.

Group III- (Test2) rats received Methanolic leaves extract of *Eucalyptus globulus* Plant (400mg/kg/day p.o.) solubilized in 5% Tween 80 solution.

Group IV- (Test3) rats received Methanolic leaves extract of *Eucalyptus globulus* Plant (600mg/kg/day p.o.) solubilized in 5% Tween 80 solution.

Blood glucose was estimated on 0, 1, 2, 3 & 4th day of the treatment using the ACCU-CHECK Active Glucometer.

2.9.3 Oral Glucose Tolerance Test:

For OGTT evaluation, Female Albino Wistar Rats were used and divided into five groups of six animals in each group. Animals were kept fasted overnight (14hrs.) before treatment.

Group I- (Control) rats received vehicle that was D-Glucose (2gm/kg p.o.).

Group II- (Standard) rats received Glibenclamide (0.5mg/kg i.p.).

Group III- (Test1) rats received Methanolic leaves extract of *Eucalyptus globulus* Plant (200mg/kg p.o.) solubilized in 5% Tween 80 solution.

Group IV- (Test2) rats received Methanolic leaves extract of *Eucalyptus globulus* Plant (400mg/kg p.o.) solubilized in 5% Tween 80 solution.

Group V- (Test3) rats received Methanolic leaves extract of *Eucalyptus globulus* Plant (600mg/kg p.o.) solubilized in 5% Tween 80 solution.

D-glucose (2gm/kg p.o.) was administered to all the rats after one hour of administration of different treatments. Blood glucose was estimated at 30, 60, 90 & 120 min after D-Glucose treatment using the ACCU-CHECK Active Glucometer.

2.9.4 Dexamethasone-Induced Rodent Model of Diabetes:

The Female Albino Wistar rats were divided into six groups of six rats in each. All the animals were fasted overnight (14hrs.) before the treatment of Dexamethasone. All the Female Albino Wistar animals except control group were administered with Dexamethasone at a dose of 5mg/kg i.p. once a day for 12 days. Standard & test drug treatment was started after 1hr. of Dexamethasone administration till the end of study.

Group I- (Control) rats received vehicle that was 5% Tween 80 solution (10ml/kg/day p.o.).

Group II- (Toxic Control) rats received Dexamethasone (5mg/kg/day i.p.).

Group III- (Standard) rats received Metformin (40mg/kg/day p.o.) solubilized in distilled water.

Group IV- (Test1) rats received Methanolic leaves extract of *Eucalyptus globulus* Plant (200mg/kg/day p.o.) solubilized in 5% Tween 80 solution.

Group V- (Test2) rats received Methanolic leaves extract of *Eucalyptus globulus* Plant (400mg/kg/day p.o.) solubilized in 5% Tween 80 solution.

Group VI- (Test3) rats received Methanolic leaves extract of *Eucalyptus globules* Plant (600mg/kg/day p.o.) solubilized in 5% Tween 80 solution.

2.10 Statistical Analysis:

All values of results were presented as mean ± standard error of mean (SEM). The statistical analysis involving two groups was evaluated by means of Student's *t*-test, whereas one way analysis of variance (ANOVA) followed by Dunnett's multiple comparison posttest was used for statistical comparison between control and various treated groups. Statistical significance was accepted at the $p < 0.05$ values.

3. RESULTS

3.1 Quantitative Phytochemical Test:

The yield of extract was found to be 4.8%. The phytochemical analysis revealed that the Methanolic leaves extract of *Eucalyptus globulus* Plant contains a significant amount of volatile oils, carbohydrates, alkaloids, glycosides, polyphenols, flavonoids, tannins, propanoids, sterols and terpenoids, ketones, alcohols.

3.2 Acute Toxicity Study:

In the LD50 value determination, we observed that the *Eucalyptus globulus* Plant extract was safe to use in animals. There was no change in neurological, behavioural

YASHODA 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

or autonomic, no lethality or toxic reactions were found with the selected doses (100, 500, 1000 and 2000mg/kg/day p.o.) until the end of study period. Therefore 200, 400 & 600mg/kg was selected for all in-vivo experiments as maximal dose.

3.3 Hypoglycemic Effect of Methanolic Leaves Extract of *Eucalyptus globulus* Plant in Normal Rats:

The results from the study clearly indicated that the administration of Methanolic leaves extract of *Eucalyptus globulus* Plant at the dose 200, 400 and 600mg/kg/day p.o. reduced the blood glucose level significantly on 4th day as compared with normal control group.

Table 1: Hypoglycemic Effect of Methanolic Leaves Extract of *Eucalyptus globulus* Plant in Normal Rats

Sr. no.	Groups (n=6)	Fasting Blood Glucose Level (mg/dl)				
		0th day	1st day	2nd day	3rd day	4th day
I	Control	86.00±0.73	85.16±0.65	83.50±1.05	82.83±1.07	82.33±0.49
II	Test group with Low dose of E. g. Plant leaves extract	86.66±1.05	85.16±0.60	81.00±0.57	79.33±0.33	78.50±0.42*
III	Test group with Intermediate dose of E. g. Plant leaves extract	85.83±1.01	84.83±0.79	81.65±0.91	79.83±0.70	78.62±0.42*
IV	Test group with High dose of E. g. Plant leaves extract	86.16±0.70	83.50±0.67	80.16 ±0.47	78.55±0.67	75.33±0.95*

Values are mean ± SEM, n = 6, when compared with normal by using one way ANOVA followed by Dunnette's multiple comparison test. (*p < 0.05, **p < 0.01).

3.4 Effect of Methanolic Leaves Extract of *Eucalyptus globulus* Plant on the Oral Glucose Tolerance Test in Normal Rats:

The results from the study clearly indicated that the administration of Methanolic leaves extract of *Eucalyptus globulus* Plant at the dose (200, 400 and 600mg/kg p.o.) and Metformin (40mg/kg p.o.) reduced the blood glucose level (hyperglycemia due to glucose load 2g/kg p.o.) significantly after 60 min of administration, as compared with control group.

Table 2: Effect of Methanolic Leaves Extract of *Eucalyptus globulus* Plant on the Oral Glucose Tolerance Test in Normal Rats.

Sr. no.	Groups (n=6)	Fasting Blood Glucose Level (mg/dl) in min				
		0 min	30 min	60 min	90 min	120 min
I	Control	94.17±0.65	98.00±0.74	105.51±1.05	114.84±1.07	121.34±0.49
II	Standard	93.51±0.67	96.17±0.70	89.17±0.47*	88.51±0.67*	85.34±0.95**
III	Test group with Low dose ofE. g. Plant leaves extract	94.17±0.60	96.67±1.05	90.00±0.58	89.34±0.33	88.51±0.42*

Values are mean ± SEM, n = 6, when compared with normal by using one way ANOVA followed by Dunnette's multiple comparison test. (*p < 0.05, **p < 0.01).

3.5 Effect of Methanolic Leaves Extract of *Eucalyptus globulus* Plant on Body Weight of Diabetic Rats:

At the end of 12 days treatment, body weight was significantly decreased in toxic control group as compared with normal control group & significantly increased in Methanolic leaves extract of *Eucalyptus globulus* Plant at the dose (200, 400 and 600mg/kg/day p.o.) and standard drug Metformin (40mg/kg/day p.o.) treated group as compared with toxic control group.

3.6 Effect of Methanolic Leaves Extract of *Eucalyptus globulus* Plant on fasting blood glucose level in Diabetic Rats:

A marked rise in fasting blood glucose level was observed in toxic control group as compared with normal control group. The Methanolic leaves extract of *Eucalyptus globulus* Plant and standard drug Metformin (40mg/kg/day p.o.) treated group which produced a significant reduction in blood glucose level as compared with toxic control group. Methanolic leaves extract of *Eucalyptus globulus* Plant at the dose (200, 400 and 600mg/kg/day p.o.) exhibited a dose dependent significant antidiabetic potential on 6 & 12th days post treatment.

3.7 Effect of Methanolic Leaves Extract of *Eucalyptus globulus* Plant on Biochemical Parameters in Diabetic Rats

3.7.1 Serum Insulin Level

After 12 days of treatment period it was observed that decreased serum insulin level in toxic control group as compared with normal control group. Animals treated with Methanolic leaves extract of *Eucalyptus globulus* Plant at the dose (200, 400 and 600mg/kg/day p.o.) and standard drug Metformin (40mg/kg/day p.o.) treated group showed a significant increase in the serum insulin level as compared with toxic control group.

Values are mean ± SEM, n = 6, when compared with normal by using one way ANOVA followed by Dunnette's multiple comparison test. (*p < 0.05, **p < 0.01).

3.7.2 Serum Lipid Profile:

After 12 days of treatment period it was observed that increased level of CHL, LDL, VLDL, TG & decreased HDL level in toxic control group as compared with normal control group. Animals treated with Methanolic leaves extract of *Eucalyptus globulus* Plant at the dose (200, 400 and 600mg/kg/day p.o.) and standard drug Metformin (40mg/kg/day p.o.) treated group showed significant reductions in CHL, LDL, VLDL, TG & significant increase in HDL level as compared with toxic control group .

3.7.3 Antioxidant Activity:

3.7.3.1 For Liver:

Diabetes mellitus significantly reduced antioxidant enzymes level of CAT, POD, SOD & GPx. After 12 days of treatment period it was observed that reductions in level of antioxidant enzymes in toxic control group as compared with normal control group. Animals treated with Methanolic leaves extract of *Eucalyptus globulus* Plant at the dose (200, 400 and 600mg/kg/day p.o.) and standard drug Metformin (40mg/kg/day p.o.) showed significant increase in level of antioxidant enzymes like CAT, POD, SOD & GPx as compared with toxic control group.

4. DISCUSSION

4.1 Acute toxicity, Blood glucose level & Body weight Determination:

Globally, the rapid increase the incidence of type 2 DM poses a demand for the quest of novel therapeutic drugs necessitates addition of alternative medicine. As a result number of studies has been conducted to assess the utility of herbal medicine in type 2 DM. The present study was undertaken to evaluate the Antidiabetic Potential of Methanolic Leaves Extract of *Eucalyptus globulus* Plant in Dexamethasone -Induced Diabetic Albino Wistar Rats. In the LD50 value determination, we observed that the *Eucalyptus globulus* Plant extract was safe to use in animals. There was no change in neurological, behavioural or autonomic, no lethality or toxic reactions were found with the selected doses (100, 500, 1000 and 2000mg/kg/day p.o.) until the end of study period. Therefore 200, 400 & 600mg/kg was selected for all in-vivo experiments as maximal dose.

The results of Hypoglycemic study have shown that the Methanolic leaves extract of *Eucalyptus globulus* Plant at the dose 400, 600mg/kg/day has a marked hypoglycemic potential as compared with control group (Table 1).

The Oral glucose tolerance test in normoglycemic rats, blood glucose level was significantly greater in the glucose loaded control group. Methanolic leaves extract of *Eucalyptus globulus* Plant at the dose 200, 400 and 600mg/kgp.o. and Metformin (40mg/kg i.p.) reduced the blood glucose level and improved the impaired glucose tolerance (hyperglycemia due to glucose load 2g/kg p.o.) significantly after 60 min of administration, as compared with control group (Table 2).

Induction of diabetes by Dexamethasone leads to loss of body weight due to increased muscle wasting and loss of tissue proteins, whereas body weight of animals significantly increased in Methanolic leaves extract of *Eucalyptus globulus* Plant at the dose 200, 400 and 600mg/kg/day p.o and standard drug Metformin treated group as compared with toxic control group (Table 3).

Dexamethasone is a synthetic glucocorticoid whose chronic exposure to high doses cause insulin resistance. The results of the antidiabetic study have shown a significant ($p < 0.05$) difference between the 0, 6 & 12th days fasting blood glucose levels of Methanolic leaves extract of *Eucalyptus globulus* Plant at the dose 200, 400 and 600mg/kg/day p.o. and standard drug Metformin (40mg/kg/day i.p.) treated group as compared with toxic control group (Table 4). The possible mechanism of antidiabetic action of Methanolic extract may be by increasing the pancreatic secretion of insulin from the existing beta cells, by its release from the bound form & increase in muscle glucose uptake by increased liver glucose metabolism.

4.2 Biochemical Parameters Analysis:

In Dexamethasone-induced diabetes mellitus showed improvement in biochemical parameters. Methanolic leaves extract of *Eucalyptus globulus* Plant and standard drug treated group showed significant increase in serum insulin level as compared with toxic control group (Table 5). The possible mechanism of action of Methanolic leaves extract may be by increasing the pancreatic secretion of insulin from the existing beta cells, by its release from the bound form.

The serum lipid levels are generally high in diabetes; mapping a major risk factor for coronary heart disease. Chronic exposure to Dexamethasone leads to insulin resistance promotes the increase of hormone sensitive lipase activity. Due to alteration in metabolic parameters leads to an increase in fatty acids mobilizations from adipocytes and increase in hepatic synthesis of triglycerides, which are released into the bloodstream as VLDL, LDL cholesterol. HDL cholesterols enriched with triglycerides which are rapidly hydrolysed and because of their increased catabolism, the blood level of HDL decreases. In a result of lipid profile, marked decrease in total cholesterol, LDL, VLDL and triglycerides was observed, while increase in HDL cholesterol which reduces the risk of atherosclerosis has been observed in Methanolic leaves extract & standard drug treated group which suggest that HDL is inversely related to the total body cholesterol as compared with toxic control group (Table 6). These results could thus reflect the ability of Plant extract improve the tissue sensitivity to insulin. Thus reducing the hormone sensitive lipase activity and increasing the lipoprotein lipase activity, resulting in a decrease of lipolysis these leading to hypolipidemic activity. Flavonoids have been shown to improve dyslipidemia. Thus the hypolipidemic effect of Methanolic leaves extract of *Eucalyptus globulus* Plant could be attribute to the flavonoids contained in the

DIRECTOR
Yashoda Technical Campus
Satara

Plant. Further these extract could effectively prevent cardiovascular complications related to diabetic dyslipidemia.

In antioxidants study, Diabetes mellitus reduces the antioxidant enzymes level like CAT, POD, SOD & GPx. The increase in the levels of lipid peroxidation might be indicative of a decrease in the enzymatic antioxidant defense mechanism. Animals treated with Methanolic leaves extract of *Eucalyptus globulus* Plant & standard drug treated group showed significant increase in antioxidant enzymes level like CAT, POD, SOD & GPx as compared with toxic control group (Table7).

4.3 Histopathological Examination:

In histopathological study, the fine section of Dexamethasone induced diabetic rats liver on microscopic examination using H & E,100 & 400 X stain showed the normal architecture without steatosis in the normal control group, partial loss of architecture with extensive microvascular steatosis in the toxic control group, normal architecture with microvascular steatosis in the test group i.e. Methanolic leaves extract of *Eucalyptus globulus* Plant treated group, normal architecture with focal microvascular steatosis in the test group i.e. Methanolic leaves extract of *Eucalyptus globulus* Plant treated group, normal architecture without steatosis in the Metformin treated standard group (Table 8).

The results obtained with the Methanolic leaves extract of *Eucalyptus globulus* Plant treatment in chronic diabetic model further clarified the antidiabetic potential of the extract. After 12 days of Methanolic leaves extract of *Eucalyptus globulus* Plant treatment, reductions in elevated blood glucose level,, gain in body weight, hypoglycemic activity, oral glucose tolerance, normalization in altered biochemical parameters & regeneration of damaged tissue of liver were observed, which comparable with that of the toxic control group as well as standard drug Metformin treated group. These effects could be due to the potent bioactive Polyphenol Ellagitannins present in the Plant.

5. CONCLUSION

In conclusion, it can be stated that the Methanolic leaves extract of *Eucalyptus globulus* Plant the source of Ellagitannins has beneficial effects in reducing the elevated blood glucose level as well as gained body weight, hypoglycemic activity, significant oral glucose tolerance, hepatoprotective & normalization in altered biochemical parameters of Dexamethasone-induced diabetic rats. *Eucalyptus globulus* Plant the source of Ellagitannins associated with the stimulation of insulin secretion and enhancement of muscle glucose uptake and metabolism due to regeneration in damaged tissue of liver. These effects could be due to the potent bioactive Polyphenol Ellagitannins present in the Plant. Thus justifying the claim made by ayurvedic classics. Therefore, *Eucalyptus globulus*Plant the source of Ellagitannins represents an effective antidiabetic dietary adjunct for the treatment of diabetes and a potential source for discovery of new orally active agent for future diabetes therapy.

A B S T R A C T

Catalepsy is a symptom resulting from problems with the nervous system, and causes muscular rigidity. People with the symptoms may also be less sensitive to touch and have a decreased sensitivity to pain. Catalepsy generally causes people to be unresponsive to speech. It is similar to catatonia, a condition marked by strange movements, lack of movement, and/or general non responsiveness. However, it typically has an underlying physiological cause and does not cause stereotyped movements.

Keywords-Catalepsy, Haloperidol, Scopolamine, Hydroxytyrosol.

INTRODUCTION-

Catalepsy is a condition characterized by inactivity, decreased responsiveness to stimuli and a tendency to maintain an immobile posture. It may be associated with the nervous system drug toxicity, psychotic disorders and other conditions. [1] Catalepsy is the neurodegenerative disease of unknown etiology and characterized by motor symptoms of tremor, rigidity, bradykinesia, and postural instability. Catalepsy is characterized by an abnormal basal ganglia activity. Non-motor comorbidities, such as cognitive impairments (the comorbidity of anxiety and depression like Parkinson's disease) are likely the result of an intricate interplay of multi-system degenerations and neurotransmitter deficiencies extending beyond the loss of dopaminergic nigral neurons. [1][3]

It is an iatrogenic disorder that occurs following chronic anti-psychotic drug treatment that is characterized by motor symptoms dysfunction that is extrapyramidal side effects. When the effect extends beyond the oro-facial region there may be involuntary laryngeal changes and consequent vocalization. Breathing can be affected, as well as the flexion and extension of shoulders, fingers, wrists, hips, knees, ankles and toes. These effects are challenging in social settings, but can also interrupt daily life and personal care. These symptoms are rarely present during sleep and can be halted during attention tasks, however most commonly individuals affected by tardive dyskinesia are not aware of the presence of their symptoms or their ability to voluntarily modulate symptoms. [1][2]

SYMPTOMS OF CATALEPSY

- Extremely rigid body posture
- Decreased sensitivity to pain
- Limbs that stay in the same position when they are moved
- Slower bodily functions
- Particularly breathing
- Decreased muscle control, or complete loss of muscle control (Costall & Naylor, 1974).

DIRECTOR
Yashoda Technical Campus
Satara

Causes

- Biochemical factor: Low level of neurotransmitter Serotonin, dopamine, norepinephrine.
- Genetic factor: Family member with schizophrenia disorder or psychotic disorder.
- Serious illness: neurological disorders such as Parkinson's disease and epilepsy.
- Substance risk for catalepsy: Medication, substance abuse, drug withdrawal.

MATERIALS AND METHOD-

Animals and housing condition*:*

The experiments will be conducted with Wistar male rats of 110–250 g and 2–3 months old. Female rats are excluded from the present study since estrogen has been reported to possess neuroprotective property and this might mask development of Catalepsy. These animals will be procured from registered breeder and will be acquainted in the quarantine area for one week. After acquaintance, animals will be transferred to the standard laboratory conditions of22±2°Ctemperature,50±15%relativehumidity,12hr.dark/12hr.light)cycleandtheanimals will have free access to pellet diet & water will be provided *ad libitum*. The study protocol will be presented to the IAEC for approval (Dhingra, 2017).

Drug and Reagent- Hydroxytyrosol was acquired from Rajesh Chemicals CO. Mumbai. Scopolamine was obtained from Recipharm Pharmaservices Pvt. Ltd. Bengalore. Haloperidol (serenac 0.25) tablets were procured from RPG Life science Ltd. Gujarat. All other chemicals used were of analytical grade.

Study Design-

The 36 male Albino Wistar rats were divided into six groups: group 1 (control group), group 2 (Catalepsy inducedgroup), group 3 (standard group), groups 4, 5 and 6 (treatment groups). Following Haloperidol administration, standard group was administered with Scopolamine at a dose of 1 mg/kg in oral and treatment groups 4, 5 and 6 were administered Hydroxytyrosol with the dose of 25 mg/kg (Low dose) and 50 mg/kg(Intermediate dose) and 100 mg/kg (High dose) respectively oral for 21 days.

EXPERIMENTAL PROCEDURES

Haloperidol induced catalepsy

A cataleptic behavior will be measured with a high bar test method. Catalepsy score will be measured each hour for 4 h after haloperidol administration, by gently placing both the forepaws of the rat over a metal bar (diameter 2–5 mm) situated 6 cm above the tabletop. The intensity of catalepsy will be assessed by counting the time in seconds until the rat brought both forepaws down to the tabletop, with a maximum cutoff time of 180 s. Finally, scores at different time points (0, 60, 120, 180 and 240 min after haloperidol injection) will be added and expressed as a cumulative catalepsy score for comparison purpose. In all the experiments, the scorer will be blind to the treatment given to the rat. (Naidu & Kulkarni, 2002) (Sanberg et al., 1988).

SCORING OF CATALEPSY –

Cataleptic animal maintaining this position for a period of time dependent upon the degree of catalepsy. If the animal maintained the imposed posture for at least 20s it was said to be cataleptic and given one point.

Scoring will be modified from that used by Costall and Naylor (1974). Animals maintaining the cataleptic posture from 0 s to 10 s scored 0; 10 s to 30 s = 1; 30 s to l min=2; l min to 2 min=3; 2 min to 3 min=4; 3 min to ∞ =5. Animals will be tested for catalepsy 0.5, 1.0, 2.0,

3.0 and 4.0h after haloperidol treatment (Costall & Naylor, 1974)

Statistical Analysis

The statistical analysed by one way analysis of variance (ANOVA) followed by Tukey's multiple comparison test and Dunnett's multiple comparison test. The statistical analyzed by two-way analysis variance followed by Bonferroni Posttests. Data expressed as group mean with standard error mean (mean ± SEM). Data was also compared within group; statistical analysis was done by using paired t-test. P<0.05 was considered to be significant. Statistical analysis and graphical presentation of data was done with Graphed prism-5 software.

CONCLUSION

In normalizing the various parameters in Catalepsy induced rats, the impact of Hydroxytyrosol therapy with medium (50mg/kg) and high(100mg/kg)was observed to be similar with standard treatment.

In haloperidol induced Catalepsy animals, Hydroxytyrosol recovered the dopamine Serotonin Superoxide dismutase level. Thus, Hydroxytyrosol might be beneficial in managing Catalepsyconditionduetonumerouspharmacologicalactivities includingantioxidant,anticancer,woundhealing,andprotective action against hyperglycemia and hyperlipidemia. By their rich antioxidant activity, Hydroxytyrosol likely promoted protective action against the Catalepsy condition.

Discussion-

Neuroleptics produce two main type of motor disturbances in humans-catalepsy and tardive dyskinesia, collectively called as extrapyramidal side effects, which result directly or indirectly from the blockade of dopamine D2 receptors. These effects constitute the main disadvantages or the therapeutic use of typical neuroleptics. Catalepsy is a characteristic consequence of anti-psychotic drug administration to rats. Most commonly the drug-induced cataleptic effect in rats has been characterized as a reflection of the potential of these drugs to produce extra-pyramidal side effects in humans including Parkinsonianism, akanthesia and dyskinesia.

Haloperidol treatment for 21 successive days significantly induced catalepsy in rats, as indicated by significant increase immobility. This is also supported by the earlier study where haloperidol (1mg/kg) administered once daily in the morning for a period of 21 successive days produced decrease in movements in rats. It has been reported in the literature that chronic use of neuroleptics may lead to imbalance in the production and detoxification of free radicals. Catalepsy is also characterized by accumulation of oxidative damage mainly in the brain due to its high energy metabolism and the relative low activity of antioxidative defence mechanism.

Many factors are proposed for causing catalepsy, such as abnormalities in function of neurotransmitters receptors (e.g., Adenylyl cyclase-cAMP pathway), dysregulation of hypothalamic pituitary adrenal axis (cortisol), changes in the brain monoaminergic transmission (e.g.,5-HydroxyTryptamine, Dopamine, Norepinephrine), increased proinflammatory cytokines (e.g., interleukin-6, tumor necrosis factor-α), increased oxidative stress (e.g., lipid and DNA damage), increased nitric oxide (NO).

In this study, we used two animal models. Actophotometer and high bar test. All the models are widely accepted behavior models for assessing pharmacological anticataleptic activity. All animal were treated with Hydroxytyrosol along with inducer Haloperidol for every model and activity was check on every (i.e., 7th,14th,21th).

DIRECTOR
Yashoda Technical Campus
Satara

Hydroxytyrosol showed significant anticataleptic activity at doses of 25mg/kg,50mg/kg, and 100mg/kg.

ABSTRACT:
The maestro is the scientific leader in developing state-of-the-art chemical stimulation software for use in pharmaceutical, biotechnology, and, materials science research. Maestro is the portal to all of maestros computational technology-far more than just a user interface, Maestro also helps researches organize and analyz data. Maestro is the culmination of years of research and development. by working closely to be the user environment that is both intuitive and allows our users to get work done efficiently. The typical bacteria form a biofilm which barrier for antibiotics and other harmful substances. The capacity of phages to penetrate that. In the study, we showed that Galloflavin and Ellagic acid increased SIRT6 activity and decreased the expression of SIRT6 associated proteins involved in cancer development. Taken together, Galloflavin and Ellagic acid targeting SIRT6 activity may provide a new insight in the development of anti-cancer therapy. As cetuximab exhibits several anticancer mechanisms, in vivo studies are needed to explore and confirm the effects of combining osimertinib with cetuximab in the L858R/T790M/L792H-mutant pattern.

KEYWORDS: Molecular docking, drug discovery, Maestro software.

1. INTRODUCTION:
Computer-aided drug design uses computational approaches to discover, develop, and analyze drugs and similar biologically active molecules. The ligand-based computer-aided drug discovery (LB-CADD) approach involves the analysis of ligands known to interact with a target of interest. These methods use a set of reference structures collected from compounds known to interact with a target of interest and analyze their 2D or 3D structures. The basic objective of these methods is to predict the nature and strength of binding of given molecule a target. The program renders the rover in a 3D environment. The program features the jet Propulsion Laboratory testing facility. Spirit's landing site to explore. Data from the Spirit and Opportunity's landing site must be downloaded externally from the Maestro website and imported into the program [1-3].

REVIEW OF LITERATURE:
Wieslaw swietnicki and et al used Maestro software to check the in silico analysis of bacteriophage tail tubular suggests a putative sugar binding site and a catalytic mechanism. In silico analysis was performed on the structure of a base tailplate protein gp31 from *Klebsiella pneumonia* bacteriophage KP32 (PDB: 5MU4) which shows activity towards maltose but not trehalose. The first region clearly favored maltose during the docking phase while the second one allowed for the energetically-equivalent binding of trehalose [4].

Carmen Diez-Simon and et al used Maestro software to check the comparison of volatile trapping techniques for the comprehensive analysis of food flavourings by gas chromatography-mass spectrometry. Trapping volatiles is a convenient way to study aroma compounds but it is important to determine which volatile trapping method is most comprehensive in extracting the most relevant aroma components when investigating complex food products. Comprehensiveness and repeatability were compared and SBSE proved particularly suitable for extracting components such as polysulfides, pyrazines and terpene alcohols [5].

Jae Myung Park and et al used Maestro software to check the A dodecapeptide selected by phage display as a potential theranostic probe for colon cancers. The peptide probe maintained binding affinity even after serum incubation. For therapeutic applications, this peptide probe was conjugated to hematoporphyrin, a photosensitizer, which showed a significantly enhanced cellular uptake and high photodynamic effect to kill tumor cells [6].

K. Wan Yusof and et al used Maestro software to check the developing a UiTM (Perlis) web-based of building space management system: A preliminary study in locating a specified space/room area using open source GIS tool. The preliminary result of the study shows that the spaces and room areas in the building can be mapped out digitaly and it can also be made available to be accessed through the web for the resident of the university [7].

Iman Mirmazloum and et al used Maestro software to check the oxidative stress level and dehydrin gene expression pattern differentiate two contrasting cucumber F1 hybrids under high fertigation treatment. According to RT-qPCR transcript levels of several antioxidant enzymes genes (ascorbate peroxidase, glytathione reductase and glutathione peroxidase) were significantly higher in 'Joker' compared to 'Oitol'. Antioxidant capacity increased in both hybrids with strong characteristics differences favoring 'Oital' plants [8].

Minna Rahnasto-Rilla and et al used Maestro software to check the effects of galloflavin and ellagic acid on sirtuin 6 and its anti-tumorigenic activities. Ellagic acid increased the deacetylase activity of SIRT6 by up to 50-fold; it showed moderate inhibition of SIRT1-3. Galloflavin and ellagic acid showed anti-proliferative effects in Caco2. In this study, we showed that Galloflavin and Ellagic acid increased SIRT6 activity and decreased the expression of SIRT6 associated proteins involved in cancer development. Taken together, Galloflavin and Ellagic acid targeting SIRT6 activity may provide a new insight in the development ofanti-cancer therapy [9].

Susan M. Burden-Gulley and et al used Maestro software to check the A novel molecural diagnostic of glioblastomas: Detection of an extracellular fragment of protein tyrosine phosphate μ[1,2]. The activity of the receptors tyrosine kinase is normally kept in check by the opposing activity of RPTPs such as PTPμ, which are important regulstors of adhesion-dependent signals [10].
H. Bounouria and et al used Maestro software to check the study of heavy metal assessment in the gharb plain along sebou river (morocco) using k0-NAA method triga mark II research reactor. The Ko-mothod activation analysis (ko-NAA) was used in order to determine the concentration of major and trace elements in sediment samples collected from different sites in the Gharb plain aong the Sebou River (morocco). The comparison with other sussequent studies on Sebou River gives an idea about the temporal evolution of heavy metal contamination at national scale [11].

Prasad G. Jamkhande and et al used Maestro software to check the software based approaches for drug designing and development: A systemtic review on commonly used software and its applications. Drug Discovery includes drug designing and development, is a multifarious and expensive endeavor, where least number of drugs that pass the clinical trials makes it to market. Novel software based methods such as molecular modeling; structure-based drug design, structure-based virtual screening, ligand interaction and molecular dynamics are considered to be powerful tool for investigation of pharmacokinetics and pharmacodyanamic properties of drug, and structural activity relationship between ligand and its target [12].

Sejal P. Gandhi and et al used Maestro software to check the computational data og phytoconstituents from *Hibicus rosa-sinensis* on various anti-obesity targets. Molecur docking analysis of twenty two phytoconstitient from *rosa-sinensis*, against seven targets of obesity like pancreatic, hormones as ghrelin, leptin and protein as SCH1and MCH is detailed in this data article. Chemical structures of phytoconstituents were downloaded from PubChem[2][13].

Sabrin R.M. Ibrahim and et al used Maestro software to check the mangostanaxanthone VIIII, a new xanthone from *Garcinia mangostana* pericaps, α-amylase inhibitory activity, and molecular docking studies. The α-amylase inhibitory potential of the isolated metabolites was evaluated. The molecular docking study of the tested metabolites was estimated to shade up therational explanation of the α-amylaseinhibitory activity results [14].

Amin O. Elzupir and et al used Maestro software to check the inhibition of SARS-CoV-2 main protease $3CL^{pro}$ by means of α-ketoamideand pyridine-containing pharmaceuticals usingin silico molecular docking. This study report for the firsttime a compound that could be binding to ALA^{285}, the new residue reaulting from genetic modification of $3CL^{pro}$ of SARS-CoV-2 that hasincresed its catalytic activity 3, 6-fold compare with its predecessor $3CL^{pro}$ of SARA-CoV [15].

El-Sayed I. El-Desoky and et al Maestro software to check the synthesis, biological evaluation and *in silico* molecular docking of novel 1-hydroxy-naphthyl substituted heterocycles. Chalcone **3c**, naphtyl pyrazoline **6b** and hyadroxycoumarin **13** exhibited the higher activity as antioxidants. *In silico* molecular docking of pyrazoline **6b** endorsed its proper binding at the active site of the 2EX6 enzyme which explains its potent antibacterial activity in comparison with standard ampicillin [16].

Raveendra Melanvanki and et al used Maestro software to check the investigation of interaction between boronic acids and sugar: effect of structural change of sugars on binding affinity using steady state and time resolved fluorecencespectroscopy and molecular docking. Binding interactions of boronic acid derivatives viz. 2-Methylphenylboronic acid (B1) and 3-Methoxyphenylboronic acid (B2) withmono saccharides (arabinose, fructose and galactose) and (sucrose, lactose and maltose) in aqueous condition at pH 7.4 by means of fluorescence spectroscopy is reported in the present investigation [17].

Massound Amanlou and et al used Maestro software to check the anti-HCV anti-malaria agent, potential candidates to repurpose for coronavirus infection: Virtual screening, molecular docking, and molecular dynamics simulation study. Concurrent the viral entranceto the host cell, its antigen will exposure to antigen presentation cells (APC) and then identified by cytotoxic T lymphocytes (CTIs). But reducing the number of CD4and CD8 cells in COVID-19 patients prevents Tcell proliferation and activity [18].

Mohammed M. Matin and et al used Maestro software to check the novel mannopyranoside esters as sterol 14α-demethylase inhibitors: synthesis, PASS prediction, molecular docking, and pharmacokinetic studies. Te activity spectra analysis along with *in vitro* antimicrobial evaluation clearly indicated that those novel MDM estershad better antifungal activitites over antibacterial agents [19].

Andrea Barni and et al used Maestro software to check the Mini-factories for close-to-customer manufacturing of customized furniture: from concept to real demo. During demonstration, customers had the possibility to access the shop, configure their products and see them manufactured in quasi-real time. The promising results of the demonstration activity pave the way for further exploration of the proposed concept [20].

Shobana Sundar and et al used Maestro software to check the Molecular docking, molecular dynamics and MM/PBSA studies of FDA approved drugs for protein kinase a of Mycobacterium tuberculosis; application insights of drug repurposing. Tuberculosis (TB) is a deadly disease, and novel treatment strategies are required to combat it. Repurposing of existing Food and Drug Administration (FDA) approved drugs against Mycobacterium tuberculosis (Mtb) proteinscould be beneficial for TB treatment [21].

CONCLUSION:

After completion of review, it was found that the Meostro molecular docking softwear is very important for Insilico analysis of different pharmaceutical compounds, it aslo helps in determine the molecular interaction, Molecular binding.

This softwear also useful to check the pharmacological activity, therapeutic activities such as Anti tumorigenic activity, Anti HIV activity, Anti malarial activity ETC. After literature review it was seen that numbers of researchers suggest the Meostro softer used for molecular binding, molecular interaction and insilico analytical activity.

Department of Pharmaceutics, YSPM's, Yashoda Technical Campus, Satara, India 415003

Received: 19 January 2021 Revised: 13 July 2021 Accepted: 25 July 2021

Abstract

Microsponges drug delivery system composed of porous microsphere. They are tiny sponges-like spherical particles with a larger porous surface. Morever they may enhance stability, reduce side effect and modify drug release favorably. Microsponges technology has many favorable characteristics, which make it a versatile drug delivery system. Microsponge system are based on microscopic, polymer-based microsphere that can suspend or entrap a wide variety of substance, and it can be incorporated into a formulated product such as a gel, cream, liquid or powder. The outer surface is typically porous, allowing a sustained floe of substance out of the sphere. Microsponges are designated to deliver a pharmaceutical active ingredient efficiently at the minimum dose and also to enhance stability, reduce side effect, and modify drug release.

Keywords: Controlled release, Healthcare system, Microsponges, Microsponges Delivery System

Introduction

One of the major challenges in pharmaceutical industry is to control the release of a drug at the specific organ in the body. Now days there are various systems are for targeting the delivery of a drug to a specific organ eg.trasdermal delivery system (Kalbhare et al., 2020). But the transdermal system are not proven for the delivery of the drugs which target the skin. For gastric cancer, there are no systems available which give local effect along with the controlled release of drug. Therefore it is a challenging area for the research work. Microsponges is a type of drug delivery system that enables controlled release and transport of active ingredients too the target organ.

The microsponge drug delivery system was invented by Won in 1987, and the first patent was assigned to Advanced Polymer System. This industry formulated different types of procedures which are applied in the cosmetic and pharmaceutical industry (Jadhav et al., 2013). Microsponge drug delivery systems are polymeric delivery systems composed of porous microspheres. They are small sponge like spherical structures that consist of a countless number of internally connected voids with a larger pores. It consists of non-collapsible structures. Moreover, they increase stability, reduce side effects and transform drug release. Because of the larger porous surface, the drug is released in specific manner. Microsponges have a number of favourable characteristics for targeted drug delivery. Microsponge drug delivery is based on polymeric microscopic spheres that can entrap and suspend wide variety of substances, and thenthey can be incorporated into a formulation such as a cream, gel, or powder. Microsponge drug delivery systemcan increase the efficacy, safety andproduct stability and improve the properties of the formulation in an effective manner (Jadhav et al., 2013; Kaity et al., 2010). Depending upon the size, pore length and pore volume, the microsponge drug delivery system releases the active ingredient.The release of the active ingredient depends on the rubbing, temperature and pH.Microsponges have the ability to absorb the load of polymers and active ingredients in the particles on their surface. Mostly microsponge systems are often used in the transdermal route (Mandavaet al., 2012; Barkai et al., 1990).

DIRECTOR Yashoda Technical Campus Satara

The average size of the microsponges delivery system is in the range 5µm to 300µm in diameter size and a typical 25µm to 250000µm. The surface size of the microsponges varies 20 to 500 µm /g and pore volume range 0.1 to 0.3cm/g. This results in a large reservoir within each microsponge, which can be loaded with up to its own weight of active agent (Jadhav et al., 2013; Kaity et al., 2010; Embil et al., 1996). These pores can entrap large range of drug and other ingredients like emollients, fragrances, essential oils, sunscreens, anti-inflammatory agents. These formulations that can be applied into the targeted region and this entrapped material gets delivered to the skin and controls therelease of the drug.

Potential characters of microsponge

Microsponges are stable at pH range from 1-11 and at high temperatures Microsponges have good compatibility with different type of polymer and ingredients. They also have high entraptment efficiency up to 60-70%. The pore size of microsponges is small so that it prevents the penetration of bacteria. Microsponges does not require sterilization and the addition of preservatives. The system is cost effective and can be used for the long term treatment. The polymeric design of the microsponges is mainly utilized for the controlling the drug release for given period of time and also being used for targeting specific region.

Benefits of microsponges

The microsponges can enhance product performance and also extend the release of drug upto 12 hours. They reduce irritation, increase patient compliance and improve product elegance. Microsponges increase the physical, chemical, thermal stability of drugs and absorb the oil upto 6 times their weight. Because of flexibility of microsponges they can act as novel drug delivery systems. Microsponges are non-irritating, non-mutagenic, non-allergenic and non-toxi. Microsponges allow the incorporation of immiscible products.Microsponges can improve bioavailability of some drugs.

Method of preparation of microsponge

Preparation of Microsponges involves two steps which are liquid-liquid suspension polymerization and quasi emulsion solvent diffusion techniques or w/o/w emulsion technique that can be based on physico chemical properties of drug.

Liquid-liquid suspension polymerization technique

The porous polymeric microspheres can be prepared by liquid-liquid suspension polymerization method. In this method, immiscible polymers are first dissolved with active moities in a suitable solvent. The aqueous phase consist of additives like surfactant, suspending agents to form of suspension. The polymerization process is activated by increasing the temperature. Following this process, the development of reservoir system contributes to the formation of the porous structure. The solvent is then removed and the spherical porous structured microspheres are formed. These formed microspheres are known as microsponges (Burton et al., 2002; Chardeet al., 2013). If the drug is not suitable for the one step procedure mentioned above, then two-step process will be used for polymerization.

Quasi-emulsion solvent diffusion

By using quasi-emulsion solvent diffusion technique porous microsponges can be prepared.In this technique, the first phase is prepared by using eudragit and ethyl alcohol. Then, the active ingredient is added slowly in to the above phase and dissolved. The plasticizers like triethylcitrate (TEC) also added to impart plasticity. The internal phase is poured in the external phase which contains PVA and distilled water with continuous stirring for 2 hours. The product is washed and dried in a hot air oven at 40°C for 12 hr (Çomoğluet al., 2003; Kumariet al., 2016).

w/o/w solvent diffusion

Microsponges can be prepared by double emulsion technique using sodium chloride as a porogenic solution. After that the solution of ethyl cellulose, eudragit and active ingredient in ethanol and dichloromethane is prepared. 1% (w/v) Aqueous solution is prepared using sufficient amount of Span. An aqueous polyvinyl alcohol solution and mucoadhesive polymer is prepared separately and previously prepared w/o emulsion is added to it. This w/o/w emulsion was stirred for 8 hr. The microsponges were obtained by filtration and dried at 60°C in the hot air oven and stored in dessicator till use. A compliation of the advantages and disadvantages of various methodologies used for preparation of microsponges (Table 1).

Drug release mechanism of microsponges

The active moieties are entrapped in porous microspheres. The microsponges consist of an open structure so that active ingredients are free to move through vehicle until equilibrium is attained and vehicle becomes saturated. This results in flow of the drug from the microsponge to the skin.The microsponges are then retained on the surface of the skin and will continue the drug release to the skin and provide a prolonged release for longer period of time. If the drug is freely soluble in the vehicle, the final product will not provide the desired drug release. Therefore, while formulating microsponge, it is important to choose a vehicle which has minimum solubilizing power of the active moities.

YASHODA TECHNICAL CAMPUS SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Table 1. A compilation of the advantages and disadvantages of various methodologies used for preparation of microsponges

Method	Advantages	Disadvantages
Liquid--liquid suspension polymerization	Can be suitably modified to one step or two step methods for drug loading	Probable entrapment of unreacted monomers and solvent traces. Non-uniform structure. Requires long time for the reaction of monomers. Requires two-step method for thermosensitive drugs that has low drug loading efficiency
Quasi-emulsion solvent diffusion	No monomer entrapment. Low solvent traces. High drug loading. No exposure of drug to ambient condition. Size of microsponges can be easily controlled by controlling the stirring. Spherical particles	Cannot be used for the loading of water-soluble drugs. Requires long time for the reaction of monomers. Drug should be soluble in a volatile water-soluble solvent
w/o/w emulsion solvent diffusion	Efficient for loading water-insoluble drugs. Can be used to entrap proteins and peptides	Uses water-insoluble surfactants that can be present as residues in the resultant microsponges
Addition of porogen	Highly porous structure with nicely distributed and interconnected pores	May cause disruption in structure
o/o emulsion solvent diffusion	No presence of surfactant traces in microsponges	Requires vigorous washing to remove the traces of organic solvents
Lyophilization	Easy quick reproducible results	May lead to cracking or shrinkage of microparticle
VOAG method	Results in microsponges can be used for targeted drug delivery	Requires reflux conditions
Ultrasound-assisted production	No traces of solvents. Quick and reproducible results	Irregular structure.
Electrohydrodynamic atomization method	Quick reproducible and results	Require cross-linking agents that may be potentially toxic. May lead to the binding of drug molecule to the monomer. Control of size of particle and pores requires expertise.

Microsponges can release the given amount of drug over a period of time. The release is influenced by physicochemical factors like pressure, temperature change and solubility etc.

They are described as follows:

Temperature change

At certain temperature, few entrapped active ingredients become viscous and suddenly get released from microsponges. Increase in temperature of specific region also increases the flow rate and release (Of et al., 2015).

Pressure

When pressure is applied microsponges release the active ingredients at the targeted region (Of et al., 2015).

Solubility

Microsponges are filled with water soluble excipients and they release the drug with water. The release of drug that can be activated by diffusion technique.

pH

pH dependent drug release can be achieved by modifying the coating on the microsponge.

Evaluation of microsponge

Particle size determination

Particle size determination of loaded microsponges can be calculated by optical microscopy. In this sample that can be placed on the slide and mechanical stage. In that mean particle size is calculated by measuring more than 300 particles. For cumulative % drug release of microsponges will be determined by plotting particle size versus time. In the final topical formulation, particles of sizes between 1nm and 25µm are required to be used.

Determination of Production yield and Loading efficiency.

Loading efficiency it can be measured by following equation:

Loading efficiency = Drug Content in Microsponge x 100

Production yield of microsponges can be calculated by the gravimetric method using following equation

Production yield =MMicro/MRM

In that,

Mmicro = Weight of formulated Microsponges.

MRM = Weigh of raw materials (Polymer and active ingredient)

All results can be calculated in the triplicates.

DIRECTOR
Yashoda Technical Campus
Satara

Characterization of pore structure

In this case, the volume of pore and diameter are very important in controlling the strength and duration of the effect of the drug. Pore diameter also affects the release of drug from the microsponge system through the vehicle in which all ingredients are distributed. By using mercury intrusion porosimetry the pore size of microsponges, percent porosity, the surface area of pore, percent porosity filled, pore diameters, shape and morphology of the pores, void volume, bulk, and apparent density can be determined.

In-vitro release studies

It is done by using dissolution test apparatus USP XXIII with a modified basket having 5μm mesh size. The dissolution rate can be measured at 37°C and 150 rpm. The dissolution media are chosen in order to maintain sink conditions and solubility of active ingredients. Sample aliquots are withdrawn from the dissolution medium and analyzed by a suitable analytical method (UV spectrophotometer) at regular intervals of tim (Naga et al., 2019).

Polymer/ Monomer composition

Various parameters such as spheres size, polymer composition, and drug loading govern the drug release from microspheres. The composition of polymer can also influence the partition coefficient of the trapped active ingredient between the microsponge system and the vehicle, thereby directly affecting the release rate of trapped substance. Drug release of microsponges of the different polymer compositions can be studied by the plotting the graph in-between average % drug release versus time. Polymers exhibiting varying degrees of hydrophobicity or lipophilicity or electrical charges may be prepared to impart flexibility to the release of active ingredients. A variety of probable excipient combinations can be screened for their compatibility with drugs by studying their drug release profile (Barkaiet al., 1990).

Compatibility studies

Infra-red spectroscopy (IR) and thin-layer chromatography (TLC) is conducted to determine the compatibility of drug and excipient. Powder X-ray diffraction (XRD) and Differential scanning calorimetry (DSC) can determine the effect of polymerization or crystallanity of active ingredients. For DSC, approximately 5mg samples are weighed, sealed and heated at 15°C/min in nitrogen atmosphere (Shaha et al., 2010).

Resiliency

Viscoelastic properties (resiliency) of the microsponge system can be tailored to create beadlets which are soft, ion accordance with the requirements of the final formulation. It increases cross-linking and slows down the release rate. Therefore, tests for viscoelastic properties of microsponges are performed and optimized according to prerequisite, considering release a feature of time of interconnection (Shaha et al., 2010).

Physicochemical characterization of microsponges

Scanning electron microscopy

For morphology and surface characteristics, The sample is coated in the gold-palladium at room temperature under an argon atmosphere, and the microsponge surface characteristics can be analysed by scanning electron microscopy(SEM).

Fourier transform infrared spectroscopy (FTIR)

Fourier transform infrared spectroscopy (FTIR) is performed for the pure drug, polymer and the drug-polymer physical mixture and microsponge formulations. The samples are incorporated in potassium bromide discs and are evaluated using the FTIR spectrometer. The peaks corresponding to the characteristic bands of the drug must be preserved in the spectra of the microsponges to indicate that no chemical interaction or changes have occurred during the preparation of the formulations.

Powder X-ray diffraction (XRD)

Powder X-ray diffraction (XRD) can be performed for both pure drug, polymer and microsponge formulation to investigate the effect of polymerization on the crystallinity of the drug. The disappearance of the characteristic peaks of the drug in the formulation could indicate that the drug is dispersed at a molecular level in the polymer matrix (Kilmer et al., 2010).

Safety Considerations

- Allergenicity in guinea pigs.
- Eye irritation study performed in rabbits
- Mutagenicity in bacteria
- Oral toxicity study in rats.
- Skin irritation studies in rabbits (Kiliçarslanet al., 2003; Sato et al., 1988).

Limitations

The use of organic solvents poses threats like toxicity and flammability. Traces of residual monomers in the bottom-up approach can be toxic and dangerous to health. But these shortcomings can be overcome by proper quality control measures along with optimization and standardization of procedures e. g, post-manufacture washing (Mandava et al., 2012; Srivastavaet al., 2012).

Applications of microsponges

TECHNICAL 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

This system can be used to increase the effect, safety, and quality of prescription as well as over the counter products. Microsponge drug delivery system can be used in various applications. Microsponges drug delivery is mainly applicable to oral and topical applications. Several patents have been reported using different types excipients due to which microsponges exhibit high loading capacity and sustained release ability. These studies offer the formulator a scope to formulate a wide variety of products. Over the counter (OTC) products that contain microsponge drug delivery system and various sunscreens, specialized rejuvenated products, and moisturizers (Kilmeret al., 2010). Some more application of microsponges give (Table 2). Some examples of microsponge drug delivery with their formulations and uses (Table 3).

Marketed formulations

Microsponges Drug delivery System is ideal for skin and personal care and cosmetic products. They can take up the excess of skin oil while retaining an elegant feel on the surface of the skin. This technology is presently employed in a considerable number of products sold by leading cosmetic and toiletry companies worldwide. These products include oil control lotions, moisturizers, conditioners, deodorants, lipsticks, skin cleansers, powders, makeup and eye shadows which offer various advantages. They are advantageous due to increased chemical and physical stability besides they show greater availability which reduces the skin irritation. The controlled release of the active ingredients and unique tactile qualities are other advantages of this system. Some marketed formulation of microsponges with their advantages (Table 4) with some filed patent related to the microsponges (Table 5).

Recent advances in microsponge drug delivery system

Various advances technology have been made by using different methods or techniques e.g. nanosponges, nanoferrosponges, mucoadhesivemicrosponges, and porous microbeads. β-CD nanosponges were also formulated and can be used for hydrophobic as well as hydrophilic drugs. This nanosponge can be developed by cross-linking the β-CD molecule by reacting the β-CD with diphenyl carbonate. Researchers also observed that incorporating cytotoxic substances in a nanosponge carrier system can increase the potency of the drug, these type of

Table 2. Applications of microspongesystem

Active agents	Applications
Anti-inflammatory e.g. hydrocortisone	Prolonged activity with lessened of skin allergic response and dermatoses.
Anti-dandruff e.g. zinc pyrithione, selenium sulfide	Reduced nasty odour with decreases irritation with increase in safety and efficacy.
Skin depigmenting agents e.g. hydroquinone	Improved stability against oxidation with increase in efficacy and aesthetic application.
Anti-fungals	Sustained release of active ingredients
Anti-acne e.g. Benzoyl peroxide	Reduced skin irritation and maintaining efficacy and sensitivity.
Antipruritics	Extended and improved activity.
Sunscreens	These are long lasting products having high efficacy with enhanced protection againstUv rays, and sunburns, sun related injuries at high concentration and with low irritation and sensitivity.

Table 3. Examples of microsponge drug delivery with their formulations

Microsponge Delivery Systems	Drug	Clinical Use
Gels	TerbinafineHCl	Anti-fungal
	Hydroxyzine HCl	Urticaria and atopic dermatitis
	Acyclovir	Viral infections
	Fluconazole	Inflammation
	Benzoyl peroxide	Anti-Acne Treatment
Lotions	Benzoyl peroxide	Anti-Acne Treatment
Creams	Hydroquinone and Retinol	Melanoma
Tablets	Indomethacin	Inflammation
	Paracetamol	Anti-pyretic
	Chlorpheniramine maleate	Hay Fever
	Ketoprofen	Musculoskeletal pain
	Paracetamol	Colon targeting
Implants	Poly (DL-lactic-co-glycolic acid)	Skin tissue engineering
Grafts	Poly (lactic-co glycolic acid)	Cardiovascular surgery
Injection	Basic fibroblast growth facto	Growth factor

Table 4. Marketed formulations of microsponges

Product name	Manufacturer	Advantages
Carac Cream	Dermik Laboratories, Inc. Berwyn , PA 19312 USA	Carac Cream contains 0.5% fluorouracil; it includes 0.35% incorporated in a porous microsphere consisted of methyl methacrylate / glycol dimethacrylate cross-polymer and dimethicone. Carac is a once-a-day topical application . For the treatment of actinic keratosis caused by over- exposure to the sun.
Retin-A-Micro	Ortho-McNeil Pharmaceutical, Inc.	Retin-A-Micro contains 0.1% and 0.04% tretinoin entrapped into a porous microsphere consisted of methyl methacrylatedimethacrylate cross-polymer to enable inclusion of the active ingredient, tretinoin, in an aqueous gel. Used for the topical treatment of acne vulgaris.
Salicylic Peel 20 & 30	Biophora	Salicylic acid 20% has been used in to it.Microspongesystem used for stimulat the skin for for faster results. Itimprove pigmentation, fine lines and acne. Salicylic acid passes easily through the pores.
Line Eliminator Dual Retinol Facial Treatment.	Avon	Retinol (Vitamin A) in MicrospongesDrug Delivery Systeem, for wrinkle-fighting action it release by two ways like immediate and timely release of drug. It clearly reduses appearance of lines and wrinkles.
Micro Peel Plus /Acne Peel	Biomedic	It stimulates the cell turnover so the application of salicylic acid in the form of microcrystals,These microcrystals target the specific areas of the skin. It is the chemical peels releases in to the skin of all dead cells while doing no damage to the skin.
Retinol cream, Retinol 15 Night cream	Biomedic, Sothys	Night cream. Microsponge technology it conatains pure retinol, Vitamin A. It diminishment of fine lines and wrinkles,
Lactrex™ Moisturizing Cream	SDR Pharmaceuticals, Inc., Andover , NJ , U.S.A. 07821	Natural humectant is used for soften and help to moisturizing the dryskin, cracked skin. It also contains 12% lactic acid as a neutral ammonium salt, ammonium lactate,water and glycerine.
Oil free matte block spf20	Dermalogica	Oil-free sunscreen protect the skin from damaging UV-rays while controlling the oil production and givesyou a healthy matte finish. That can be formulated with microsponge technology, Oil free matte block absorbs oil and prevents the shine without any powder esidue.
Sportscream RS and XS	Embil Pharmaceutical Co. Ltd.	Topicalprepareation It gives analgesic-anti-inflammatory and counterirritant actives for the management of musculoskeletal conditions.
Oil Control Lotion	Fountain Cosmetics	Microsponges that can absorb the oil from surface of skin, Eliminatethe shine for hours with this feature-weight lotion, formulated with oil-absorbing Microsponge technology. It can be mainly use for the Acne-Prone, oily skin conditions.s

carriers can be used mainly for the targeting the cancerous cells (Hu et al., 2007). Nanosponge, a novel approach constitutes the self- performing carriers having better penetration to the targeted site due to the external magnetic triggers which enforce the carriers to penetrate to the deeper tissues. Thereafter, the removal of magnetic material from the particles is effected leaving a porous system (Cavalli et al., 2006). The improved characteristics of porous microspheres, led to the development of a process to produce the porous microbeads. This method (High internal phase emulsion, HIPE) consisted of the monomer containing continuous oil phase, a cross-linking agent and aqueous internal phase (Çomoğlu et al., 2007). They also observed increased stability of RNA and the relatively effective encapsulation process of siRNA. This approach may lead to novel therapeutic routes for siRNA delivery (Lee et al., 2012).

Future prospects

Microsponge drug delivery system holds a promising opportunity in various pharmaceutical applications and industry in the coming future as it has unique properties like enhanced the product performance and elegancy, extended the release of active moieties, improved drug release

profile, reduced irritation, improved physical, chemical, and thermal stability which makes it flexible to develop novel formulations. The real challenge in the future is the development of the delivery system for oral peptide delivery by changing ratios of polymers. The use of bioerodible and biodegradable polymers for drug delivery enables it for the safe delivery of the active material. These porous systems have also been studied for drug delivery through a pulmonary route, which shows that these systems can show effective drug release even in the scarce of the dissolution fluid. Therefore, colon is an effective site for targetted drug release. Development of carrriers for alternative drug administration routes like parenteral and pulmonary route is necsessary. These particles can also be used as cell culture media and thus can also be employed for stem cell culture and cellular regeneration in the body. These carrier systems have also found their application in cosmetics due to their elegance,. These developments enabled researchers to utilize them for various purposes. These novelties in the formulation also a new way for drug delivery (Srivastava et al., 2012)

Conclusion

With the demand for innovative and highly efficient Pharmaceutical as well as Cosmetic products, the market holds considerable potential for Microsponge technology and the versatility they offer. Since the researchers have found the new and creative way to deliver actives moieties, they can realize that the full capability of these materials providing safety and stability. It also reduces side effects of the active moieties, enhances multi-functionality and also increases active ingredient compatibility with the excipients. Microsponge delivery system would be a winning and innovative strategy for future, in the Pharmaceutical and Cosmetic industry. Microsponges have a distinct advantage over the conventional topical dosage forms for the treatment of topical diseases; it is a new strategy or one of a kind of technology for the controlled release of agents. It is advantageous over other products by because it is non-mutagenic, non-toxic & non-irritant. Thus the microsponge drug delivery system has got a lot of potential and is an emerging field which is essential to be explored for research in future.

Review Article

A Review on Medicinal Plants of Natural Origin for Treatment of Polycystic Ovarian Syndrome (PCOS)

Shivani Andhalkar *[1], Vitthal Chaware [2], Vivek Redasani [3]

[1]Department of Pharmacology, YSPM's Yashoda Technical Campus Wadhe, Satara, India.
[2]Head of Department (Pharmacology), YSPM's Yashoda Technical Campus, Wadhe, Satara, India.
[3]Principal, YSPM's Yashoda Technical Campus, Wadhe, Satara, India.

A B S T R A C T

Polycystic ovarian syndrome (PCOS) related infertility is a global problem that is spreading at an alarming rate. Chronic anovulation, polycystic ovaries, and hyperandrogenism, as well as abnormal menstrual cycles, hirsutism, acne, and infertility, are all symptoms of this condition. PCOS is linked to insulin resistance and elevated levels of male hormones (androgens). Among other things, an inactive lifestyle, a lack of exercise, dietary changes, and stress are all contributing factors. Curcuma longa, Aloe barbadensis**,** Mentha piperita, Allium fistulosum Cinnamonum zeylanicum, and other plants have been shown to be effective in the treatment of PCOS. The aim of this review is to summarise the most effective medicinal plants that are used in the treatment or prevention of PCOS. Special emphasis is placed on the role of insulin resistance and the possible utility of insulin sensitizers in the treatment of PCOS.

Keywords- Polycystic ovarian syndrome (PCOS), Screening methods of pcos, Pathophysiology of pcos.

INTRODUCTION

Leventhal and Stein in 1935 first defined a disorder, which would ultimately become known as polycystic ovary (or ovarian) syndrome (PCOS)[1]. Polycystic ovary syndrome (PCOS), a unitization of symptoms, which affects women of child-bearing age is assumptive in epidemic proportions. A resultant of imbalance in proportion of female sex hormones, results in cysts within antral follicles of ovaries. Once multiple cysts are formed in the ovarian follicles because of the hormonal imbalance, it is characterized as PCOS. Anovulation and absence of menstrual cycle prevents fertilization, and conception in women, thus pregnancy becomes troublesome[2]. PCOS affects 6–10% of women throughout the globe. According to 1990 NIH criteria 7–12 and even more individuals. According to the broader Rotterdam criteria, which makes it one of the most common human disorders and the single most common endocrinopathy in women of reproductive age.[3] The oxidative stress (OS), that will increases in inflammation, which also been reported as possible cause of PCOS[4]. Women with PCOS has several risk factors which are associated with the development of uterine cancer including fatness, hyperinsulinemia, diabetes mellitus and abnormal uterine bleeding.[5] The frequency of depression and anxiety is higher in women with PCOS than in the general population. Mood disorders are capable of impairing quality of life, which are well-known in young adult women, concerned with fertility, and in women of all ages with respect to obesity, and clinical manifestations of excessive androgen.[8]

RISK FACTORS[6]

- Obesity
- Family history of Infertility
- Family history of PCOS
- Family history of diabetes
- Fast food diet habits
- Lack of physical exercise

PATHOPHYSIOLOGY OF PCOS[7]

DIRECTOR
Yashoda Technical Campus
Satara

The pituitary gonadotropin is fundamental to reproductive function-its production and secretion of FSH and LH is directly stimulated by hypothalamic GnRH and it is also influenced by integrated feedback mechanisms. The initial stimulus for follicular development and also granulosa cell conversion of androgens to oestrogens by stimulating the aromatase enzymes is provided by FSH. Luteinizing Hormone(LH) characteristically known for its role in the luteal phase by promoting secretion of progesterone, also it has a vital role in the follicular phase, for inducing thecal androgen production. Women with PCOS often secrete more LH and this might result in higher theca cell androgen secretion. to maintain gonadotropin secretion pulsatile GnRH stimulation is required, but the continuous exposure of the pituitary to GnRH causes desensitisation and a suppression of gonadotropin secretion. Due to Changes in the pulsatility of GnRH alter the ratio of secretion of the two pituitary gonadotropins throughout the menstrual cycle.[7]Excessive androgen in PCOS is related with increase in abdominal fat leads to dyslipidemia and hyperinsulinemia. Thus, hyperinsulinemia reduces hepatic sex hormone-binding globulin(SHBG) to increase circulating bioactive testosterone levels.[8]

Screening Methods of PCOS

Androgen Induced PCOS Model[9]:

Hyperandrogenism is the most common symptom of PCOS. One of the etiologic hypotheses for PCOS is that early life exposure to excessive androgens leads to PCOS later in life. Increased levels of circulating androgens in the rodent affected ovarian follicular maturation and cyst development, according to a study published more than 30 years ago. Several androgens, including dehydroepiandrosterone (DHEA), testosterone propionate (TP), and 5a-dihydrotestoterone, have been used to induce an acute PCOS condition in rats through regular injection or subcutaneous implants (DHT). However, there is still some inconsistency in the reporting of endocrine hormones and ovarian histology in different models. Furthermore, some studies did not look at cardiometabolic parameters or the effects of daily androgen injections and/or treatment on physiologic indices like body weight, stress indicators, or food intake. The pathological induction of PCOS in these rodent models is transient and dependent on androgen treatment. As a result, natural reproductive/ovarian cycling happens again after androgen administration is stopped.

DHEA Induced PCOS[9]:

The first androgen to increase in the female peripubertal cycle is dehydroepiandrosterone. Nearly half of follicular synthesised T can be obtained from circulating DHEA, and 25% of PCOS patients have higher-than-normal circulating DHEA levels. Roy et al. were the first to use dehydroepiandrosterone to induce PCOS in rats. DHEA (6 mg/100 g body weight, dissolved in 0.2 mL sesame oil) is injected daily for up to 20–27 days into prepubertal rats, typically aged 22 days. Rats become acyclic and anovulatory after treatment

Ovarian Morphology: Multiple follicular cysts varying in size from 0.45 to 2.2 mm in diameter, as well as degeneration of granulosa cell layers, grow in dehydroepiandrosterone-induced rats. The ovarian tunica capsule is not thickened, and the ovarian weight of DHEA-treated rats is substantially increased.

***Endocrine hormone profile*:** DHEA-induced rats have significantly higher serum DHEA, T, E2, FSH, LH, and PRL concentrations than control rats, while no changes in plasma FSH and LH concentrations have been identified by other groups. Fasting serum glucose and insulin concentrations were higher in DHEA-induced rats, indicating cardiometabolic abnormalities.

Early DHEA-related hyperandrogenemia, anovulation, cystic ovaries, and the production of insulin glucose metabolism abnormalities can all be detected using the DHEA-induced model.

TP- *Summary*: Induced PCOS Model[10]:

Testosterone propionate (TP) can cause hyperandrogenemia in rats when given prenatally or postnatally. Furthermore, prenatal T exposure during the crucial time of foetal development has been linked to reproductive system developmental and morphological abnormalities. Pregnant rats were given a single dose injection of T on gestational day 20 or T propionate (TP) from days 16 to 19 (3 mg T daily) of pregnancy for prenatal administration. Rats were given TP at a dose of 1.25 mg/100 g body weight at 5 days of age, or daily injections of 1 mg/100 g body weight from 21 to 56 days of age.

Estrous cyclicity: T prenatally treated rats had longer and more irregular estrous periods. Estrous cyclicity was disrupted and diestrus phase was persistent in postnatally treated rats.

Ovarian morphology: In the ovaries of rats treated prenatally with T, the number of preantral and antral follicles increased, whereas the number of pre-ovulatory follicles and corpus luteum (CL) cells decreased, as opposed to control rats. In prenatal T-treated rats, cystic follicles were also discovered. Rats given T postnatally, on the other hand, had massive cystic or atretic follicles and luteinization of theca cells in the ovaries. When postnatal T treated rats were fed a high fat diet, their body weight increased while their fasting glucose levels remained unchanged.

Summary: The ovary of rats treated with postnatal T showed morphological changes that mirrored the human PCOS phenotype. Prenatal T therapy, on the other hand, increased the number of preantral and antral follicles in rats, despite the fact that cystic follicles and ovary weight were unchanged in this model, and the reported changes did not match the ovarian morphology of people with PCOS. Both prenatal and postnatal T therapy increased serum T levels. Prenatal T administration had no effect on serum E2 and P4 levels, while continuous postnatal T treatment increased E2 levels, likely due to T conversion. An increased number of kisspeptin-positive cells in the ARC of

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

prenatal T-treated ewes may be linked to defects in GnRH/LH secretion feedback control 11; however, one drawback of this study is that LH levels and ovarian morphology were not examined..

DHT induced PCOS models[10]:

Since DHT is not converted to E2 by aromatase, the PCOS phenotype in DHT-treated animals can be studied without taking into account the effects of oestrogen derived from androgens.

Prenatal DHT treated models:

Mice were injected with 250 g of DHT on days 16, 17, and 18 of gestation 28 to generate prenatal DHT-treated animals, while rats were given 3 mg of DHT daily from gestational day 16 to 19. The offspring were used as PCOS models that had been prenatally treated with DHT.

Estrous cyclicity: Prenatally administered DHT caused irregular cycles in rats and mice. The mice spent more days in diestrus and fewer days in proestrus than controls, resulting in fewer litters being produced every three months.

Ovarian morphology: Prenatal DHT treatment resulted in fewer normal large, antral, preovulatory follicles and CLs, as well as more atretic cyst like follicles. In prenatal DHT treated mice, CL and antral follicle wall areas were reduced, but the number of atretic cyst like follicles and the thickness of the antral follicle theca cell layer increased.

Neuropeptides in the hypothalamus: The number of kisspeptin and NKB positive cells in the ARC of the hypothalamus increased significantly in prenatal DHT treated rats, whereas the number of kisspeptin positive cells in the AVPV did not differ from that of control animals in diestrus. The input of aminobutyric acid (GABA) to GnRH-expressing neurons was increased in mice given DHT prenatally, according to a recent study.

Metabolic features and adiposity: Prenatal DHT-treated rats and mice had body weights that were close to control animals. Prenatal DHT therapy, on the other hand, increased adipocyte region in parametrial fat and the degree compared to the control group.

DHT prenatally treated rats and mice had abnormal estrous cycles and ovarian morphology similar to PCO. In prenatal ***Summary:*** DHT-treated rodents, increased LH levels were observed, along with an up regulation of kisspeptin in the ARC. There was no discernible difference in body weight, on the other side. This phenotype is similar to PCOS, which is marked by normal body weight and increased LH secretion.

Letrozole-Induced (Aromatase Inhibitor) Rodent Model of PCOS[11] :

Abnormal follicular development and polycystic ovary may result from intraovarian androgen excess caused by circulating hyperandrogenemia or abnormal steroidogenesis. P450 aromatase, which was expressed in the placenta, ovary, and testis as well as a wide variety of human tissues, converted testosterone and androstenedione into estradiol and estrone, respectively; a decrease in the enzyme's activity could result in increased ovarian androgen production and the development of PCOS. Aromatase is the key enzyme that converts T and androstenedione into E2 and estrone, respectively. It is widely expressed in human tissues, such as placenta, ovary, and testis. Reduced aromatase activity in the ovary is one of the pathophysiologic hypotheses of PCOS development. Letrozole is a nonsteroidal aromatase inhibitor that reduces conversion of androgens to estrogens in the ovary, resulting in increased T and decreased E2 production. Excess T in the ovaries is likely to cause polycystic ovaries directly in Letrozole-treated rats. The reduction in estrogen weakens the negative feedback on LH production in the pituitary, resulting in increased LH levels, which further stimulates theca cells to secrete T. Typically, 6-week-old female rats (puberty) are administered Letrozole orally at doses of 0.1, 0.5, and 1.0 mg/kg daily for 21 days, after which they become acyclic, with histological and biochemical features of human PCOS.

Estrous cyclicity: Regular vaginal smear examinations were used to monitor estrus cycles. In the analysis, only animals with two consecutive standard 4-day periods were used. The rats and mice treated with letrozole were fully acyclic. This rat model's vaginal smears showed an excess of leukocytes, the diestrus phase's predominant cell type.

Ovarian morphology: Ovaries from control group exhibited follicles in various stages of development including secondary follicles, graffian follicles, and fresh corpora lutea. In study groups, letrozole inhibited growth of follicles in a dose-dependent manner. Small follicles could be observed in early development, in addition to follicles showing evidence of atresia, and many large cysts with virtually no granulosa cell layer or large cystic follicles with scant granulosa cells. Ovaries from the sample groups had a higher rate of subcapsular ovarian cysts and capsular thickening than the control group. together with incomplete luteinization and a dose-dependent decrease in the amount of corpora lutea In some of the research classes, there was also evidence of theca cell hyperplasia..

Summary: Acyclicity, cystic ovarian morphology, elevated serum LH levels, and higher Kiss1 mRNA expression in the posterior hypothalamus are all observed in letrozole-induced PCOS model rats compared to control rats. This model accurately reproduces the metabolic characteristics of human PCOS, including a PCO-like morphology and elevated serum LH levels, and is thus suitable for studying human PCOS. Increased KNDy neuron activity was linked to a reduction in the negative feedback effect of sex steroid hormones, as evidenced by increased Kiss1 mRNA and serum LH levels.

Medicinal plants of natural origin-

Curcuma Longa (Turmeric) ***[12]:***Curcumin is a water-insoluble polyphenolic curcuminoid derivative found in the rhizomes of Curcuma longa, an Indian spice (turmeric). Turmeric is widely used in Asian cuisine as a food additive

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

and colouring agent, as well as in Indian herbal medicine. Curcumin makes up around 2–8% of all turmeric preparations. Curcumin has been shown to have a wide range of biological effects like Anti-inflammatory, antioxidant, hypoglycaemic, and antihyperlipidemic properties The study used virgin, cyclic, adult female Wistar Albino rats weighing 160–200 g. Once everyday for 21 days, followed by treatment with curcumin. Letrozole treatment resulted in abnormalities in the serum sex steroid profile, lipid profile, glucose, and glycosylated haemoglobin levels and antioxidant activity has been depleted. Whereas Curcumin was able to exert its calming effect by returning all parameters to normal and causing cysts in the ovaries to vanish. Curcumin, like Clomiphene citrate, has a number of beneficial effects in the treatment of PCOS.

Aloe barbadensis (Aloe)[13]:Aloe barbadensis Mill. (Liliaceae) is a well-known plant with such properties. Polyphenols, sterols, flavanoids, and other nutrients were analysed qualitatively and quantitatively for polyphenols, sterols, flavanoids, and other nutrients in the Aloe vera gel formulation. To induce PCOS, five-month-old Charles Foster female rats were orally fed letrozole, a non-steroidal aromatase inhibitor. The rats were then given the Aloe vera gel formulation orally.AVG treatment of PCO rats resulted in a reduction in ovary atretic cysts as compared to PCOS controls, according to histological review. By restoring ovarian steroid status and modifying main steroidogenic behaviour, aloe vera gel formulation protects against the PCOS phenotype.

Glycyrrhiza glabra (liquorice)[14]: Traditional medicine has used liquorice (Glycyrrhiza glabra of the Leguminosae family) to treat a variety of ailments. Antifungal, antiviral, antibacterial, and antihyperglycemic properties are all present in it. The most bioactive compound in liquorice is glycyrrhizic acid. Phytoestrogens found in liquorice include liquiritigenin, liquiritin, isoliquiritin, isoliquiritigenin, glabidin, and glabrene. The effects of two natural compounds derived from liquorice root on vascular tissues in vitro and in vivo were reported: glabridin, the main glabrene, and isoflavane, an isoflavene, both demonstrated estrogen-like activities. One of the bioactive compounds responsible for weight loss may be liquiritigenin, a selective oestrogen receptor ligand. Some molecules, such as glabrene and glabridin, have been shown to reduce weight in vivo. It has also been documented that treating hirsute women with a combination of spironolactone and liquorice may help with PCOS by reducing the volume depletion caused by spiranolactone and possibly increasing its anti-androgenic activity.

Mentha piperita(Peppermint) [15]:Peppermint (Mentha piperita L.) is a member of the Labiatae family that originated in the Mediterranean region and is now widely cultivated all over the world. Antioxidant, antitumor, antiallergenic, anti-inflammatory, antiviral, antibacterial, and antifungal properties are all present in peppermint. It also has anti-androgenic properties, lowering the level of free testosterone in the blood after three weeks of treatment with letrozole and peppermint. Females with PCOS had significant changes in serum testosterone, oestrogen, LH, and FSH function. Ovarian cysts with a reduced granulosa layer, atretic follicles, and a small number of corpora lutea were found in the PCOS community. Peppermint was found to have a strong potential as an alternative therapy in the treatment of PCOS, as shown by necrosis in stromal mesenchymal cells, hyperplasia of luminal epithelial cells, and necrosis in stromal mesenchymal cells.

Allium fistulosum (Onion)[16]: In Asian countries, the Welsh onion (Allium fistulosum) is well-known for its use in food and traditional medicine. For treatment, administered AF extract to letrozole-treated rats for 2 weeks. In terms of serum hormonal levels, the LH/FSH ratio and serum oestrogen levels were positively affected by AF extract therapy. FSH and LH are necessary for ovulation, and PCOS patients often have a two- to three-fold increased LH/FSH ratio, which is enough to cause ovulation disruption. The findings suggest that AF extract normalises follicular growth and ovarian cysts. In the letrozole-induced PCOS rat model, the steroid hormone-related receptors demonstrated restoration of m-RNA expression after treatment with AF extract A. fistulosum extract treatment relieved hormonal imbalance and altered ovarian function.

Linum usittassimum (Flaxseed)[17]: Flaxseed is made from Linum usittassimum (Linaceae), an omega-3 fatty acid-rich food that is also one of the best sources of dietary lignin. ALA, lignans (secoisolariciresinol diglycoside-SDG), and soluble flaxseed fibre mucilage (d-Xylose, L-Galactose, L-Rhamnose, d-galacturonic acid) are all biologically active compounds with major health benefits. Flaxseed or isolated lignan has been shown in studies to lower androgen levels while also normalising lipid levels. Lignans seem to minimise excess testosterone, which is a crucial factor in the development of PCOS. Flaxseed supplementation can help women with PCOS control androgen levels, according to a case study. The study found a substantial reduction in androgen levels. There was also a decrease in hirsutism. Flaxseed can have a significant effect on testosterone levels, as well as symptoms associated with hyperandrogenism, such as hirsutism, according to the findings. Another research looked at the impact of flax seeds on ovarian morphology in PCOS patients, finding that flax seed supplementation decreased ovarian volume, increased the amount of follicles in the ovaries, and improved menstrual cycle duration. However, hirsutism, blood sugar levels, or body weight did not improve as a result of the research.

Panax ginseng (Ginseng)[18]: Herbal medication is made from the roots of Panax ginseng (Araliaceae). It has anti-aging properties and is used as a tonic. Ginseng saponins are ginseng's active ingredient. Rb1, Rb2, Rc, Rd, Re, Ro, Ra, and minor ginsenosides make up these ginsenosides. It can be used as a dietary supplement. Estradiol valerate induced polycystic ovary in rats. The ovarian morphology was examined in this analysis. The ginseng-containing formulation is known as Kampo preparations**.** It is formulation significantly decreases the plasma LH levels

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

and thereby it is effective in improving endocrine condition in the treatment of disturbances of ovulation in patients with PCOS.

Tribulus terrestris (Puncture vine)[19]: Puncture vine or Devil's eyelashes, Tribulus terrestris (Zygophyllaceae), plays an important role in traditional medicine. The herb Tribulus terrestris has been shown to help with polycystic ovarian syndrome. Tribulus terrestris extract was found to be successful in improving ovulation in rats with polycystic ovaries induced with estradiol valerate in a study. The extract treatment improved ovarian follicular development and normalised estrous cyclicity and steroidal hormone levels. Many herbalists believe that tribulus is an excellent overall ovarian stimulant and female fertility tonic for women with polycystic ovary syndrome.

Gymnema sylvestre (Gymnema)[20]: Gymnema sylvestre (Asclepiadaceae) is an Ayurvedic herb that has been used for thousands of years. It has a wide range of pharmacological effects, including anti-diabetic, hypoglycemic, and lipid-lowering properties. Saponins, especially gymnemic acids, are the active constituents in gymnema. Gymnema has been shown to have hypoglycemic properties in diabetic animal models. It keeps blood glucose levels in check. Metformin therapy is a convenient way to treat PCOS. Gymnema can thus be used to treat the root cause of insulin resistance. Gymnema is a good choice for PCOS because of its insulin-modulating properties and the added advantage of lowering the high triglycerides that come with the condition.

Punica granatum (Pomegranate)[21]: Pomegranate (Punica granatum of the Punicaceae family) is a fruit with a wide range of medicinal properties. Folic acid, vitamins (B2, C, B1), carbohydrates, pantothenic acid, and organic acids are all contained in the fruit. Unsaturated and saturated fatty acids are said to be present in the crop. In adult female rats, the effect of pomegranate extract in the control or management of PCOS was studied using a control and a PCOS community. The levels of free testosterone, serum oestrogen, and andrestandoin hormone were measured in the experimental community. Pomegranate extract seems to have a protective impact on polycystic ovarian syndrome hormonal imbalances, according to the report. The extract's phenolic compounds and phytosterols have been shown to help alleviate PCOS complications. Consumption of the extract, according to the report, decreases the complications associated with PCOS.

Symplocos racemosa (Lodh Tree)[22]: Symplocos racemosa Roxb, a member of the Symplocaceae family, is a common Ayurvedic remedy for female problems. It's also known as Lodhra, and it's used as a single medication or in multi-component formulations and preparations in Indian medicine. In a Letrozole-induced female rat model, the anti-androgenic properties of S. racemosa were investigated in the treatment of PCOS. Treatment with Symplocos racemosa resulted in substantial improvements in oestrogen, testosterone, progesterone, and ovarian tissue levels. It improves fertility and prevents ovarian cell dysfunction in PCOS patients.

Cinnamomum zeylanicum (Cinnamon)[23]: Cinnamon (Cinnamomum zeylanicum of the Lauraceae family) is an insulin potentiator. Insulin-stimulated glucose uptake and glycogen synthesis are controlled by this compound. Fasting and oral glucose tolerance test values were assessed in fifteen women with PCOS in a pilot study. In women with PCOS, the cinnamon extract increased insulin sensitivity. Cinnamon extract contains polyphenols and procyanidins, which potentiate the insulin signalling pathway, resulting in a hypoglycemic impact. Cinnamon's function as an adjunctive therapy in the treatment of PCOS was identified in this research. Cinnamon's impact on menstrual cyclicity and metabolic dysfunction in women with PCOS was studied in another research. It was a 45-woman randomised controlled trial. Oral cinnamon supplements were given. Menstrual cyclicity, luteal phase, and progesterone levels were all tracked. Cinnamon supplementation increased menstrual cyclicity and was shown to be beneficial in the treatment of polycystic ovary syndrome.

Vitex Negundo(Chaste Tree)[24]:Vitex negundo is a plant belonging to the (Linn) Verbenaceae family, genus Vitex, and species negundo. It's the five-leaved chaste flower, also known as monk's pepper. It has been documented to have anti-inflammatory, analgesic, antioxidant, antifungal, antiviral, and anti-inflammatory properties, as well as being used in gynaecological disorders. It also has anti-androgenic and estrogenic properties (linoleic acid-like estrogenic compounds). For the induction of PCOS, letrozole was given orally (p.o) for a duration of 21 days. The rats were then given extract of vitex negundo, which has positive effects on the ovary as well as effects on glucose tolerance, estrous cycle irregularities, LH: FSH ratio, steroidogenic enzymes, and cardiovascular parameters. It was able to successfully treat the rats with extract, which caused abnormalities in serum sex steroid profile, lipid profile, glucose, and estrous cycle. This may be attributed to the extract's phyto-components.

CONCLUSION:

The most common cause of menstrual irregularities and hyperandrogenism is polycystic ovary syndrome (PCOS). It is the most common cause of female infertility. Several risk factors for PCOS have been studied, including glucose intolerances, obesity, and dyslipidemia. Many treatments are currently available, but they are associated with moderate to serious side effects, and their high cost has led to a search for plant-based remedies to treat PCOS. In this study, summarize some of the most important medicinal plants for treating PCOS and helps with PCOD symptom relief and management. Hyperandrogenism, insulin sensitivity, fertility, and menstrual cyclicity are all aided by these plants.

ACKNOWLEDGEMENT: The authors are thankful to Management of YSPM's Yashoda Technical Campus, Wadhe, Satara (Mah.) for the valuable support and providing facilities to carry out this review work.

ABSTRACT:

In current situation lots of Molecular Docking Software are available in the market for *Insilico* study of pharmaceutical drug molecules, so that we have to choose most appropriate software. During literature survey it was found that AUTODOCK software was efficiently guided to as author's regarding mainly pharmacological activities such as Antidiabetic activity, Antimalarial activity, Antivirus activity, Anticancer activity, Anti mycobacterial tuberculosis activity, Antioxidant activity, Etc. After review it was analyse that the AUTODOCK and its Tools are more efficient to determine the synthesis techniques, spectral analysis, docking simulation, photochemical activities, therapeutic effects, toxicological studies.

KEYWORDS: Molecular docking, Drug discovery, Auto dock software.

INTRODUCTION:

In the field of molecular modeling, docking is a method which predicts the preferred orientation of one molecule to a second when bound to each other to form a stable complex. Knowledge of the preferred orientation in turn may be used to predict the strength of association or binding affinity between two molecules using, for example, scoring functionsThe associations between biologically relevant molecules such as proteins, peptides, nucleic acids, carbohydrates, and lipids play a central role in signal transduction. Furthermore, the relative orientation of the two interacting partners may affect the type of signal produced (e.g., agonism vs antagonism). Therefore, docking is useful for predicting both the strength and type of signal produced.

Molecular docking is one of the most frequently used methods in structure-based drug design, due to its ability to predict the binding-conformation of small molecule ligands to the appropriate target binding site. Characterisation of the binding behaviour plays an important role in rational design of drugs as well as to elucidate fundamental biochemical processes [1-3].

REVIEW OF LITERATURE:

Sukanta Kumar Pradhanand et al used the Autodock 4 softwear for conducting several studies and identifing several target sites which influence drug-resistant to M. tb strains. In this case, there is the interaction between the protein Arabinosyl transferase C and two existing drugs (Ethambutol and Isoniazid) and by calculating the binding affinity and mode of binding. Ethambutol formed the five modified molecules (Emb 1, Emb 2, Emb 3, Emb 4 and Emb 5). The Emb 1 and Emb 3 having binding affinity- 5.77Kcal/mol and -5.13Kcal/mol respectively that are potential inhibitors of Arabinosyl trasferase C in mycobacterium tuberculosis [4].

Mohammed Al bratty used the Autodock Vina softwear for studying the extent and types of binding interaction present in between HAS and Anti Hypertensive drug like telmisartan (TLM). HAS is responsible for binding and transportation of many exogeneous and endogeneous ligand including drug like telmisartan in binding interaction, the TLM significantly interacts with binding site-1 of HAS by forming strong Hydrogen with Glu292 and Lys195 residues that affects concentration of TLM at site of action and also affects on therapeutic effect [5].

Idhayadhulla Akabar and et al used Auto Dock Vina softwear for the molecular interaction study between target protein and ligands. This study more exposed the all inhibitor acquired the negative dock energy against

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

the target protein. In molecular docking investigation it was found that the natural coumarin analogue toddacoumaquinone shows the inhibitory activity with binding energy -7.8Kcal than other compound against main protease of SAR coronavirusin intricate with a-ketomide [6].

Ran Yu and et al used the AutoDockVina softwear in the current spread of noval coronavirus (SAR-CoV-2) situation to discover the Anti Viral drug. This softwear helps to screening the potential drug by molecular docking with structural protein and non-structuralprotein site of new coronavirus. The Ribavirin, remdesivir, chloroquine and luteolin are also studied, the luteoline is bind with high affinity to same site of the main protease of SARS – CoV-2 [7].

Fareeda Athar and et al used the AutoDock. 4.2. for molecular docking studies performed that all derivatives along with the standard inhibitor STX-0119 showed that binding energy released in direct binding with the SH2 domain of STAT3 was the highest for compound 5e (-9.91kcal/mol). In virtual screening, compound 5e was found to exhibit optimum competency in inhibiting STAT3 activity. Compound 5e decreased the activation of STAT3 as observed with Western blot. The compound 5e was identified as a potent antioxidant agent and STAT3 inhibitor and effective agent for cancer treatment [8].

Akinwunmi O. Adeoye and et al used AutoDock softer for Molecular docking and virtual screening to understand the mechanism of ligand binding and to identify potent calcium transporter inhibitors: This study also deals with the evaluation of inhibitory activity of secondary metabolites of ethylacetate partitioned-fraction of Adansoniadigitata stem bark extract on malaria-associated protein using in silico docking studies. Digitata stem bark extract were examined for their antiplasmodial activity. Digitata shows the binding energy ranging between -6.5kcal/mol and -7.1kcal/mol. Among the two chemical constituents, apigenin has the highest docking score along with the highest number of hydrogen bonds formed when compared to quercetin. The analysis results suggest that apigenin and quercetinare acts as an anti-malaria agent [9].

Mohammad Jakir Hosen and et al used the AutoDock Vina softwear for the screening of the drugs against RdRp of SARS-CoV-2. It has been found that RNA dependent RNA polymerase (RdRp) plays a crucial role in SARS-CoV-2 replication, and thus could be a potential drug target. This study revealed that Rifabutin, Rifapentine, Fidaxomicin, 7-methyl-guanosine-5′-triphosphate-5′-guanosine and Ivermectin have a potential inhibitory interaction with RdRp of SARS-CoV-2 and could be effective drugs for COVID-19 [10].

PrashamsaKoirala, Su HuiSeongand et al used the AutoDock 4.2 softwear for determined the molecular interaction of BACE1 with isolated terpenoids. The AutoDock 4.2 programme revealed that hydroxyl group of lupeol formed two hydrogen bonds with the ASP32 (catalytic aspartic residue) and SER35 residues of BACE1 with the binding energy of (−8.2kcal/mol), while the ketone group of lupenone did not form any hydrogen bonds with BACE1 giving evidence for less binding affinity. It predicted that the dependence of the inhibitory activity in the presence of hydroxyl group which has provided a new basis for BACE1 blockade [11].

A. Lakshmana Rao and et al used the AutoDock 4.2.6softwear. The docking procedure was applied on a set of designed ligands within the region of 2PRG active site using AutoDock 4.2.6 software. Based on the validations and hydrogen bond interactions of various substituents, they were considered for the evaluation. It was done to understand the kind of interactions that occurred between various substituted thiazolidine-2, 4-diones with 2PRG binding site region [12].

Lakshmana Rao ATMAKUR and et al used AutoDock softwear for In vitro anti-inflammatory activity was checked by human red blood cell (HRBC) membrane stabilization and protein denaturation. Using AutoDock, molecular docking studies were carried out to find out the best fit ligands. In molecular docking studies, compounds 4h and 4n exhibited higher binding affinity at PPARγ receptor protein and compound 4k exhibited higher binding affinity at COX-1 and COX-2 actives sites Compounds 4h and 4n exhibited higher binding affinity at PPARγ receptor protein and compound 4k exhibited higher binding affinity at COX isoenzymes' active sites in molecular docking studies. AutoDock 4.2.6 software was utilized to know the type of interactions of the designed 3D-structured thiazolidinediones with the 2PRG, 1EQG, and 1CX2 active site regions [13].

GanugapatiJayasreeand et al used AutoDock 4.0 for theDocking studies which are essential to understand the interaction between the protein and the ligands. In this case the crucial protein from Insuline receptor and ligands from Cinnamon. Docking studies are essential to understand the interaction between the protein and the ligands. In Autodock studies, the best pose was obtained with least energy value from which it can be hypothesized that these 2 compounds can be considered as potential activators of insulin receptor. After that the lab studies have to be performed to confirm the

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

properties of these 2 compounds. tubulin isotypes. This indicates that select triple-modified 4 –chloro thio colchicines derivatives representhig hlypromising novel cancer chemotherapeutics. All the poses generated by both programs were rescored using the Vina scoring function. The top binding pose of colchicine and the derivatives was predicted by the Vina scoring function for the α-βII. a model which produce the best result sin terms of pIC50 predictions. Active residues involving non-hydrophobic interactions with the ligand are also specified for each compound [14].

Sarfaraz Alamand et al used AutoDockVina software (Scripps Research Chandrajit Dohutia and et al used AutoDock 4.2 to identify the receptor protein PfATP6 was the common target of artemisinin and curcumin. It was initiated to assess the antimalarial activity of six curcumin derivatives based on their binding affinities and correlating the in silico docking outcome with in vitro antimalarial screening. A ligand library of thirty two Knoevenagel condensates of curcumin were designed and docked against PfATP6 protein and six compounds with the best binding scores were synthesized and screened for their antimalarial activity against the sensitive 3D7 strain of Plasmodium falciparum [15].

Adam Huczynski and et al used AutoDock Vina and DOCK 6.5 for In silico studies to predict binding modes of the 4-chloro thiocolchicine derivatives to different β Institute, La Jolla, CA, USA) for molecular docking studies to validate the LibDock score. The designed compounds are optimized and then use for docking experiments. The docking program takes the PDBQT file format of ligands and receptor, a modified PDB file, which has added polar hydrogens and partial charges [16].

Leena K Pappachen and et al used AutoDock version 4.0 screeing program for doking the Benzothiazole derivatives with the crystallographic structures of the targets. AutoDock screening program also used to know about the hydrogen bonding interactions of all the derived compounds. The number of hydrogen bonding will considerably increase the affinity of ligand target interaction. The AutoDock shows that most of the benzothiazole derivatives show higher hydrogen bonding between the ligand-target interactions. The hydrogen bonding interactions increases the binding energy of ligand-protein interactions. The docking scores obtained for benzothiazole derivatives (BT1, BT2, BT3, BT4) and std. tamoxifen from the preliminary docking program using using AutoDock program were −6.29, −5.25, −7.19, −7.48, −3.86, r. All the four derivatives were synthesized, characterized, and subjected to in vitro anticancer screening by MTT assay in breast cancer (MCF-7) cell lines. Compounds DBT1, DBT2, and DBT3 were the most active compounds against MCF-7 cell lines with inhibitory concentration 50% of 70.0, 64.0 and 65.0, respectively. All the four derivatives show good docking scores when compared to standard drug tamoxifen and can be concluded that all the synthesized benzothiazole ligands show good anticancer property [17].

Gurudeeban Selvaraj and et al used AutoDock 4.0 for the docking analyses, There are different bonding modes of one ligand with multiple active cavities of DPP-IV. The docking analyses indicate that the bioactive constituents, β-stigmasterol, barbamide, docosahexaenoic acid, arachidonic acid, and harman shows the best binding energies on DPP-IV receptor and hydrogen bonding with ASP545, GLY741, TYR754, TYR666, ARG125, TYR547, SER630, and LYS554 residues. This result shows that docosahexaenoic acid, arachidonic acid, β-stigmasterol, barbamide, harman, ZINC58564986, ZINC56907325, ZINC69432950, ZINC69431828, ZINC73533041, ZINC84287073, ZINC69849395, and ZINC10508406 act as DPP-IV inhibitors [18].

J. Selvaraj and et al used the AutoDock softwear for validation through structure analysis verification server. For identification, the new potential drugs against GLUT4 protein the molecular docking studies of 20 natural compounds were carried out using AutoDock. The results shows that modeled structure has 87.9% residues at the core region.It was also shows that the good binding interactions of the ligand with both the targets at very low energy level. Based on the docking energy value, H-bond interaction the compounds hesperidin, fisetin, eriodictyol, wogonin, and chrysin was selected as the most potent compounds for GLUT4 protein. Hence, It was conclude that the compound shows the Anti Diabetic activity [19].

Natarajan Kiruthiga and et al used the AutoDock 4.2 for identify the binding modes of titled compounds responsible for the activity on the receptor sites. The compound HFd with 2, 4-dimethoxy group on ring C and 7-hydroxy substitution on ring A showed binding interactions with amino acid residues of alpha amylase as Arg 61, Pro 44, His 299, Gln 41 and Asp 96. Hence the scaffolds were acts as a navigator in the management of diabetic mellitus [20].

Saravanan R.R and et al used the AutoDock program for the docking simulations in the active sites of 2XNU, which shown the successfully reproduce binding modes in terms of lowest docking energy. The target protein structures of 2XNU were docked with MPIPA which shows the excellent results as were seen by the least values of the binding energy with the help of Autodock

Satara

v4.0, In docking studies of the title derivative it understand that the possibility of these compounds to act as effective inhibitors [21].

Humaira Nadeem and et al used the AutoDock Vina softwear forThe interactions between the compounds and active site residues of H^+/K^+ ATPase. SCH28080 was used to validate the docking results. The results clearly indicate that these novel benzimidazole-pyrazole hybrids can present a new class of potential anti ulcer agents and can serve as new anti-ulcer drugs after further investigation [22].

Chandrajit Dohutia and et al used AutoDock 4.2 for receptor molecule for the docking and also study to probe the binding free energy between the ligand library and receptor. Autodock Tools (ADT) also used for optimize the receptor and ligand molecules. For preparation of the receptor molecule, polar hydrogens, Kollman charges and AD4 type of atoms were added, while Gasteiger charges were added on the ligands and maximum numbers of active torsions were given [23].

CONCLUSION:

This review totally focused on efficiency of AutoDock softwear and its different version such as AutoDock Vina, AutoDock 4.0, AutoDock 4.2.6 for molecular docking study. This information become benchmark for reseachers those uses the AutoDock softwear for study the different therapeutic activities like Antidiabetic activity, AntiMalarial activity, Antiurase activity, Anticancer activity, Antimycobacterial tuberculosis activity, Antioxidant activity, Etc. The AutoDock and its Tools are more efficient to determine the synthesis techniques, spectral analysis, docking simulation, photochemical activities, therapeutic effects, toxicological studies. These observation based on the present review have been becoming a helpful tool to guide researchers for molecular docking study. AutoDock softwear is helpful for researcher as thissoftwear is predicting docking score which is corelate with *Invivo* or *In vitro* activity. Sp this is the ultimate tool in drug discovery.

ABSTRACT

Liposome are risen up out of self-shaping lipid bi-layer upon hydration; liposomal medicate have job in strong medication detailing to improve therapeutics. Liposome definitions assists with diminishing poisonousness and increment aggregation at the objective site. New techniques for liposome readiness dependent on lipid medicate communication or liposome aura component. Likewise incorporate the restraint of quick freedom of liposome by diminishing molecule size, charge or surface hydration. The liposomes are portrayed by physical, substance and natural parameters. This method of medication have more security and viability to organization of a few classes of medications like antimicrobial, antiviral, antibodies, against tubercular, antifungal, medications and quality therapeutics. Utilizations of the liposomes are in the tumor treatment immunology, antibody adjuvant, eye issue, cerebrum focusing on, infective malady, dermatology. New improvements in this field is explicit restricting properties of a medication transporter of liposome to target cell as a tumor cell and explicit atoms in the body. Secrecy liposomes are particularly utilized as transporters for hydrophilic (water solvent) consumption of macrophages.

KEYWORDS: Preparations Method, Characterization, Liposome Classification, Liposomal Drugs in Cancer.

INTRODUCTION

Late improvements on the field of liposome, with malignancy treatment are principle region of intrigue. Liposomes are utilized to improve malignant growth treatment because of their ability to expand the dissolvability of inadequately hydrophilic antitumor medications. Liposomes were found around 40 years prior by A.D. Bingham. Significant enemy of tumor sedate doxorubicin figured as liposome in 1980 to improving the remedial record. Liposome definition are utilized to lessen harmfulness and increment collection at the objective site. Secrecy liposomes utilized as bearers for hydrophilic anticancer medications like doxorubicin. The liposomes are described on premise of physical, synthetic and natural parameters. These methodologies decrease tranquilize debasement and inert when its organization, they likewise increment the medication's bioavailability and the part of medication conveyed in the obsessive territory, they improving adequacy and additionally limiting medication poisonousness. Liposomes as drug carrier with great variety of molecules such as nucleotide, small drug molecules, proteins, plasmids.(Anwekar, Patel, and Singhai 2015)

DEFINATION AND STRUCTURE OF LIPOSOME

(Shashi K., 2012)

When phospholipids spread in water, they form close structure with internal aqueous environment bounded with phospholipid bilayer membranes, and create vesicular system is called as liposome. Liposome is spherical sac of phospholipid molecule enclosing water droplet as formed to carry drug or other substance into the tissue. Liposomes are spherical vesicles composed one or more lipid bilayers, involve an aqueous compartment.

Basic structure & composition of liposome

Biodegradable and biocompatible phospholipids and sphingolipids are the lipids that are most commonly used to prepare liposomes. These structural lipids can be natural or synthetic origin, natural origin consist mixture of various lipids. Cylindrical molecular-shape lipids, such as phosphatidylcholine, phosphatidylserine, phosphatidylglycerol, and sphingomyelin, are choose for liposome formulations. These lipids, are used due to their appropriate stability and their ability to act again changes in pH or salt concentrations in the product or biological environment.

Conventional liposomes possess different lipid compositions, the most commonly used lipids are cholesterol and phosphatidylcholines. Drawback of conventional liposomes is their rapid uptake by MPS after systemic administration. In 1980, development of long-circulating liposomes increases interest in the

YASHODA TECHNICAL CAMPUS 6757 SATARA

DIRECTOR
Yashoda Technical Campus
Satara

clinical application of liposomes as a drug delivery system for various types' cancer treatment.

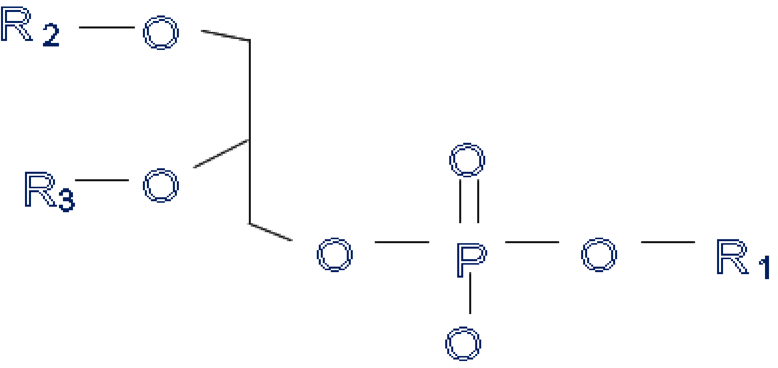

Fig. 1: Chemical Structure of Liposome.

Classification

1. Classification Based on Structure

Types of vesicle with their Dimeter Size and Number of Lipid Bilayers

Vesicle Type	Abbreviation	Diameter Size	No of Lipid Bilayer
Unilamellar vesicle	UV	All size range	One
Small Unilamellar vesicle	SUV	20-100 nm	One
Medium Unilamellar vesicle	MUV	More than 100nm	One
Large Unilamellar vesicle	LUV	More than 100nm	One

2. Based on Method of Preparation

Liposome Preparation Methods and Formed Vesicles types

Preparation Method	Vesicle Type
Single lamellar vesicle made by reverse phase evaporation	REV
Multi lamellar vesicle made by reverse phase evaporation	MLV-REV
Stable lamellar vesicle	SPLV
Frozen lamellar vesicle	FATMLV
extrusion technique	VET
Dehydration- Rehydration method	DR V

3. On basis of Composition and Application

Liposome and their Compositions

Type of Liposome	Abbreviation	Composition
Conventional liposome	CL	Negatively or neutral charge cholesterol and phospholipids
Fusogenic liposome	RSVE	Reconstituted sendai virus envelops
Cationic liposome	-	Cationic lipid with DOPE
Long circulatory liposome	LCL	Neutral high temp, cholesterol, and 5-10% PEG, DSP
Immune liposome	IL	recognition sequences or LCL with attached monoclonal antibody

4. on basis of Conventional Liposome

A. Mixtures of Stabilize natural lecithin
B. Chain phospholipids, Synthetic identical
C. Glycolipids.

5. on basis of Specialty Liposome

A. Bipolar fatty acids
B. Liposome directed by Antibody.
C. Methyl/ Methylene x- linked liposome.

Biological Properties of Liposome

1. Liposomes are biocompatible.
2. Liposomes can entrap water-soluble (hydrophilic) pharmaceutical agents in their internal water compartment and water-insoluble (hydrophobic) pharmaceuticals into the membrane.
3. Liposome-incorporated pharmaceuticals are protected from the inactivating effect of external conditions, yet do not cause undesirable side reactions.
4. Liposomes provide a unique opportunity to deliver pharmaceuticals into cells or even inside individual cellular compartments.
5. Size, charge and surface properties of liposomes can be easily changed by adding new substance to the lipid mixture before liposome preparation.

Mechanism of Liposome in Body

Liposome attaches to cell membrane and releasing their content into the cell. They are taken by the cell and their phospholipids are incorporated into the cell membrane. In the case of phagocyte cell, the liposome are taken up the phospholipid walls are act on organelles called lysosomes and the active pharmaceutical substance are released.

METHODS OF LIPOSOME PREPRATION (Lasic 1995)

At the point when phospholipids are hydrate liposome are shaped. Liposome arranged by three stages: vesicle development, vesicle size decrease, and decontamination. Arrangement techniques dependent on the creation and different contemplations, for example, tranquilize exemplification proficiency, the medication's physicochemical attributes, and the organization course. The most usually utilized strategies for liposome readiness are lipid hydration and the substitution of natural solvents by a fluid media. The lipid hydration by vortex or manual mixing, known as Bang ham's strategy.

This technique comprises of dissolving the lipids in an appropriate natural dissolvable, for example, methanol or chloroform. This procedure is trailed by expelling the dissolvable under diminished tension, revolving vanishing, until a meager film has been shaped. After, slim film is hydrated in a fluid medium, over the stage change temperature, bringing about the development of MLV liposomes. This is the least complex technique for vesicle arrangement; be that as it may, it is restricted being used on account of its low exemplification capacity. There are several groups of phospholipids that can be used for the liposome preparation which are as follows:

I. Natural source Phospholipids
II. Modified Phospholipids from natural source
III. Semi synthetic phospholipids
IV. Fully synthetic phospholipids
V. Phospholipids with natural head groups

Cholesterol can be added to the bilayers mixture for the following purposes:

1. Act as a fluidity buffer.
2. Cholesterol intercalated with phospholipids molecules they Alters the freedom of carbon molecule formation of in the acyl chain.
3. Transformation of Trans to gauche conformation is restrict.

Cholesterol decreased the permeability coefficients of positive, negative, neutral as well as negatively charged membranes to K+, Na+, Cl- and glucose. Cholesterol is necessary for lowering the membrane permeability, and imparting better stability. Cholesterol also modulates membrane-protein interactions.

Strategies for the preparation of liposomes:

1. Mechanical methods

A. Film Method

The original method is simplest procedure for the liposome formation, in this technique liposome are prepared by hydrating thin lipid film in an organic solvent then organic solvent is removed by film deposition under vacuum. When all the solvent get removed, the solid lipid mixture is hydrated by using aqueous buffer. The lipids spontaneously hydrate and swell to form liposome.

B. Ultrasonic Method

Ultrasonic method is used for the preparation of SUVs with diameter in the range of 15-25 m. Ultra-sonication of an aqueous dispersion of phospholipids is done by either probe sonicators or bath sonicators. The probe sonicators used for the small volume which requires high energy and bath sonicators are employed for the large volume.

METHODS BASED ON REPLACEMENT OF ORGANIC SOLVENTS

In that method lipids is co-solvated in organic solution, then dispersed into aqueous phase which containing material to be entrapped within the liposome. Replacement of organic solvents has two types:

A. Reverse Phase Evaporation: The lipid mixture is added in to round bottom flask and solvent is removed under reduced pressure by using rotary evaporator. This system is purged with nitrogen and lipids they re-dissolved in the organic phase. Diethyl ether and isopropyl ether is used as solvents. After re-dissolution of lipid the emulsion is obtained then the solvent is removed from emulsion by evaporation into semisolid gel under reduced pressure. Then Non encapsulated material is removed. The resulting liposomes are called reverse phase evaporation vesicles (REV). Reverse Phase Evaporation used for the preparation of large uni-lamellar and oligo-lamellar vesicles formulation and also

Satara

it has the ability to encapsulate large macromolecules with high efficiency.

B. Ether Vaporization Method: There are two method according to the solvent used: a) Ethanol injection method. b) Ether injection method. In ethanol injection method, the lipid is inserted rapidly through a needle into an excess of saline or other aqueous medium. In ether injection method the lipid is inserted slowly through a needle into an excess of saline or other aqueous medium.

METHODS BASED ON FUSION OF PREFORMED VESICLE OR SIZE TRANSFORMATION

A. Freeze Thaw Extrusion Method: This method is an extension of the classical DRV method. Liposomes is prepared by the film method is vortexed with the solute is entrapped until the entire film is suspended and the resulted MLVs is frozen into Luke warm water and then again vortexed. After 2 cycles of freeze thaw and overtaxing the sample is thrust three times. This is followed by 6 freeze thaw cycle and addition eight thrust. This process break and defuses SUVs during which the solute equilibrates between inside or outside and liposome themselves fuse and boost in size to form large Uni lamellar vesicle by extrusion technique (LUVET). This method is widely used for the encapsulation of protein.

B. The Dehydration- Rehydration Method: In this method the empty buffer which containing SUVs and rehydrating it with the aqueous fluid containing the material is entrapped after they are dried. This leads to a dispersion of solid lipids in finely subdivided form. The vesicles are rehydrated. Oligo lamellar vesicle liposomes obtained by this method.

LIPOSOME CHARACTERIZATION (Koudelka S, Masek J, 2010)

After preparation and before use in immunoassay the liposome must be characterized. Evaluation could be classified on basis of physical, chemical and biological methods. The physical methods include parameters such as shape, surface features, size, Lamellarity, drug release profile, phase behaviors.

Methods of liposome characterization

CHARACTERISTICS	METHODOLOGY
Phospholipids quantification	Bartlett method (Lipid phosphorus content)
Lysophospholipids quantification	Bartlett method combined with Liquid chromatography
Lipid oxidation	Spectroscopy, high-performance liquid chromatography (HPLC), gas-liquid chromatography (GC), TLC,
Determination of the encapsulation percentage	Spectrophotometry, fluorescence spectroscopy, enzyme-based methods, electrochemical techniques and HPLC
Size	field-flow fractionation and analytical centrifugation, microscopy techniques (light, electronic and atomic force), Static and dynamic light scattering, size-exclusion chromatography,
Surface charge	electrophoretic mobility associated with the Photon correlation spectroscopy
Lamellarity	Nuclear magnetic resonance (^{31}P-NMR), electron microscopy, small angle X-ray scattering
Lipid phase	X-ray diffraction, differential scanning calorimetry
Phase-transition temperature	Differential scanning calorimetry and nuclear magnetic resonance (^{31}P-NMR or ^{1}H-NMR)

Biological characterization is used in establishing the suitability and safety of formulation for the in vivo application for therapeutic use. The characteristics of the carrier with appropriate choice of size, membrane components, charge determines the final behavior of liposomes in-vitro and in-vivo.

Characterization of Liposomes with their Quality Control Assays.

A. Biological Characterization

Characterization parameter	Instruments for analysis
Sterility	Aerobic/anaerobic
Pyrogenicity	Rabbit fever response
Animal toxicity	Monitoring survival rats

EJPMR COPY PROOF

B. Chemical Characterization

Characterization parameter	Instruments for analysis
Phospholipid Concentration	HPLC / Barrelet assay
Cholesterol Concentration	HPLC / Cholesterol oxide assay
Drug Concentration	Assay method
Phospholipid peroxidation	UV observance
Phospholipid hydrolysis	HPLC / TLC
Cholesterol auto oxidation	HPLC / TLC
Antioxidant degradation	HPLC / TLC
PH	PH meter
Osmolarity	Osmometer

C. Physical Characterization

Characterization parameter	Instruments for analysis
Vesicle shape and surface morphology	TEM and SEM
Vesicle Size and size distribution	Dynamic light scattering, TEM
Surface Charge	Free flow Electrophoresis
Electrical surface potential and surface PH	Zeta potential measurement
Lamellarity	P^{31} NMR
Phase behavior	DSC, Freeze facture electron microscopy
Percent capture	Gel exclusion
Drug release	Diffuse

Stratergies to Optimize Liposome Stability (Abdelwahed W, 2006)

Business item including in liposome plan contain security attributes and timeframe of realistic usability over one year. It is presently conceivable to acquire a reproducible readiness of enormous volumes of stable liposomes and long haul security issues have additionally been effectively explained.

Security of liposomes is significant part in their improvement for pharmaceutical applications. Potential utilization of liposomes as helpful instruments is tested by their inborn synthetic and physical shakiness in water mediums, they can bring about expanded bilayer porousness and vesicle combination, resulting drug spillage and precipitation. Dangers of liposome is invigorated by bilayer surrenders instigated by synthetic debasement and by physical factors(heating or freezing) because of stage advances happen when these fluid scatterings is put away for expanded periods. The significant method to support liposome dependability is to get ready suitable plan, which help for the choice of the proper lipid fixation and organization, also the expansion of different substances for improve its timeframe of realistic usability. Item that can assists with expanding liposomal soundness include lyophillization and proficient detailing. Definition includes the choice of the appropriate lipid sythesis, centralization of bilayers, cancer prevention agent, and watery stage fixings as supports, cryo protectants and metal chelators. Charge including lipid as phosphotidyl glycerol consolidate into liposome bilayers to lessen combination while cholesterol and sphingomyelin can be remembered for the detailing to diminish penetrability and spillage of epitomized substance. Supports at impartial pH help to diminish hydrolysis; expansion of cancer prevention agent, for example, sodium ascorbate can decrease oxidation. In general, formulation of stable liposomal drug product requires the following precautions:

1. Processing with purified, fresh lipids and solvents.
2. Avoidance of high temperature and excessive shear forces.
3. Maintenance of low oxygen potential.
4. Use of metal chelators and antioxidant.
5. Formulating at neutral pH.
6. Lyo protectant used for freeze drying.

LIPOSOME IN CANCER THERAPY (Hofheinz RD, 2005)

The drawn out treatment of anticancer medication prompts a few harmful reaction. The liposomal treatment for the focusing to the tumor cell have been altered the universe of malignancy treatment with least reaction. It has been said that the little and stable liposome are inactively focused to various tumor since they can circle for longer time and they can extra vasate in tissue with improved vascular penetrability. Liposome macrophage take-up by liver and spleen hampered the improvement of liposome as medication conveyance for more than 20 years.

Liposomes have been utilized as bearers of platinum mixes (cisplatin and oxaplatin), anthracyclines (doxorubicin and daunorubicin), paclitaxel, camptothecin subordinates, antimetabolites (methotrexate, cytarabine), and Vinca alkaloids (vincristine, vinblastine and vinorelbine), planned for decreasing the poisonous reactions of cytostatic drugs without hampering their viability. Their applications depend on the capacity of liposomes to change the tissue dispersion of the ensnared tranquilize, which gets reliant on the physicochemical highlights of the liposomes and not the embodied

Satara

substance. In malignant growth chemotherapy, the uninvolved focusing of liposomes exploits the inborn size of nanoparticles and the exceptional properties of tumor vasculature. As tumors develop and exceed the accessible flexibly of oxygen and supplements, they discharge particles that enroll fresh blood vessels to the tumor in a procedure called angiogenesis. Not at all like the tight veins in typical tissues, angiogenic veins in tumor tissues contain holes as extensive as 600 to 800 nm between contiguous endothelial cells.

This nature of tumor angiogenesis, combined with poor lymphatic waste, prompts an upgraded penetrability and a maintenance impact (EPR). Thusly, long-circling liposomes will specially extravasate from these anomalous vessels and can specifically gather inside the tumor interstitiumty or common capacity to target malignant growth. The endothelial dividers of all sound human vein are embodied by endothelial cells limited together by close intersections. These tight intersections help to stop the enormous molecule in blood from spilling out of the vessel. Such sort of plan isn't there in the event of tumor vessel and subsequently is demonstratively "cracked". This capacity is knownas upgraded penetrability and maintenance impact. Liposomes of size under 400 nm, can quickly enter tumor locales from blood, however these are then kept in circulatory system by endothelial divider in solid tissue.

Platinum compound: (Mishra 2004)

Cisplatin (CDDP) is one of the most effective chemotherapeutic agents used by intravenous route in the treatment of ovary, lung, testicle, head, and neck carcinomas. Furthermore, CDDP has been widely used in the treatment of peritoneal carcinomatosis by intraperitoneal route. However, the administration of CDDP by both routes is still hindered by toxicity, mainly nephrotoxicity. Conventional liposomes composed of phosphatidylcholine/ phosphatidylserine/ CHOL containing CDDP were evaluated in IgM immunocyto bearing LOU/M rats.

An increased tumor platinum uptake and a significantly improved antitumor effect could be observed with the use of SPI-077, as compared to free CDDP. Another long-circulating liposomal formulation containing CDDP made up of soy phosphatidylcholine (SPC)/ DPPG /CHOL/DSPE-PEG2000 is called Lipoplatin®. This formulation was developed to reduce the systemic toxicity of CDDP while simultaneously improving the targeting of the drug to the primary tumor and metastasis by enhancing the circulation time in body fluids and tissues. Cytotoxicity studies of this formulation were performed in cell lines derived from non-small cell lung cancer, renal cell carcinoma, and in normal hematopoietic cell precursors.

Lipoplatin®, when compared to CDDP, produced a stronger cytotoxic effect in both evaluated tumor cells lines and a lower toxicity in normal bone marrow stem cells. Antitumor efficacy of Lipoplatin® was assessed in xenografts of human breast, prostate, and pancreatic cancer, where a reduction in tumor size could be observed. Measurement of platinum levels in the plasma of patients as a function of time showed that a maximum platinum level is attained at 6-8 hrs. The half-life of Lipoplatin® was 60-117 hrs, depending on the dose. The determining of platinum levels in excised tumors and normal tissues showed that Lipoplatin® has the ability to preferentially concentrate on the malignant tissue (10-50 fold) of both primary and metastatic origin.

The pharmacokinetic profile of Lipoplatin® in combination with 5-fluorouracil showed that the liposomal formulation has a greater body clearance and a shorter half-life than does free CDDP, which confirms the clinical observation of decreased toxicity, especially nephrotoxicity. Phase I, II, and III trials have shown that Lipoplatin® presents similar antitumor efficacy to CDDP in pancreatic, head and neck, breast cancers, and non-small cell lung carcinoma, as well as reduced toxicity, nephrotoxicity. Although CDDP is one of the most widely used chemotherapeutic agents, the development of tumor cell resistance against CDDP is a limitation in the clinical application of this drug. The lipid composition of liposomes contained SPC/CHOL/distearoyl phosphatidyl ethanol aminepolyethyl eneglycol (DSPE-PEG). CDDP-containing liposomes were prepared, and the target ability of transferrin receptors (TfR) to correlate CDDP cell uptake with cytotoxicity in sensitive and CDDP resistant ovarian cancer cells.

These liposomes were stable in plasma, circumvented the preclinical resistance to treatment with CDDP. CDDP has also been widely used in the treatment of peritoneal carcinomatosis by the intraperitoneal route. However, CDDP, a low-molecular-weight compound, is rapidly absorbed by the capillaries in the i.p. serosa and transferred to the bloodstream, inducing the appearance of systemic side-effects, such as nephrotoxicity.

Oxaliplatin an analoge of CDDP, has shown a good in vitro and in vivo antitumor effect and a better safety profile than cisplatin. However, the use of oxaliplatin is associated with side-effects which include neurotoxicity, hematologic toxicity and gastrointestinal tract toxicity. Lipoxal® is a liposomal formulation of oxaliplatin made up of hydrogenated soy phospahatidylcholine (HSPC)/DPPG/ CHOL/DSPE-PEG. This liposomal formulation containing oxaliplatin has also proven to induce the complete disappearance of human breast cancers in mice after 6 intravenous injections with 4 days intervals at a dose of 16 mg/Kg. On the other hand, the free oxaliplatin at its MTD could only cause shrinkage, not the disappearance of tumors.

Anthracyclines compound: (Leonard RCF, 2009)

The anthracyclines, represented by doxorubicin, daunorubicin, and their derivatives (Figure 9), are widely

EJPMR COPY PROOF
6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

used in the treatment of several hematological and solid tumors and are considered to be a first-line therapy for advanced breast cancer [100]. Although conventional anthracyclines have been extensively used for the treatment of a variety of cancers.

Cardiotoxicity can be increased nearly four-fold when these drugs are administered in association with other chemotherapeutic drugs. Ability of liposomes containing daunorubicin (DNR), made up of DSPC/CHOL.

Another commercial product of conventional liposome (Myocet®), in combination with cyclophosphamide, has been approved in Europe as a first-line treatment of breast cancer. This liposome consists of egg phosphatidilcholine (EPC)/ CHOL and encapsulated doxorubicin (DXR). The ability of Myocet® to locate tumors could be observed in ascitic (L1210 ascitic lymphoma). Doxil®/Caelix® was the first and is still the only long-circulating liposome formulation to be approved in both the USA and Europe to treat Kaposi's sarcoma and recurrent ovarian cancer. Indicating that the pharmacokinetics of liposomal DXR is governed by the liposome carrier and that most of the drug is delivered to the tissues in liposome-associated form [115]. Several studies are currently in progress using Doxil®/Caelix® to treat other malignancies, such as breast cancer and recurrent high-grade glioma.

Other chemotherapeutic agents

Another important drug in cancer therapy is paclitaxel. This is an alkaloid which stabilizes microtubules and inhibits endothelial cell proliferation, motility, and tube formation. Some studies have presented difficulties in the development of liposomes containing paclitaxel due to its hydrophobic nature. Therapeutic efficacy studies performed in a mouse xenograft model of human ovarian (OVCAR-3), human lung (A-549), breast (MX-1), and prostate (PC-3) cancer, as compared to the administration of free drugs, demonstrated greater tumor growth inhibition after the administration of liposomal paclitaxel. In addition, toxicology studies have shown that liposomal paclitaxel is less toxic than free paclitaxel. An improved pegylated liposomal formulation of paclitaxel was developed, demonstrating that cytotoxicity in human breast cancer cell lines (MDA-MB-231 and SK-BR-3) of the tested paclitaxel formulation was equipotent after 72 hrs of incubation, when compared to Taxol®.

RECENT ADVANCES IN TARGETED LIPOSOME

(Sawant RR, 2012)

In an attempt to improve the binding and cellular internalization of liposomes in the tumor area, several ligands were attached to the liposome surface, including monoclonal antibodies, folate, transferrin, vasoactive intestinal peptide (VIP), epidermal growth factor (EGF), hyaluronan, galactosides, and condroitin sulphate.

The majority of research in this area is related to cancer targeting, which uses a variety of monoclonal antibodies. To target HER2-overexpressing tumors, it was suggested that antiHER2 long-circulating liposomes be used. Nucleosome-specific monoclonal antibody (maybe 2C5) capable of recognizing various tumor cells through the tumor cell surface-bound nucleosomes significantly improved Doxil®, by targeting to tumor cells, and increased its cytotoxicity both in vitro and in vivo in different testing systems, including the intracranial human brain U-87 tumor xenograft in nude mice. The same antibody was also used to effectively target long circulating liposomes loaded with an agent for tumor photodynamic therapy (PDT) for both multiple cancer cells in vitro and experimental tumors in vivo, and provided a significantly enhanced elimination of tumor cells under PDT conditions.

Saccharide molecules represent good models for tumor targeting molecules, as many malignant cells express the lectin, sugar-binding protein. They concluded that disaccharide-modified liposomes may be promising cancer targeting carriers which can enhance intracellular uptake and cytotoxicity of the drug-loaded liposomes by means of lectin-mediated endocytosis.

One approach that has received considerable attention has been the use of folic acid to deliver drugs selectively to folate receptor-expressing cancer cells. Studies of folate-conjugated liposomes containing DNR or DXR showed an increased cytotoxicity of the encapsulated anticancer drugs in various tumor cells. The i.v. administration of anti-tumorassociated glycoprotein (TAG)-72 Polyethyleneglycol (PEG)-immunoliposomes showed that they were more effectively located in LS174 T human colon cancer cells than conventional liposomes.

FUTURE PERSPECTIVE AND CHALLENGE

(Cukierman and Khan 2010)

The more prominent enthusiasm for the advancement of these complex medication conveyance frameworks is to improve the adequacy and decline the symptoms of new and old enemy of malignant growth drugs. In this specific circumstance, the advanced pharmacokinetic properties of liposomes, bringing about an improved harmfulness profile, is as yet the principle contention for the utilization of liposomal transporters. Other new methodologies in the science and pharmacokinetic conduct of liposomes, for example, the counter angiogenic properties of cationic liposomes, just as the advancement of immunoliposomes or antisense oligonucleotides, likewise offer an incredible restorative collection for these medication conveyance frameworks. There are numerous issues with respect to the shakiness of particles through flocculation and total, their mind boggling stream, and bond designs in the slender system, the heterogeneity of the entrance of medications to explicit tumor locales, the dispersion of free medications, and nanoparticles in tumor tissues just as in single cells.

EJPMR COPY PROOF
YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Many research bunches are taking a shot at progressively "dynamic" treatments that adventure focusing on ligands to convey joined cytotoxic medications specifically to threatening cells. These ligands explicitly perceive and specially tie receptors found on the cells of intrigue, subsequently taking into consideration an increasingly exact conveyance technique. Albeit current investigations have indicated that the utilization of these focused on nanoparticles as a medication conveyance framework is a promising methodology to treat human malignant growths, it is still in its beginning time of advancement. Clinical information utilizing focused on nanoparticles are constrained, since most focused on nanoparticles have not yet arrived at the clinical level.

APPLICATION OF LIPOSOME (Dua J.S, 2012)

1. Enhance drug solubilisation (Amphotericin-B, Minoxidil, Paclitaxels, and Cyclosporins)
2. Protection of sensitive drug molecules (Cytosine arabinosa, DNA, RNA, Anti-sensoligo-nucleotides, Ribozymes)
3. Enhance intracellular uptake (Anticancer, anti-viral and antimicrobial drugs)
4. Altered pharmacokinetics and bio-distribution (prolonged or sustained released drugs with short circulatory half-life).

Liposomes can be utilized additionally to convey drugs into the lung. This is frequently done by inward breath of liposome vaporized. This can be utilized either for the treatment of different lung issue, diseases, asthma, or utilizing lungs as a medication stop for the fundamental conveyance. By fitting lipid sythesis an assortment of discharge energy can be acquired. One of the potential uses of these pressurized canned products is in the asthma alleviation wherein the dosing recurrence can be significantly diminished and single inward breath can last expedite. Oral uses of liposomes are at present fairly restricted due to the very liposomicidal condition in stomach and duodenum and regularly the organization of free or liposome epitomized sedate displays ordinarily no distinctions. Intragastrical organization, in any case, shows that liposomes upgrade the foundational bioavailability of certain water insoluble medications and nutrients.

A few structures to balance out liposomes in low pH, degradative catalyst, and bile salts containing situations are being contemplated. Improved solvency of lipophilic and amphiphilic drugs. Models incorporate Porphyrins, Amphotericin B, Minoxidil, a few peptides, and anthracyclines, separately; besides, sometimes hydrophilic medications, for example, anticancer operator Doxorubicin or Acyclovir can be epitomized in the liposome inside at focuses a few crease over their fluid solvency.

This is conceivable because of Precipitation of the medication or gel development inside the liposome with suitable substances typified Passive focusing to the cells of the safe framework, particularly cells of the mononuclear phagocytic framework (in more established writing reticuloendothelial framework). Models are antimonies, Amphotericin B, porphyrins and furthermore immunizations, Immunomodulators or immunosupressors. Supported discharge arrangement of fundamentally or privately controlled liposomes. Models are doxorubicin, cytosine arabinose, cortisones, natural proteins or peptides, for example, vasopressin. Site-evasion instrument: liposomes don't arrange in specific organs, for example, heart, kidneys, mind, and sensory system and this lessens cardio-, nephro-, and neuro-harmfulness. Run of the mill models are decreased nephrotoxicity of Amphotericin B, and diminished cardiotoxicity of Doxorubicin liposomes.

Site specific focusing: in specific cases liposomes with surface connected ligands can tie to target cells ('key and lock' instrument), or can be conveyed into the objective tissue by neighborhood anatomical conditions, for example, flawed and gravely shaped veins, their basal lamina, and vessels. Models incorporate anticancer, hostile to contamination and against inflammatory drugs.

CONCLUSION

This undertaking presumed that liposome as transporter which are the most generally utilized medication nanoparticles in malignancy medicines. Essential ideas were introduced concerning liposomes and a review of the clinically utilized and tried liposomes for the treatment of malignancy. It has been illustrated, in view of earlier examinations, that liposomes offer wellbeing and adequacy when contrasted with other customary medications. Liposome framework is to improve viability and abatement symptom of new and old enemy of malignant growth drugs.

The new advancements in the liposome are the particular restricting properties of a medication conveying liposome to an objective cell (tumor cell and explicit particles), secrecy liposomes for focusing on hydrophilic (water dissolvable) anticancer medications like doxorubicin, mitoxantrone which prompts decline in symptoms on the grounds that the medication is for the most part amassed at the site of activity. Other advancement is bisphosphonate-liposome intervened consumption of macrophages. A few business liposomes have just been found, enrolled and presented with extraordinary achievement in pharmaceutical market. There is much more noteworthy guarantee in future for promoting of progressively complex and profoundly balanced out liposomal details. In future the liposomal tranquilize conveyance framework will reform the vesicular frameworks with wide application particularly in the treatment of malignant growth.

Abstract

Pectin is a naturally occurring biopolymer. It has been used successfully for many years in the food and beverage industry as a thickening agent, a gelling agent and a colloidal stabilizer. In this review, study of the role of pectin polysaccharides, including its various pharmacological activity, such as its immuno-regulatory, anti-inflammatory, hypoglycemic, antibacterial, antioxidant and antitumor activities, have been summarized. The review provides natural sources, chemical structures, biological activities, and practical applications in the food industry as well as pharmacology and different branches of medicine. Pectin has become an essential part of the research and development of natural herbs and health products due to their wide availability.

Keywords: *- Citrus Pectin, Source, extraction, Biological activity, glycogen regulation.*

INTRODUCTION

French chemist Louis Nicolas Vauquelin in 1790 in tamarind fruit, discovered pectin in citrus fruits (Vauquelin, 1790). Henri Braconnot introduced the term "pectin" because of the gelling properties of these substances (Braconnot, 1825). Pectin is usually obtained from the residues of plant material after extracting the juice (apple or citrus peel) or sugar (sugar beet). This review will first describe the source and production, chemical structure and general properties of pectin. Pectin is the methylated ester of polygalacturonic acid, contains 1, 4-linked D-galacturonic acid residues.

STRUCTURE OF PECTIN

Pectin is a polysaccharide with a core consisting of α-1,4-linked D-galacturonic acid and α-1, 2-L-rhamnose, large number of neutral sugars, including arabinose, galactose, and lesser amounts of other sugars. The structural classification of pectin includes: homogalacturonan (HG), rhamnogalacturonan I (RG-I), and substituted galacturonans such as rhamnogalacturonan II (RG-II) (Figure 1). It composed of as many as 17 different monosaccharides and more than 20 different linkages. (Minzanova, Salima T et al. 2018)

GENERAL PROPERTIES OF PECTIN

Pectins are soluble in warm water. Monovalent cation salts of pectinic and pectic acids are usually soluble in water; di- and trivalent cations salts are weakly soluble or insoluble. Dry powdered pectin, when added to water, has a tendency to hydrate very rapidly, forming clumps.

Most important use of pectin is based on its ability to form gels. HM-pectin forms gels with sugar and acid. HM-pectin, unlike LM-pectin, does not contain sufficient acid groups to gel or precipitate with calcium ions, although other ions such as aluminium or copper cause precipitation under certain conditions. (Rolin C 1993), (Hercules Incorporated 1999). (Raj et al. 2012)

METHODSOF PECTIN PREPRATION

Sample Preparation

The samples (Cola milleni, Irvingia gabonensis and Theobroma cacao) peel and husk were sun dried for one week and making powder using blender. The powdered samples were sieved with a fine mesh of size 14mm. The sieved samples were kept in an air tight container prior to extraction process.

Extraction of Pectin (Oloye, 2013)

Extraction of pectin from the samples was performed under acid condition. The dried powder pectin was extracted by mixing with acidified distilled water inside a water bath at different temperatures ranges from 50 - 100°C and different time from 30 – 150 mins. After contact time reflux, the samples were filtered through cheesecloth and cooled; it was then centrifuged for 20 mins at 3,500 rpm. Ethanol 96% was added to the supernatant and allowed to stand for one hour for pectin precipitation. The precipitated pectin was separated by filtration, washed thrice its volumes with absolute ethanol and washed twice with water to remove impurity. The extracts were separately dried in an oven at 50°C and the pectin yield was determined. The dried pectin samples were stored in aluminium foils at 4°C until used.

Chemical Constituents: The neutral sugars that essentially form the side chains on the pectin molecules are namely: galactose, arabinose, xylose, and fructose. They also contain Saponin, Tannin, Alkaloid, Flavonoid, Steroid, Terpenoid, Glycoside and Phenol. (Oloye, 2013)

ROLE OF CITRUS PECTIN IN BIOLOGICAL ACTIVITY

Immunomodulatory Activity:

Immunomodulators are natural or synthetic substances that have a regulating effect on the immune system. Plant-derived polysaccharides, including pectin can directly activate the immune function of macrophages, promote the production of cytokines, and therefore regulate the immune system on multiple levels. The immunomodulatory activities of the oligomer fractions are still observed in the studies. Enzymatic digestion of pectin, which also show the value of the back bone of pectin.

The carbohydrate chain of pectin determines immunosuppressive activity. It was found that pectin containing more than 80% of galacturonic acid residues suppress the activity of macrophages and inhibit the delayed-type hypersensitivity reaction. In addition, the branched region of the pectin macromolecule mediates the stimulation of phagocytosis and increased production of antibodies. (Popov & Ovodov, 2013)

Anti-inflammatory Effect:

Inflammation has been considered as a main risk factor for different progressive illnesses in human beings, such as neurological disorders, cancer, metabolic diseases, and cardiovascular disease, and a primary strategy to prevent these diseases is to target the reduction of chronic inflammation. (Leivas C.L et al., 2016)The intake of dietary fibers such as plant cell wall polysaccharides enhances the efficiency of treatment of inflammatory processes. Much attention has been focused in recent years on pectin.

Popov et al. has studied the anti-inflammatory activity of citrus pectin in vivo after oral administration in mice. (Popov S.V et al., 2013)Three models of inflammation were used: cytokine production by blood leukocytes in response to lipopolysaccharide, acetic acid-induced colitis, and endotoxin shock.

The results of the study demonstrate that low methyl-esterified citrus pectin inhibits local and systemic inflammation, while

6757 YASHODA TECHNICAL CAMPUS SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Page 1-10 © MANTECH PUBLICATIONS 2020. All Rights Reserved

pectin with a higher degree of esterification can inhibit intestinal inflammation.

Antioxidant Activity:

Oxidation is vital to plenty of organisms that can generate energy to supply biological processes. In normal circumstances, free radicals govern cell growth, and suppress viruses and bacteria. Nevertheless, in large quantities and without regulation, the production of free radicals induced by oxygen cause cell damage, which renders the pathological progressions. The oxidative stress is associated with chronic obstructive pulmonary disease, asthma, diabetes, inflammation, cardiovascular diseases, and myocardial infarction. (Wang, J et al., 2016)

Antitumor Activity:

Many in vitro and in vivo studies concerning the antitumor activity of native and modified pectin revealed a decrease of adhesion and cell proliferation, as well as the induction of apoptosis and migration. (Bush, P et al., 2014) Maxwell et al. have assessed pectin from different sources (potato, sugar beet, larch, and citrus) for effects against colon cancer cells. (Maxwell,E.G et al.,2015) Extracts of potato pectin lowered the proliferation of colon cancer cells by the alteration of dose.

Sugar beet pectin extracts presenting various structures of pectin showed high anti-proliferative action against colon cancer cells. (Maxwell, E.G et al., 2016) The alkali treatment of pectin surged the antitumor activity of sugar beet pectin due to an apoptosis promotion. The pectic polysaccharide from apple can induce the death of cancer cells death and suppress the growth of tumors in vivo, as Delphi and Sepehri described. (Delphi, L et al., 2016)

Hypoglycemic / Anti-diabetic Effect:

Research was conducted to study the anti-diabetic effect of citrus pectin in diabetic rats and the potential benefits of citrus pectin to produce anti-diabetic effects in cases of T2DM caused by a low-dose streptozotocin and a fat-laden diet. Many tests have demonstrated that anti-diabetic polysaccharides effectively improve glucose tolerance.

Low-dose citrus pectin (500 mg/kg bw per day), the medium-dose citrus pectin (1000 mg/kg bw per day) and the high-dose

Satara

Page 1-10 © MANTECH PUBLICATIONS 2020. All Rights Reserved

citrus pectin (2000 mg/kg bw per day) intragastrically administered.

Citrus pectin reduced fasting blood glucose levels, benefited hyperlipidemia, and refined hepatic glycogen content glucose tolerance in the diabetic rats. Citrus pectin modulated the expression of the basic proteins in the PI3K/Akt signaling pathway, which could have influenced the enhancement of insulin sensitivity in the diabetic rats, possibly by signifying the anti-diabetic effect of citrus pectin. (Liu, Dong, Yang, & Pan, 2016)

Neuroprotective Effect:

We investigated the neuroprotective activities of ginseng pectin (GP) against hydrogen peroxide (H2O2)-induced neuronal toxicity in different neuronal cells. GP protects neuronal cells from hydrogen peroxide-induced cell death. GP protects cortical neuron cell neurites from degeneration. GP neuroprotective effect occurs through the activation of ERK/MAPK and Akt survival signaling pathways. Ginsenoside Rb1 has been shown to protect neuronal cells against hydrogen peroxide-induced cell damage possibly by scavenging free radicals, inhibiting the production of nitric oxide, preventing lipid peroxidation and avoiding decrease in SOD activity.

GP showed similar protective effects on neuronal cells against H2O2-induced oxidative stress via regulating the pro-survival ERK/MAPK and Akt pathways. Moreover, GP preserved the structural integrity of neurons, suggesting that it may be a new neurotrophin. In conclusion, GP appears to be anti-oxidant without side-effects, which may eventually lead to further development of therapeutics for neurodegenerative diseases. (Fan et al., 2012)

Glycogen regulation

Pectin decreased PKC (protein kinase-c) activity in liver and increased PKC activity in brain. (Kramer HK, 1997) Pectin also enhanced glycogenesis and reduced glycogenolysis. Activation of PKC stimulate the serotonin receptor or transporter in brain. (Vijayalakshmi, 2014).MCP prevents blood-brain barrier disruption possibly by inhibiting galectin-3.

DISCUSSION

Pectin structure provide significant immunomodulatory properties. However, future research studies necessary to verify

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

the immune activity in vivo and determine howthemechanismsofpectinaffectmacrophagesandotherimmunocytesforsafeclinical applications.

Studies of the antimicrobial properties of pectins show a general tendency for the development of nanocomposites and nanoemulsions on their base. Both exhibit noticeable inhibitory effects, mainly against Gram-negative Escherichia coli and Gram-positive Staphylococcus aureus. The analysis of the reviewed studies shows that pectin polysaccharides from various source demonstrate antioxidant activity. It was also shown that pectins of diverse chemical structure (HG, RG-I, RG-II) exhibit antioxidant properties. Hypoglycemic activity of pectins is useful for the development of low-toxicity antidiabeticagents.

Drugs based on dietary and medicinal plants don't cause side effects, which helps pectin promising for further research. Anti-inflammatory properties of pectin is given great attention in the literature, because pectin have a great potential for anti-inflammatory multi-purpose therapy. Another fast-growing field of pectin useful application is anti-cancer therapy, which is due to safety of pectin and its derivatives. However, the lack of research on pectin polysaccharide protection mechanisms and clinical trials has limited the application of pectin in the field of medicine thus far.

CONCLUSION

Recently updated knowledge about Citrus pectinplay beneficial role in various biological activity. Pectin extracted from Citrus fruits, Cola milleni, Irvingia gabonensis and Theobroma cacao. Pectin also enhanced glycogenesis and reduced glycogenolysis .Results of a study of the bioactivity of pectin polysaccharides, including its various pharmacological action, such as its immunoregulatory, anti-inflammatory, hypoglycemic, antibacterial, antioxidant and antitumor activities, Neuroprotective have been summarized.

ABSTRACT

Infertility due to polycystic ovarian syndrome (PCOS) is a worldwide problem that is increasing at alarming rates. It is characterized by chronic anovulation, polycystic ovaries, and hyperandrogenism leading to symptoms of irregular menstrual cycles, hirsutism, acne and infertility. Insulin resistance and elevated levels of male hormones (androgens) are associated with PCOS. The sedentary lifestyle, lack of exercise and dietary variations and stress etc., are also the contributory factors. Various plants like Panax ginseng, Punica granatum, Curcuma longa, Cinnamomum zeylanicum Tribulus terrestris, Symplocos racemosa, Trigonella foenum-graecum, Cocus nucifera etc., proved active in the treatment of PCOS. In this review, attempts have been made to summarize the important medicinal plants which are used in treatment or prevention of PCOS. Special attention is given to the role of insulin resistance and the potential utility of insulin sensitizers in management of PCOS.

INTRODUCTION

Polycystic ovary syndrome (PCOS) is one of the most common female endocrine disorders. It is recognized by the presence of enlarged ovaries with multiple small cysts and a hypervascularized androgen secreting stroma. The clinical symptoms include menstrual abnormalities, polycystic ovary, obesity, infertility, hairy, acne, and hyperandrogenism[1]. The polycystic ovary syndrome is a clinical diagnosis characterized by the presence of two or more of the following features: chronic oligo-ovulation or an-ovulation, androgen excess and polycystic ovaries[2].

World Health Organization (WHO) estimates that PCOS has affected 116 million women (3.4%) worldwide in 2012[3]. Polycystic ovary syndrome (PCOS) is a heterogeneous disorder of unknown etiology affecting 5%-10% of women of reproductive age[4]. Globally, prevalence estimates of PCOS are highly variable, ranging from 2.2% to as high as 26%. In India, experts claim 10% of the women to be affected by PCOS[5]. PCOS are strongly interlinked by the pathogenesis of various individual disorders; they may be broadly classified into endocrine dysfunction, reproductive dysfunction, metabolic dysfunction and biochemical dysfunction[6]. It is also associated with psychological impairments including depression and other mood disorders. Most women with PCOS are also overweight or obese, further enhancing androgen secretion while impairing metabolism and reproductive functions and possibly favoring the development of the PCOS[7]. Metabolic abnormalities such as dyslipidemia, insulin resistance, therefore, diseases including diabetes, obesity, cancer and infertility as well as coronary heart diseases could be seen along with PCOS[8]. Reactive oxygen species and antioxidants remain in balance in normal individual but when this balance is disturbed, oxidative stress develops[9]. Which may lead to different disorders. Increased oxidative stress contributes to the risk of cardiovascular disease in women with PCOS[10].

- Stress

PATHOPHYSIOLOGY OF PCOS

The Gonadotropic releasing hormone is secreted or synthesized Luiteinsing hormone (LH) and Follicle stimulating hormone (FSH). A less amount of intraovarian androgen is use for normal follicular growth. The follicular development provides by FSH and stimulating aromatase enzyme it promotes granulose cell conversion of androgen to oestrogen. LH is initiate of oocyte maturation by inducing theca cell production.

PCOS condition increases LH level and decreasing level of FSH causes to produce more androgen and reduced level of aromatase enzyme with immature follicle development. Excessive androgen in PCOS is related of abdominal fat that leading to Hyperinsulinemia and Dyslipidemia. Increase theca cell androgen production, Hyperinsulinemia reduces sex hormone binding globulin (SHBG) to increases circulating testosterone levels[12].

Screening Methods of Pcos

Androgen-Induced Rodent Models of PCOS[13]:

Hyperandrogenism is the primary manifestation of PCOS. One etiologic hypothesis of PCOS is that exposure to excessive androgens early in life leads to PCOS in adult hood. It was reported more than 3 decades ago that elevated concentrations of circulating androgens in the rodent affected ovarian follicular maturation and cyst formation. Several androgens have been used to induce an acute PCOS condition in rats through daily injection or subcutaneous implants, including dehydroepiandrosterone (DHEA), testosterone propionate (TP), and 5a-dihydrotestoterone (DHT). It is important to note that there is some inconsistency between studies in the reporting of endocrine hormones and ovarian histology in different models. In addition, several studies have not assessed Cardiometabolic parameters, and effects of daily androgen injection and/or treatment on physiologic indices such as body weight, stress indicators, or food intake are not usually reported. In these rodent models the pathological induction of PCOS is transient and dependent on androgen treatment. Hence the re-establishment of normal reproductive/ovarian cycling occurs after cessation of andro- gen administration.

DHEA-induced PCOS[13]: Dehydroepiandrosterone is the first androgen to rise in the female peripubertal period. It has been demonstrated that nearly 50% of follicular-synthesized T can be derived from circulating DHEA, and 25% of patients with PCOS demonstrate supranormal circulating DHEA concentrations. Dehydroepiandrosterone was first used by Roy et al. to induce PCOS in rats. Typically, prepubertal rats, aged approximately 22 days, are injected daily with DHEA (6 mg/100 g body weight, dissolved in 0.2 mL of sesame oil) for up to 20–27 days. After treatment, rats become acyclic and anovulatory.

Ovarian Morphology: Dehydroepiandrosterone-induced rats develop varied severity of cystic ovaries, with multiple follicular cysts ranging in size from 0.45 to 2.2 mm in diameter, and these have degeneration of granulose cell layers. The ovarian tunica capsule is not thickened, and the ovarian weight of DHEA-treated rats is increased significantly.

Endocrine hormone profile: Serum DHEA, T, E_2, FSH, LH, and PRL concentrations are significantly increased in DHEA-induced rats compared with control animals, whereas no changes in plasma FSH and LH concentrations have been reported by other groups.

Cardiometabolic abnormalities: Wang et al. showed that fasting serum glucose and insulin concentrations were in- creased in DHEA-induced rats. The resistin messenger RNA level of white adipose tissue was elevated, which may induce obesity-mediated insulin resistance (IR) in this model.

Summary: The DHEA-induced model can be used to reflect early DHEA-related hyperandrogenemia, anovulation and cystic ovaries, and development of aberrations in insulin/ glucose metabolism.

TP-induced PCOS[14]: Testosterone is used to induce polycystic ovaries in immature female rats. In this protocol, 21-day-old animals are injected daily with TP (1 mg/100 g body weight dissolved in propylene glycol) for up to 35 days.

Ovarian morphology: The TP-induced rats have large multiple cystic follicles, hyperthecosis, and a thickened tunica capsule. Corpora lutea fail to develop at 56 days of age, in contrast to control animals. The proportion of preantral follicles increases after TP treatmen, which may be associated with increased early follicular development, as observed in human PCOS.

Endocrine hormone profile: Serum T, LH, and PRL levels are increased, whereas FSH, P, and E_2 levels are decreased in TP- treated rats.

Cardiometabolic abnormalities: TP-treated rats have normal to decreased fasting glucose concentrations, and insulin was increased, leading to a signif- icantly reduced glucose/insulin ratio. The results of these studies suggest that it is possible that excess T may lead to hyperinsulinemia.

Summary: The TP model is a direct model of hyperandrogenemia, T-induced anovulation and cystic ovaries, and development of impaired insulin/glucose metabolism.

DHT-induced PCOS*(15):* DHT, a nonaromatizable androgen, can induce both ovarian and metabolic aberrations in rodents. Three-week-old rats (juvenile) are implanted subcutaneously with 90-day continuous-release pellets containing 7.5 mg DHT (daily dose, 83 mg). Plasma DHT concentrations are elevated 1.7-fold in treated compared with control animals. Irregular ovarian cyclicity and polycystic ovaries are evident after 11–13 weeks of the DHT treatment.

DIRECTOR
Yashoda Technical Campus
Satara

Ovarian Morphology: Ovaries of DHT-treated rats display an increased incidence of atretic and cystic follicles, with reduced granulsa cell layers and hyperthecosis of internal cell layers. Interestingly, the ovarian weight of the DHT- treated animals is decreased, which is unlike other androgen-induced models and human PCOS (depending on the phenotype, for example not all cases present with enlarged ovaries).

Endocrine hormone profile: The plasma concentrations of T and E_2 are within the normal range, which is not representative of hyperandrogenemic phenotypes of PCOS, and P levels are diminished, indicating anovulation.

Cardiometabolic abnormalities: In addition to ovarian dysfunction, DHT-treated rats present with metabolic disturbances, including increased body weight associated with intra-abdominal adipose tissue, decreased insulin sensitivity (assessed by euglycemic– hyperinsulinemic clamp), and elevated plasma leptin concentrations. Despite these meta- bolic changes, which are consistent with PCOS and the metabolic syndrome in women, the DTH-induced model does not develop dyslipidemia. Approximately 70% of women with PCOS are dyslipidemia; therefore, the DHT-treated rodent model, which is resistant to blood lipid changes, may not be representative of this common phenotype of PCOS.

Summary: The DHT model mimics the actions of T and indicates androgen receptor–mediated effects. Although it does not demonstrate hyperandrogenemia, it does have irregular cyclicity and cystic ovaries, which may be used to represent the normoandrogenic phenotype of PCOS in women. The DHT-induced model also provides a model to explore the development of aberrations in insulin, glucose, leptin metabolism, and adiposity in PCOS.

Letrozole-Induced (Aromatase Inhibitor) Rodent Model of PCOS(15)

Aromatase is the key enzyme that converts T and androstenedione into E_2 and estrone, respectively. It is widely expressed in human tissues, such as placenta, ovary, and testis. Reduced aromatase activity in the ovary is one of the pathophysiologic hypotheses of PCOS development. Letrozole is a nonsteroidal aromatase inhibitor that reduces conversion of androgens to estrogens in the ovary, resulting in increased T and decreased E_2 production. Excess T in the ovaries is likely to cause polycystic ovaries directly in Letrozole-treated rats. The reduction in estrogen weakens the negative feedback on LH production in the pituitary, resulting in increased LH levels, which further stimulates theca cells to secrete T. Typically, 6-week-old female rats (puberty) are administered Letrozole orally at doses of 0.1, 0.5, and 1.0 mg/kg daily for 21 days, after which they become acyclic, with histological and biochemical features of human PCOS.

Ovarian morphology: The ovarian morphologic changes of Letrozole-induced rats include the development of cysts with hyperplasia of internal theca cells and a thickened ovarian capsule. The number of corpora lutea is decreased, indicating oligo/anovulation. However, unlike human PCOS, the ovarian weight of Letrozole-induced rats remains un- changed.

Endocrine hormone profile: The serum T and LH levels of Letrozole-induced rats are significantly elevated, and the P and E_2 levels are decreased in a dose-dependent manner. However, in this model, the FSH level is markedly increased in the higher-dose groups (0.5 and 1.0 mg/kg), which are not the typical characteristics of human PCOS.

Cardiometabolic abnormalitie: The metabolic characteristics of the Letrozole- induced rodent model of PCOS. After continuous administration of Letrozole (via a subcutaneous implant) before puberty (at 3 weeks of age) through to adulthood (12–16 weeks of age), no metabolic aberrations were observed, inclusive of adiposity, insulin sensitivity, and dyslipidemia.

Summary: The Letrozole model targets the study of aromatase deficiency–induced classic PCOS and may be an effective co treatment with other treatments that induce Cardiometabolic aberrations to study these factors in the PCOS condition.

HERBAL REMEDIES FOR PCOS

Panax ginseng (Ginseng): The roots of Panax ginseng (Araliaceae) is an herbal medicine. It is used as a tonic and it slow down the ageing properties. Ginseng saponins is active constituent of ginseng. They are composed of ginsenosides namely Rb1, Rb2, Rc, Rd, Re, Ro, Ra and minor ginsenosides. It is a suitable dietary supplement. Induced the polycystic ovary in rats by estradiol valerate. The study analyzed the ovarian morphology. Kampo preparations, is the one the ginseng containing formulation. It is formulation significantly decreases the plasma LH levels and thereby it is effective in improving endocrine condition in the treatment of disturbances of ovulation in patients with PCOS[16].

Tribulus terrestris (Puncture vine): Tribulus terrestris, (Zygophyllaceae) commonly known as Puncture vine or Devil's eyelashes plays an important role in traditional medicine. Tribulus terrestris was found to be effective in polycystic ovarian syndrome. In an investigation done in rats with polycystic ovaries induced with estradiol valerate, found that Tribulus terrestris extract is effective in improvement of ovulation in rats. The extract treatment normalized estrous cyclicity and steroidal hormonal levels and regularized ovarian follicular growth. Many herbalists find tribulus is an effective, overall ovarian stimulant and female fertility tonic, making it an excellent choice for women with polycystic ovary[17].

Gymnema sylvestre (Gymnema): Gymnema sylvestre (Asclepiadaceae) is a herb which is used in traditionally in Ayurvedic system of medicine. It has various pharmacological effects like antidiabetic, hypoglycemic, and lipid lowering effects. The active constituent of gymnema is saponins, especially gymnemic acids. gymnema has potential hypoglycemic activity in experimental models of diabetes. It regulates the blood glucose level. Metformin therapy for treatment of PCOS is convential. Therefore gymnema can be used for the underlying factor of insulin resistance. Gymnema is well indicated for PCOS, due to its insulin modulating activity and the added benefits of reducing the elevated triglycerides associated with PCOS.

Punica granatum (Pomegranate): Pomegranate (Punica granatum of the family Punicaceae) is one of the fruit and has various numbers of medicinal properties. The fruit contains folic acid, vitamins (B2, C, B1), sugars, pantothenic acid, and organic acids. The seed is reported to contain unsaturated and saturated fatty acids. The effect of

DIRECTOR
Yashoda Technical Campus
Satara

pomegranate extract in the control or managment of PCOS was performed in adult female rats using control and PCOS group. The concentration of free testosterone, serum estrogen and andrestandoin hormone levels in experimental group was monitored. The study suggests the protective effect of pomegranate extract on hormonal imbalances of polycystic ovarian syndrome. The phenolic compounds and phytosterols found in the extract have positive effect in improving the complications of PCOS. The study recommends that the consumption of the extract reduces complications associated with PCOS[18].

Aloe barbadensis (Aloe): Aloe barbadensis Mill. (Liliaceae) popularly known as Aloe vera is a well-known plant with various medical properties and pharmacological activities. For management and prevention of polycystic ovarian syndrome the Aloe Vera gel has used. The biochemical clinical characters of PCOS were investigated using female rat model. The phytocomponents of aloe vera formulation were analyzed for flavonoids, polyphenols, sterols and other nutrients. The female rats were then treated orally with the Aloe vera gel formulation. This restored their glucose sensitivity, estrus cyclicity, and the enzyme activity. The histological analysis found, that aloe vera reduce the ovary ateretic cysts. The results were compared with PCOS control. The studies indicate that aloe vera has potential efficacy or beneficial effect in the prevention and maintenance of PCOS[8].

Cinnamomum zeylanicum (Cinnamon): Cinnamon (Cinnamomum zeylanicum of the family Lauraceae) has insulin potentiating properties. Cinnamon is reported to contain polyphenols and procyanidins. This compound regulates the insulin stimulated glucose uptake and glycogen synthesis. A pilot study conducted in fifteen women with PCOS and then fasting and oral glucose tolerance test values were measured. The cinnamon extract improved the insulin sensitivity in women with PCOS. The polyphenols and procyanidins found in cinnamon extract are responsible for the hypoglycemic effect by potentiating the insulin signaling pathway. The study established the role of cinnamon as an adjunctive therapy in the treatment of PCOS. Another study reported the effect of cinnamon on menstrual cyclicity and metabolic dysfunction in women with PCOS. It was a randomized controlled trial with 45 women. Cinnamon supplement were given orally. luteal phase progesterone level and menstrual cyclicity were monitored. The cinnamon supplementation improved the menstrual cyclicity and it is effective for poly cystic ovary syndrome[19].

Glycyrrhiza glabra (liquorice): Liquorice (Glycyrrhiza glabra of the family Leguminosae) has been used in traditional medicine to treat various of diseases. It has antifungal, antiviral, antibacterial, and antihyperglycemic properties. Glycyrrhizic acid is the important bioactive compounds in liquorice. Liquiritigenin, liquiritin, isoliquiritin, isoliquiritigenin, glabidin, glabrene are some of the phytoestrogens present in liquoirice. Reported effects on vascular tissues in vitro and in vivo of two natural compounds derived from liquorice root: glabridin, the major glabrene and isoflavan, an isoflavene, both demonstrated estrogen-like activities. Liquiritigenin a selective estrogen receptor ligand might be one of the bioactive compound responsible for weight loss. Other compounds glabrene and glabridin have showed the effect on weight reduction in vivo. It has also been reported that the combined treatment with spironolactone and liquorice in hirsute women is effective in PCOS, in order to reduce the volume depletion induced by spiranolactone and possibly enhance its anti-androgenic activity.[20]

Symplocos racemosa (Lodh Tree): Symplocos racemosa Roxb. From the family Symplocaceae, is a widely used Ayurvedic remedy mainly for female disorders. It is also known as Lodhra and is used in Indian System of Medicine as single drug or in multi-component formulation and preparations. The anti-androgenic properties S. racemosa in the treatment of PCOS was investigated in Letrozole induced female rat model. Syplocus racemosa treatment show significant recovery of estrogen, testosterone, progesterone levels and ovarian tissues. It is prevents ovarian cell dysfunction in PCOS and improved the fertility[4].

Linum usittatissimum (Flaxseed): Flaxseed is obtained from Linum usittatissimum (Linaceae) a food generally renowned for its omega-3 fatty acid content, also one of the richest sources of dietary lignan. Several biologically active compounds like alpha- linolenic acid (ALA), lignans (secoisolariciresinol diglycoside-SDG), soluble flaxseed fibre mucilage (d-Xylose, L-Galactose, LRhamnose, dgalacturonic acid) which have significant health benefits. The studies on the use of flaxseed or isolated lignan suggest that it may decrease androgen levels and normalize lipid levels. Lignans seem to reduce the excess testosterone which plays a key role in the pathogenesis of PCOS. A case study reported that flaxseed supplementation may indeed help regulate androgen levels in women with PCOS. A significant decrease in androgen levels was observed in the study. Decrease in hirsutism also observed. Findings suggest that flaxseed may have a profound impact on testosterone levels, and also may reduces symptoms associated with hyperandrogenism, such as hirsutism. Another study reported the effect of flax seeds on ovarian morphology in PCOS and it has showed that flax seed supplementation significantly reduced the ovarian volume, number of follicles in the ovaries and improved the frequency of menstrual cycles. However the study did not find any change in hirsutism, blood sugar level and body weight[21].

Curcuma longa (Turmeric): Curcumin is a water-insoluble, low molecular weight, polyphenolic curcuminoid derivative found in rhizomes of Indian spice, Curcuma longa of the family Zingiberaceae (turmeric). Turmeric is extensively used as a food additive and coloring agent in Asian cuisine and also in Indian herbal medicine. Curcumin has been reported to possess a wide variety of biological effects like anti-inflammatory, antioxidant hypoglycemic antihyperlipidemic activities and estrogenic effects. A study was conducted in 30 female Albino Wistar rats, using Letrozole-aromatase inhibitor, to induce Polycystic Ovarian Syndrome. Its effect was comparable to that of Clomiphene citrate, most widely used treatment for ovulation induction in PCOS condition. Serum levels of Progesterone and Estradiol were decreased in PCOS induced group. Curcumin restored the hormone and lipid profile, antioxidant and glycemic status as well as ovarian morphology in Letrozole induced PCOS animals. Decreased progesterone levels are also indicative of anovulation and curcumin successfully restore the ovulation. The study suggests that the effects may be attributed to its multiple pharmacological activities like

DIRECTOR
Yashoda Technical Campus
Satara

1106

estrogenic, antihyperlipidemic, antioxidant and hypoglycemic effects which could be useful in managing PCOS condition and prevent ovarian cell dysfunction, ovulation and thereby improving fertility. The studies show that the effect of curcumin is similar to that of Clomiphene citrate[22].

Cocus nucifera (Coconut): The reported the effect of Cocus nucifera (Arecaceae) flowers in reducing the major multiple symptoms of Letrozole-induced PCOD in female rats. Antioxidant status (superoxide dismutase (SOD) and glutathione reductase (GSH)) of the uterus homogenate, lipid profile (total cholesterol (TC), high density lipoprotein (HDL), low density lipoprotein (LDL), and triglycerides (TG)) of the serum was determined. Weights of the uterus and ovaries were separately monitored. The characteristics of changes in the ovary were evaluated by histopathological studies. C. nucifera flower extract-treated groups showed increased uterus weight and estrus cyclicity which indicates the estrogenic effect. The improved ideal lipid profile, good antioxidant status, blood sugar level and histopathology results revealed the recovery from poly cystic ovaries. Histological findings of the treated groups indicated that the extract of C. nucifera may bring down the active levels of hormones, such as FSH and LH, to normal levels, and that may be the reason for the recovery from experimentally induced polycystic ovaries. This is further supported by the presence of methyl (9Z, 12Z)-9, 12-octadecadienoate which possesses anti-androgenic properties], in the GC-MS analysis of the extract. The GC-MS analysis of the aqueous alcoholic extract showed the presence of twenty-five volatile and semi volatile phytoconstituents. The presence of flavanoid (3, 5Dihydroxy-6-methyl-2, 3-dihydro-4Hpyran- 4-one), which is responsible for its hypoglycemic effects[16].

CONCLUSION

Polycystic ovarian syndrome (PCOS) is one of the common endocrine disorder in women of reproductive age. Various risk factors have been investigated in relation to PCOS, which including glucose intolerances, obesity and dyslipidemia. Although so many synthetic drugs are shown effective management, their number of side effects and high cost lead a way to seek plant based remedies for the treatment of PCOS. In this review summarize some important medicinal plants for the treatment of PCOS. It is medicinal plant help for improving and managing PCOD condition. These plants are improving hyperandrogenism, insulin sensitivity, improving fertility and improving menstrual cyclicity.

Abstract

Depression is a widespread psychiatric disorder affecting around 21% population of the world. It is fourth leading cause of disease trouble universal by ranked and it is expected to turn into the second most immobilizing disorder. Moreover, it is not easy to expect which patient will retort to whichever given treatment. At present obtainable antidepressant drugs are effective and harmless, but limitations range from a delayed start of action to a considerable rate of non-responders. In the systems of traditional medicine, numerous plants and formulations have been used to take care of depression for thousands of years. The presently using drugs can impose a variety of side effects including cardiac toxicity, hypopiesia, sexual dysfunction, body weight gain and sleep disorder. During the last decade, there is a growing interest in the therapeutic effects of natural products on mental disorders.

***Keywords**: - Depression, Neurotransmitters, Antidepressant drugs, Mechanism, Pathophysiology, Medicinal plants*

INTRODUCTION

Depression is a chronic mental disorder that causes changes in mood, thoughts, behavior and physical health. It's a common but serious disease that can take away a person's ability to enjoy life and cause decline in capacity to undertake even the simplest daily tasks (1). Other than its chronic nature, symptoms associated with this mental disorder are often recurring and life threatening. According to the World Health Organization (WHO) unipolar depression is one of the leading causes of disability-adjusted life year (DALY) and approximately 350 people worldwide are

said to suffer from this mental disorder (2). As described in the Diagnostic and Statistical Manual of Mental Disorders, 5th edition (DSM- V) , the hallmark of major depressive disorder (MDD) is the occurrence of depressed mood (dysphoria) and loss of interest in activities that were rather pleasurable in the past (anhedonia) for a duration of at least two weeks (3). These symptoms must also be accompanied by at least four of the following manifestations such as changes in appetite or weight, sleep patterns, altered psychomotor activity, feelings of worthlessness or guilt, difficulty concentrating or making decisions and recurrent thoughts of death or suicidal ideation (4). Even though there are plenty of drugs developed for the management of depression, one of the challenges in dealing with this disease is that a significant portion of the patients taking antidepressants fail to attain full remission (5). Some patients also develop treatment resistant depression in which the patients fail to respond to the available drugs or other therapeutic approaches.

DEPRESSION

Definition

Depression is a chronic mental disorder that causes changes in mood, thoughts, behavior, and physical health (6). It's a serious but common disease that cans away a person's ability to enjoy life and cause decline in capacity to undertake even the simplest daily tasks (7).

Symptoms

1. Feelings of unhappiness or sadness
2. Loss of pleasure in normal activities or interest
3. Frustration or irritability
4. Excessive sleeping or insomnia
5. Changes in appetite
6. Reduced sex drive
7. Restlessness or agitation
8. Slowed speaking, thinking or body movements
9. Tiredness, loss of energy, fatigue
10. Frequent thoughts of death, suicide or dying

Types of depression

1. Major depressive disorder

Major depressive disorder is also known as unipolar depression. In this type of disorder of depression typically show anhedonia and dysphoric mood followed by physical changes in such as enhanced or reduced appetite, weight gain or loss, sleep alteration in pattern and sustained fatigue (8). Disturb in executive and cognitive functions are also demonstration by coherent thinking and lack of

DIRECTOR
Yashoda Technical Campus

concentrations as well as morbid brooding by thoughts of suicide and death (9).

2. Dysthymic Disorder

Dysthymic disorder is known as persistent depressive disorder (10). Patients display sadness or depressed mood that persists for the majority of the duration of the day for a minimum of two years in one year in adolescents and adolescents and adult. Majority of the major depressive disorder patients do not meet the full criteria of as there is interruption by remission of shorts periods (11).

3. Melancholic Depression

There is an almost absolute lack of ability to experience pleasure in all or almost everything. Morning mood is a worst and apparent in the psychomotor retardation is in this patients of subset (12). This type of depression is seen major frequently in the aged, in patient with psychotic depression and more severe form of depression (13).

4. Seasonal Affective Disorder

Seasonal affective disorder is depression type that's related to changes in seasons. This type of depression described as recrudesces by the year early winter or during fall (14). This seasonal affective disorder is characterized by feelings of guilt, low mood, increased irritability and worthlessness, shared symptom with other depressive disorder (15). Patients show a significant carving for foods high in carbohydrates and increased in appetite which results in obesity (weight gain).

5. Post-Partum Depression

Post partum depression is described group of heterogeneous depressive symptoms that have an effect on mothers (16). These symptoms may outward after or before giving birth. Half of the "postpartum" episode starts before the delivery time. Thus, are assigned to inclusively as "peri-partum" episodes (17). According to DSM-V anxiety and mood swings symptoms during pregnancy.

6. Psychotic Depression

Psychotic depression is depressive disorder is describe which is accompanied and very severe and psychotic symptoms. It is seen commonly as a combination of depression and psychosis that is not distinct into more of the two (18). It includes the symptoms of psychotic features such as delusions or hallucinations. Other than that its severe psychotic depression is related with poor response, prolonged course to higher relapse rate and available drugs (19).

DIRECTOR
Yashoda Technical Campus

 © MANTECH PUBLICATIONS 2020. All Rights Reserved

EPIDEMIOLOGY OF DEPRESSION

Depression is a large universal burden of disease and affects people in all communities across the world and 450 million people experience from several type of behavioral and mental disorder (20). The one year currency of depression is 4-8% and the lifetime currency for major depression as 14-17%. The lifetime currency rates of depression among men are 5-12% and women are 10-25%.

Moreover, bipolar disorder and major depression were associated with three fold increased risk of premature mortality as compared to general population.

The prevalence of depression in children is low and then increases in all the way through adolescence with a one-year prevalence of 4-5% in intermediate to late juvenescence (21). Depression is large risk aspect for suicide observed in adolescents; it's one of the main causes of death in this age group (22). Depression also leads to educational impairments and serious social and associated with substance abuse, increased rate of smoking, obesity.

ANTIDEPRESSANT DRUG

1) ***Selective serotonin re-uptake inhibitors (SSRIs)***
   e.g - Fluoxetine
   Citalopram

2) ***Serotonin and norepinephrine re-uptake inhibitors (SNRIs)***
   e.g - Amoxapine
   Desipramine

3) ***Monoamine oxidase inhibitors (MAOIs)***
   e.g - Clorglyline

4) ***Tricyclic antidepressants (TCAs)***
   e.g - Imipramine

5) ***Tetracyclic antidepressants***
   e.g - Amoxapine
   Desipramine

6) ***Serotonin receptor modulators (SRMs)***
   e.g - Trazodone

ANTIDEPRESSANT MECHANISMS

Neurotransmitters are endogenic chemicals that communicate signals covering a synapse from one neuron to another 'target' neuron. Brain neurotransmitters competency not be secreted in sufficient amounts to relieve disorders of mood (23). The chemicals like melatonin, dopamine and serotonin are the most essential in brain for sense. Onetime the nerves are robbed of those neurotransmitters, they

YASHODA TECHNICAL CAMPUS 6757
DIRECTOR
Yashoda Technical Campus

can't send messages to different nerves which leads to depression (24). The messages that are passed direct the neurons are exhibited as behavior, emotions, appetite, temperature, or several alternative functions. Low levels of norepinephrine and serotonin within the conjugation area leads to depression (25). Hence, antidepressant like medicine used to treat this works by enhancing the number of restricted neurotransmitter in that specific part of the brain which authorizes to transfer the message (26).

All type of antidepressant works at brain among small differences, all antidepressant medicine affect the neurotransmitters how to work within the brain, mainly norepinephrine and serotonin, thus manage the balance of the neurotransmitters.

Selective serotonin reuptake inhibitors have different mechanism of action. SSRI has three different serotonin reuptake inhibitors those are paroxetine, sertraline and fluoxetine (27). These have selective effect for both fluvoxamine and citalopram on the serotonin reuptake pump. It leads to primary enhance in serotonin at the cell body and dendrites (28). So, SSRLs act by blocking the serotonin reuptake pump (5-HTT).

Serotonin norepinephrine reuptake inhibitors SNRIs block both norepinephrine transporter (NET) and 5-HTT. Blocking those transporters prohibit the neuron from vaccuming up extreme neurotransmitters, granting a lot of to stick in the synapse and excite postsynaptic receptors (29).

Monoamine oxidase inhibitors (MAOIs) MAOIs aren't retake blockers as all they enhance neurotransmitter amount by inhibiting monoamine oxidase (MAO), relate enzyme that breaks down all 3 monoamine like dopamine, serotonin, and monoamine neurotransmitter (30). Thus, MAOIs enhance the level of all 3 neurotransmitters thought critical in depression; these are adequacy advantage by others (31).

Tetracyclic and Tricyclic antidepressant alleviate depression by affecting naturally happen chemical messengers (32). Cyclic antidepressants generally block the results of 2 neurotransmitters known as norepinephrine and serotonin these are accessible in the brain. This looks to assist brain cells receive and send messages (33). The roles of these chemicals have treat the depression.

YASHODA TECHNICAL CAMPUS 6757
DIRECTOR
Yashoda Technical Campus

Serotonin receptor modulators are used in the treatment of irritable intestine syndrome. Serotonin plays a important role in the humour reflexes and initiation of peristaltic, and in alteration of visceral sensations.

Lithium utilized for manic depression. Manic depressive patient's ability serious mood changes, starting from frenzied state to sadness or depression relate degree excited.

NEUROTRANSMITTER SYSTEM

The adrenaline, noradrenaline, dopamine, catecholamine from the adrenergic system in the Central Nervous System. Some of these adrenergic neurons discharge catecholamines in to the frontal cortex and radiate from the ancient limbic system (emotional centres) (2). The catecholaminergic pathways are responsible for mood stress (flight or fight), alertness responses. Serotonin is the main neurotransmitter regulates the excitatory catecholamine system of the Central Nervous System. Serotonin neurons are important as the control of mood, appetite, sex drive, memory (34).

The noradrenaline and serotonin system have their most important cell bodies in small region of the brain stem that serve as headquarters for sending axonal projections throughout the brain in specific pathways that mediate specific functions (35). Multiple noradrenergic and serotonergic pathways may be dysfunctional in depression generating many different symptoms.

The projection of the serotonin system arises from the nuclei of the raphe magnus and dorsal raphe. The serotonin receptors (5-HT) have been identified into various sub-types with 5-HT1 and 5-HT2 sub types being of greater interest in psychiatry. Subclass is 5-HT1A which is concentrated in hippocampus and raphe. These receptors are implicated as autoreceptor that modulate 5-HT release from presynaptic neurons. The 5-HT2 receptor occurs in high concentration in the nucleus accumbens and frontal cortex.

HYPOTHESIS OF DEPRESSION

Several hypotheses of the biological determinants of depression have emerged over the most important of these and the implications therefore are reviewed below. Today it is generally accepted that depression is not necessarily due to a shortage of one vital brain neurotransmitter, but rather to a disruption in the equilibrium between different regulatory systems

DIRECTOR
Yashoda Technical Campus

 © MANTECH PUBLICATIONS 2020. All Rights Reserved

1. The monoaminergic hypothesis of depression

This hypothesis has develop to contemplate the prospect that depression can be the result of a inadequacy in signal transduction against the monoamine neurotransmitter to its postsynaptic neuron, even with normal levels of receptor and neurotransmitter being present (3). The monoaminergic hypothesis of depression accept that the major symptoms of depression are the result of inadequate concentration of serotonin (5-HT) and noradrenaline (NA) in the synaptic clefts related to neurons in the brain (36). Emerging theories that link environmental and genetic and risk factors for depression by resulting in less key gene products, down regulating certain genes, such as brain derived neurotrophic factor (BNDF), being produced. So if the encoding gene is repressed the result may be atrophy or even apoptosis of neurons (37).

2. The dopamine hypothesis of depression

The original hypothesis was formulated in the late nineteen seventies by Solomon snyder and linked schizophrenia with dopamine (DA) activity (38). Later this hypothesis was extended to include depression following the observation that many antidepressants influence the metabolism of dopamine following chronic antidepressant treatment, the presynaptic DA receptors become subsensitised and this result in an increase in DA release (39). A decrease in homovanllinic acid (HVA), the main metabolite of dopamine, in the cerebral spinal fluid (CSF) of decreased patients who demonstrate marked motor retardation has also been reported (40). Therefore, a reduced in the ratio of HVA to DA is indicative of decreased turnover of DA (41). This hypothesis is also supported by reports of significantly reduced dopamine turnover in depressed suicide victims (42).

3. The permissive hypothesis of depression

This hypothesis emphasizes 5HT as a neuromodulator and its importance as a target for antidepressant action. According to this theory, a lowered concentration within the Central Nervous System (CNS) of 5-HT results in an affective state regulated by NA (43). Decreased NA and 5-HT levels will give rise to depression. This means that 5-HT can act as a permissive modulator of neurotransmitter functions through connections between serotonergic pathways and make connections with dopaminergic and

DIRECTOR
Yashoda Technical Campus

noradrenergic pathways via the associated receptors (44).

4. ***The glutamatergic N-methyl –D-aspartate hypothesis***

Current discovery specify that the affliction of CNS glutamatergic pathways can play a role as in mechanism involved in depression (45). Several studies have independently confirmed that compounds which reduce activity at the NMDA receptors produce similar effects to clinically active antidepressants. It is therefore hypothesized that adaptive changes in the NMDA receptor complex could be a common pathway affected by all antidepressants (46).

MEDICINAL PLANTS USED IN DEPRESSION

Medicinal plants throughout the world have been utilized to treat disorders of the body and the brain since antiquity. Herbal medicine has been a proper alternative for the management of mental disorder such as depression, anxiety, and dementia between plenty others. Discovering antidepressants from herbal sources appear to be proper approach due to their lower prevalence of side effects and therapeutic efficacy (47). Hyperforin and hypericin are flavonoids present in hypericum that are claimed to be important for the antidepressant activity of the plant.

Medicinal plants largest universally used to treatment of depression throught the world are *Centella asiatica, Hypericum perforatum, Rauwolfia serpentina, Pfaffia paniculata, Schizandra chin, Rhododendron molle, Thea sinensis, Valeriana officinalis, Uncaria tome, Withania somnifera.*

There is a long history of using plants for treating different diseases in Ethiopia. This herbal based therapy is high valued and has passed from one generation to another generation by word of mouth. Herbal therapy closed continues to be the first preference treatment option for nearly 80% of the population. Plants such as *Whitiana somnifera, Justica odora, Calpurnia aurea and Aspargus leptocladodius* have traditionally been used for depression treatment (48).

1. ***Clitoria ternatea***

Mood disorders are one of the major common mental sicknesses with a lifetime risk of 10% in the widespread population. Most of the drugs that are currently being used within the treatment of depression adversely influence the quality of life of the patients. This leads to patient's non-

YASHODA TECHNICAL CAMPUS 6757
DIRECTOR
Yashoda Technical Campus

compliance with medication, which further complicates the problem.

In the present study, clitoria ternatea (150 and 300 mg/kg) produced significant dose dependent antidepressant effect in behavioral despair tests. The plant clitoria ternatea contains tannin; the antidepressant activity may be due to MAO inhibition, thereby enhancing norepinephrine and dopamine levels in the brain (11).

2. Zingiber officinale

Ayurveda mentions a number of single and compound drug formulations of plant origin that are used within the treatment of psychiatric disorders and are claimed to have a better side-effect profile than conventional drugs.

Zingiber officinale (150 and 300 mg/kg) significantly ($p<0.001$) and dose dependently decreased the immobility time as compared to group of control mice. Thus, the activity of zingiber officinale could involve particular mechanisms of the established agents as described above.

As medicinal plants possess their importance considering ancient time, people are using it from different ways by medicine source. From the highly beneficial animal study, we achieve that the plant extract zingiber officinale show a significant antidepressant activity in TST and FST models of depression (20).

3. Magnolia officinalis

Magnolia officinalis, M. dealbata, M. grandiflora, M. obovata and are the plants from family Magnoliacea which are used to treatment of neurological diseases such as depression, convulsion, seizure, and anxiety and as sedative and painkiller.

Magnolol and honokiol are two main compounds identified in these plants. These compounds came to be reported to cause antidepressant effects through affecting serotonergic system investigated the effect of the oral use of such two compounds at mild chronic stress induced depression. Mild chronic stress caused reduced in 5-HT and its metabolite, 5-HIAA, in different parts of the brain and abolish the activity of platelets adenylyl cyclase.

These two compounds caused the changed value of adenylyl cyclase, 5-HIAA, 5-HT, and corticosterone to return to baseline levels. The antidepressant effects of honokiol and magnolol in this study were assign to the improvement of the induced disturbance in HPA axis, AC-cAMP pathway, serotonergic system (49).

DIRECTOR
Yashoda Technical Campus

4. Hypericum perforatum

In the current years, H. perforatum has exist competing for being commercially accessible as an antidepressant and for this reason some studies have been manage to discover the chemical compounds responsible for this effect and their action mechanisms. Biochemicals investigations possess determine that H. perforatum is a weak inhibitor of monoamine oxidase but inhibits synaptosomal restoration of dopamine, serotonin, and norepinephrine. H. perforatum extract exerts down-regulatory effect on beta-adrenergic receptors and up-regulatory result on serotonin receptors, and changes the neurotransmitters concentrations in definite regions of the brain.

The antidepressant effects of H. perforatum certain compounds like as Hyperforin, hypericin, and isoquercetin have been demonstrated (50).

5. Rosmarinus officinalis L.

R. officinalis is from family Labiatae and has numerous pharmacological effects including ant diabetic, antibacterial, and anti-oxidant, hepatoprotective, anticoagulant, antiulcer, diuretic and anti-inflammatory. An experimental study showed that hydroalcoholic R. officinalis extract (100 mg/kg) with treatment significantly reduced immobility duration in suspension in mice and forced swim test. Pretreatment with pchlorophenylalanine (serotonin synthesis inhibitor), NAN-190 (receptor antagonist 5-HT1A), ketanserin (receptor antagonist 5-HT2A), mCPBG (antagonist receptor 5-HT3), prazosin (1 adrenoreceptor antagonist), SCH23390 (D1 dopamine receptor antagonist), and sulpiride (D2 dopamine receptor antagonist) inhibited the antidepressant effects of R. officinalis extract (49).

6. Passiflora foetida

At the basis of the clinical association of stressful life events and depressive episodes, many of the animal models for the antidepressant evaluation of drug activity evaluate stress –precipitated behaviors. Harmaline alkaloids present in p.foetida doing by reversible monoamine oxidase inhibitors and in common with other beta caroline binds to HT (5-hydroxy tryptamine) receptors. MAO regulates the metabolic degradation of catecholamines, serotonin and other endogenous amine in central nervous system. Inhibition of this enzyme causes a reduction in metabolism and subsequent increase in the concentration of biogenic amines. Also the flavonoid components of MERF might be interacting with adrenergic and

DIRECTOR
Yashoda Technical Campus

serotonergic systems in mediating the antidepressant effects of MERF (51).

CONCLUSION

Depression is an incapacitating disease which needs appropriate treatment. This presentation reviews the pharmacology of antidepressant drugs and the future perspectives of treating mood disorders such as depression. The foremost theory for explaining the biological basis of depression has been the monoamine hypothesis. Depression is due to a deficiency in one or other biogenic monoamines (serotonin, 5-HT; noradrenaline, NA; dopamine, DA). Antidepressant drugs are therefore classified according to their ability to improve monoaminergic transmission. Since this first theory, other explanations based on abnormal function of monoamine receptors or associated with impaired signaling pathways have been suggested. Notable progress has been accomplished in the treatment of major depressive disorders with new compounds recently discovered (selective serotonin reuptake inhibitors: SSRI; serotonin noradrenaline reuptake inhibitors: SNRI). Behavioral, electrophysiological and micro dialysis studies have shown that serotonin (5-HT) receptors exert a key role in modulating antidepressant activity.

Abstract

Peptic ulcer disease is one of the common gastrointestinal disorders. The conventional drugs used in the treatment of ulcers include histamine receptor antagonists, prostaglandin analogues, proton pump inhibitors, cytoprotective agents, antacids and anticholinergics. Hence, herbal medicines are generally used in such chronic cases, wherein drugs are required to be used for long periods. A number of screening methods are used for evaluating antiulcer activity, such as pylorus ligation in rats, Stress ulcer through immobilization stress, Stress ulcers by cold water immersion, Indomethacin induced ulcers in rats and ethanol-induced mucosal damage in rats. In this review number of herbal remedies has mentioned as they have minimum side effects and a greater margin of safety.

***Keywords**: - Prostaglandin analogues, Proton pump inhibitors, Zollinger-Ellison syndrome, Ulcer index, Immobilization stress, Cytoprotectives etc.*

INTRODUCTION

Peptic ulcer disease is a serious GI disorder. These ulcers can develop when the imbalance occurs between the gastro-protectives (mucus, bicarbonate and prostaglandins) and aggressive (acid, pepsin, bile salt and Helicobacter pylori bacteria). Here are major factors that cause peptic ulcers like infection with gram-negative Helicobacter pylori, increased hydrochloric acid secretion, inadequate mucosal defense against gastric acid, drugs, such as cholinergic drugs, NSAIDs, improper food intake. Peptic ulcer disease is one of the common gastrointestinal disorders in clinical practice. The common forms of peptic ulcer are duodenal ulcer, gastric ulcer; NSAIDs induced ulcer and

Satara

Page 1-11 © MANTECH PUBLICATIONS 2020. All Rights Reserved

stress ulcer. Among these, the duodenal ulcer is more common in adult males. A gastric ulcer occurs commonly at old age and a lower socio-economic class of individuals. The current approach to the peptic ulcer is managed by inhibition of gastric acid secretion, blocking apoptosis, promotion of gastro-protection, and stimulation of epithelial cell proliferation for effective healing. The conventional drugs used in the treatment of ulcers include histamine receptor antagonists, prostaglandin analogues, proton pump inhibitors, cytoprotective agents, antacids and anticholinergics, but most of these drugs produce undesirable side effects or drug interactions and may even alter biochemical mechanisms of the body upon chronic uses. Hence, herbal medicines are generally used in such chronic cases, wherein drugs are required to be used for long periods. (Hamilton & Rege, 2004), (Milosavljevic, Kostić-Milosavljević, Jovanović, & Krstić, 2011)

CHANGES IN LIFESTYLE AND DIETARY

Aspirin and related drugs (non-steroidal anti-inflammatory drugs), alcohol, coffee (even decaf) and tea can interfere with the curing of the peptic ulcers. Smoking may also low the ulcer healing process. People with ulcer symptoms have been evaluated to have more carbohydrates than people with no ulcers, from this route may occur with a genetic susceptibility for the ulcer pathogenesis. Sugar has also been reported to increase stomach pH. Salt may cause stomach and intestine irritation. Large uptakes of salt have been linked to a higher risk of stomach ulcers. One of the amino acids known as Glutamine is the important energy source in cells that cover the stomach and intestine. It also prevents the stress ulcer related by large burns of the preliminary study about the pathogenesis of ulcers. (Fichna, 2017)

TYPES OF PEPTIC ULCER

1) Gastric ulcer
2) Duodenal ulcer

Gastric Ulcer

Gastric ulcers are usually single and less than 20 millimetre in diameters. Ulcers on the small curvature are mainly related to the chronic gastritis condition, whereas those in the larger curvature are often associated to the non-steroidal anti-inflammatory drugs effects Physiological factors in gastric ulcers: Gastric ulcers almost invariably arise in the setting of H. pylori gastritis or chemical gastritis that results in injury to the epithelium. Most patients with gastric ulcers secrete less

YASHODA TECHNICAL CAMPUS 6757
DIRECTOR
Yashoda Technical Campus
Satara

 © MANTECH PUBLICATIONS 2020. All Rights Reserved

acid than do those with duodenal ulcers and even less than normal persons.

The factors implicated include:

1) back-diffusion of acid into the mucosa,
2) Decreased parietal cell mass,
3) Abnormalities of the parietal cells themselves.

A minority of patients with gastric ulcers exhibit acid hypersecretion. In these persons, the ulcers are usually near the pylorus and are considered variants of duodenal ulcers. Interestingly, the intense gastric hypersecretion that occurs in the Zollinger-Ellison syndrome is associated with severe ulceration of the duodenum and even the jejunum but rarely with gastric ulcers. (نواس ال, 2016)

Duodenal Ulcer

Duodenal ulcers are ordinarily located on the walls of the duodenum, at a short distance from the pylorus region. Physiological factors in duodenal ulcers: The maximal capacity for acid production by the stomach reflects total parietal cell mass. Both parietal cell mass and maximal acid secretion are increased up to twofold in patients with duodenal ulcers. However, there is a large overlap with normal values and only one-third of these patients secrete excess acid. Accelerated gastric emptying, a condition that might lead to excessive acidification of the duodenum, has been noted in patients with duodenal ulcers. However, as with other factors, there is substantial overlap with normal rates. Normally, acidification of the duodenal bulb inhibits further gastric emptying. The pH of the duodenal bulb reflects the balance between the delivery of gastric juice and its neutralization by biliary, pancreatic and duodenal secretions. The production of duodenal ulcers requires an acidic pH in the bulb, that is, an excess of acid over neutralizing secretions. (BOCK & KELLEY, 1949)

Symptoms of Peptic Ulcers

- Changes in appetite
- Nausea
- Bloody or dark stools (melena)
- Unexplained weight loss
- Indigestion
- Vomiting

SCREENING METHODS FOR ANTIULCER ACTIVITY

1) Pylorus Ligation in Rat (SHAY rat)

This model is a simple and convenient method for the induction of gastric ulceration in the rat through ligature in the pylorus region; the ulceration is affected by the accumulation of acidic juice inside

DIRECTOR
Yashoda Technical Campus

 © MANTECH PUBLICATIONS 2020. All Rights Reserved

the stomach. Ulcer index & pH of gastric content of treated animals are compared with control groups. Different cumulative group administration, followed by dose-response curves establishment for ulcer formation, can be measured in these methods. Procedure: Female Wistar rats weighing 150-170 g are starved for 48 hours having access to drinking water ad libitum. During this time, they are housed singly in cages to prevent coprophagy. Six animals are used per dose and as control groups. Under mild ether anaesthesia an incision is made at the abdominal midline. The pylorus is closed by using small nylon. Higher supervision is required to avoid the damage of blood vessels inside the pylorus region. Grasping the stomach with instruments is to be meticulously avoided; else, ulceration will invariably develop at such points. The abdominal walls are sutured through the surgical procedure. The test samples are administrated through oral ingestion or injected subcutaneous route. The animals are placed for 19 hours in a suitable plastic container. Afterward, these animals are sacrificed in CO2 anaesthesia. The abdomen is re-ligated and a ligature is placed above the esophagus region and closer to the diaphragm area. The stomach is replaced with a watch glass and the materials are collected into a centrifugal tube. Above the longer curvature, the stomach fully opened and pinned between cork plates. The mucosal layer is observed with the help of a stereomicroscope. (Bae et al., 2011)

2) Stress Ulcer through Immobilization Stress

Psychogenic factors, such as stress, produce a major role in the etiology of gastric ulcers in human beings and animals. Hence not only antacids ingestion, anticholinergics, H2–antagonists, proton pump inhibitors treatment, and also psychotropic agents such as neuroleptics have also effective for the treatment.

Procedure: Groups of 6 female Wister rats per dose of test drug and for controls weighing 150-170 g are used. Food and water are removed 24 hours before the experimental procedure. After oral or subcutaneous ingestion of the test substance or the placebo drug in animal's extremities is fixed combine and the animals are tied in wire gauze. These animals are horizontally suspended in a dark room at 20oC for one day and the last animals are sacrificed in the CO2 anaesthesia method. The stomach has been cut, fixed in a cork plate and the count and scores the severity of ulcers with the help

DIRECTOR
Yashoda Technical Campus

of video recorded stereo-microscope. (نواس ال, 2016)

3) Stress ulcers by Cold Water Immersion

Coldwater treatment of rats during the restraint duration boosts the appearance of gastric ulcers and reduces the time necessary immobilization process. Procedure: In this experiment, groups of 8-10 Wistar rats weighing 150-200 g were used. After oral administration of the test compound, the rats have placed vertically individual restraint cages in the water at 22oC for 1 hour. These were removed, allowed to dry and inject Evans blue (30mg/Kg) intravenously through the tail vein. After ten minutes, these animals are sacrificed by CO2 anesthesia; stomachs were collected in Formol - saline (2%v/v) overnight storage for about 24 hours. After that, the stomachs are opened the greater curvature, washed via warm water and examined through a 3-fold magnifier. (Ito, Shichijo, & Sekine, 1993), (Goulart et al., 2005)

4) Indomethacin Induced Ulcers in Rats

Nonsteroidal anti-inflammatory agents, like indomethacin and acetyl-salicylic acid, produce gastric lesions in human beings and rodents by the inhibition of gastric cyclo-oxygenase leading to the formation of prostacyclin. Procedure: Groups of 5-6 Wistar rats weighing 150 - 200 g are used. The test drugs are administered orally in 0.1 % tween 80 solutions 10 minutes before the oral indomethacin at a dose of about 20 mg/kg (4 mg/ml dissolved in 0.1 % tween 80 solutions). Six hours later, the rats are euthanatized through CO2 anaesthesia; these animals stomach was removed and inject with Formol-saline (2%v/v) for storage about one day. After that, the stomachs are opened the greater curvature, washed via warm water and examined through a 3-fold magnifier. (Bozkurt et al., 2017)

5) Ethanol Induced Mucosal Damage in Rats

(Cytoprotective activity) The intragastric application of absolute ethanol is a reproducible method to produce gastric lesions in experimental animals. The lesions may be blocked by some drugs (ex:- prostaglandins). These protective activity opposites to the irritants are known as a cytoprotective activity. Procedure: Male Wistar rats weighing 250 - 300 g are deprived of food 18 hours prior to the experiment but are allowed free access to water. During this time, they are kept in restraining cages to prevent

TECHNICAL CAMPUS 6757
DIRECTOR
Yashoda Technical Campus

coprophagy. The rats are administered either are appropriate vehicle or cytoprotective drugs, for example, a prostanoid, intragastrically 30 minutes prior to administration of 1 ml absolute ethanol. Untreated animals are included as controls. One hour after administration of ethanol, the animals are sacrificed in CO2 anaesthesia and their stomachs exercised, cut along the greater curvature and gently rinsed under tap water. The stomachs are stretched on a piece of foam core mat, mucosal site up. The subjective scores of the treated tissues are recorded.(Sahoo et al., 2016)

NATURAL REMEDIES

Bari Ilayachi (Elettaria cardamomum and Amomum subulatum)

Both drugs have a gastroprotective effect may be due to a decrease in gastric motility. They cause relaxation of circular muscles, which may protect gastric mucosa through flattening of the folds. This will increase the mucosal area exposed to narcotizing agents and release the volume of gastric agents on the rugal crest. Such action has been postulated to play a role in the cytoprotective effect of prostaglandins. (Jamal, Javed, Aslam, & Jafri, 2006)

Black berry

One of the most interesting substances that have been obtained from chili peppers and present in spicy plants such as ginger or black pepper is capsaicin. This substance acts on sensory neurons to stimulate their membrane receptors, principally vanilloid (VR)-1 receptors, and free various kinins such as substance P. When applied in a large dose; capsaicin destroys selectively C-fiber neuronal endings leading to inactivation of sensory nerves and the loss of all reflexes in which these nerves are involved. In a lesser dose, capsaicin is a potent gastroprotective agent and a stimulant of gastric microcirculation. (Sangiovanni et al., 2013)

Chamomile (Matricaria recutita)

Chamomile is a herb that has been used traditionally as a mild sedative to relieve anxiety and in treating digestive disorders, including peptic ulcers. Chamomile also may be effective in relieving inflamed or irritated mucous membranes of the digestive tract and in promoting digestion. Chamomile has a soothing action on the digestive system. Its gentle, soothing action is beneficial in digestive disorders like indigestion, acidity and peptic ulcers. It is also rich in the flavonoid apigenin-another flavonoid that inhibits the growth of H. pylori. (Jabri et al., 2017)

6757 YASHODA TECHNICAL CAMPUS
DIRECTOR
Yashoda Technical Campus

Dong quai (Angelica sinensis)

Animal studies recommend that dong Quai may relieve ulcers, but studies in people are needed before a definitive conclusion can be drawn. (Ye, So, Liu, Shin & Cho, 2003)

Licorice (Glycyrrhiza glabra)

Licorice root has a high background in the effect of soothing effect in the inflamed and damaged mucous membranes of the digestive tract. Licorice also protects the stomach and intestinal parts by increased production of mucin, which protects the lining of the HCl and other substances. According to Preclinical research, Flavonoids of licorice may also suppress the growth of H. Pylori.(Jamal et al., 2006)

Marshmallow Root (Althaea officinalis)

For decades, marshmallow has been used in folk medicine to help cure gastric ulcers. The roots of the marshmallow contain mucilage, a gelatinous substance found in plants. When it comes into contact with water, this mucilage swells, forming a soft, protective gel. This is believed to provide a protective barrier against irritating substances that may aggravate ulcers. (Zaghlool, Shehata, Abo-Seif, & Abd El-Latif, 2015)

Tea Root Extract (Camellia sinensis)

Tea root extract might primarily decrease the leakage of plasma proteins into the gastric juice with the strengthening of the mucosal barrier and increase its resistance to the damaging effect of ethanol-induced ulcer.(Maity, Vedasiromoni, & Ganguly, 1995)

Turmeric (Curcuma longa)

Some of the important constituents of Curcuma longa exert several protective effects on the gastrointestinal tract. Sodium curcumin, which is a salt of curcumin, inhibits intestinal spasm, and p-tolymethylcarbinol was found to be capable of increasing bicarbonate, gastrin, secretin, as well as pancreatic enzyme secretion. Turmeric also inhibits ulcer formation caused by stress, alcohol, indomethacin, pyloric ligation, and reserpine in rats. This study demonstrated turmeric extract significantly increased the gastric wall mucus in rats subjected to these gastrointestinal insults.(Rafatullah, Tariq, Al-Yahya, Mossa, & Ageel, 1990)

Antiulcer Activities of Bambusa Arundinacea

The anti-inflammatory activity shown by the methanol extract of Bambusa arundinacea is due to prostaglandins synthesis inhibition. One such possibility

is that the anti-inflammatory and antiulcer activity of the methanol extract may be due to the inhibition of PAF receptors. Significant anti-inflammatory activity was also noticed with the methanol extract on immunologically induced inflammation. The methanol extract also showed the significant antiulcer activity.(Muniappan & Sundararaj, 2006)

Anti-ulcer Activity in a Hydro- ethanolic Extract from Kielmeyera coriacea

To induce gastric ulcers in experimental animals the antiulcer activity of a hydro-ethanolic extract prepared from the stems of Kielmeyera coriacea Mart.(Guttiferae) was evaluated by using different models like ethanol-acid, acute stress and Indomethacin models. Treatment with K coriacea hydro-ethanolic extract provided considerable antiulcer protection in the ethanol-acid and Indomethacin models however it did not treat the acute stress model. These results concluded that the K coriacea hydro-ethanolic extract protect the gastric mucosa by increasing resistance to necrotizing agents. (Goulart et al., 2005)

Gastric Antiulcer and Anti-Inflammatory Activities of the Essentialoil from Casearia Sylvestris Sw

To explore the antiulcer and anti-inflammatory activities of the essential oil from Casearia sylvestris leaves (EOCS) the following tests were used: pylorus ligation test, rat paw edema, granulomatous tissue test, vascular permeability, writhing test, gastric ulcer stress-induced. The overall total yield of EOCS was 2.5% having a LD50 of 1100 mg/kg in mouse. Caryophyllene, thujopsene, alfa-humulene, beta-acoradiene, germacrene-d, bicyclogermacrene, calamenene, germacrene B, spathulenol and globulol are the major compounds identified using gas chromatography. The EOCS orally administered to the rats at 125 mg/kg given out 36% of inhibition in carrageenan-induced edema in the rat paw assay.($p < 0.05$, Student’s t-test). However, both rat paw edema dextran-induced and vascular permeability assayusing histamine showed no significant inhibition. Mice submitted to the writhing test using acetic acid presented 58% and 56% of inhibitionin writhes with EOCS and indomethacin, respectively. Furthermore, EOCS inhibited 90% of stress-induced gastric ulcer, while cimetidine inhibited 70% ($p < 0.05$, Student’s t-test). The volume of gastric secretion in the group treated with EOCS was greater than the group treated with cimetidine. With this it can be concluded that EOCS of Casearia sylvestris possess

anti-inflammatory and anti-ulcer activity. (Esteves et al., 2005)

CONCLUSION

A peptic ulcer is one of the serious gastrointestinal tract disorders characterized by severe damage to epithelial cells of the stomach characterized by GI bleeding. The number of allopathic medicines used nowadays is usually accompanied by side effects like nausea, vomiting, constipation, indigestion, heartburn, blood in vomiting etc. Hence, herbal medicines are generally used in such chronic cases; drugs are required to be used for long periods. Bari ilayachi, blackberry, curcuma amada, marshmallow root, liquorice root, curcuma longa are some of the herbal remedies that possess very good cytoprotective properties, increases bicarbonate ion and prostaglandin production and can be used for a long period of time.

ABSTRACT:
The maestro is the scientific leader in developing state-of-the-art chemical stimulation software for use in pharmaceutical, biotechnology, and, materials science research. Maestro is the portal to all of maestros computational technology-far more than just a user interface, Maestro also helps researches organize and analyz data. Maestro is the culmination of years of research and development. by working closely to be the user environment that is both intuitive and allows our users to get work done efficiently. The typical bacteria form a biofilm which barrier for antibiotics and other harmful substances. The capacity of phages to penetrate that. In the study, we showed that Galloflavin and Ellagic acid increased SIRT6 activity and decreased the expression of SIRT6 associated proteins involved in cancer development. Taken together, Galloflavin and Ellagic acid targeting SIRT6 activity may provide a new insight in the development of anti-cancer therapy. As cetuximab exhibits several anticancer mechanisms, in vivo studies are needed to explore and confirm the effects of combining osimertinib with cetuximab in the L858R/T790M/L792H-mutant pattern.

KEYWORDS: Molecular docking, drug discovery, Maestro software.

1. INTRODUCTION:
Computer-aided drug design uses computational approaches to discover, develop, and analyze drugs and similar biologically active molecules. The ligand-based computer-aided drug discovery (LB-CADD) approach involves the analysis of ligands known to interact with a target of interest. These methods use a set of reference structures collected from compounds known to interact with a target of interest and analyze their 2D or 3D structures. The basic objective of these methods is to predict the nature and strength of binding of given molecule a target. The program renders the rover in a 3D environment. The program features the jet Propulsion Laboratory testing facility. Spirit's landing site to explore. Data from the Spirit and Opportunity's landing site must be downloaded externally from the Maestro website and imported into the program [1-3].

REVIEW OF LITERATURE:
Wieslaw swietnicki and et al used Maestro software to check the in silico analysis of bacteriophage tail tubular suggests a putative sugar binding site and a catalytic mechanism. In silico analysis was performed on the structure of a base tailplate protein gp31 from *Klebsiella pneumonia* bacteriophage KP32 (PDB: 5MU4) which shows activity towards maltose but not trehalose. The first region clearly favored maltose during the docking phase while the second one allowed for the energetically-equivalent binding of trehalose [4].

Carmen Diez-Simon and et al used Maestro software to check the comparison of volatile trapping techniques for the comprehensive analysis of food flavourings by gas chromatography-mass spectrometry. Trapping volatiles is a convenient way to study aroma compounds but it is important to determine which volatile trapping method is most comprehensive in extracting the most relevant aroma components when investigating complex food products. Comprehensiveness and repeatability were compared and SBSE proved particularly suitable for extracting components such as polysulfides, pyrazines and terpene alcohols [5].

Jae Myung Park and et al used Maestro software to check the A dodecapeptide selected by phage display as a potential theranostic probe for colon cancers. The peptide probe maintained binding affinity even after serum incubation. For therapeutic applications, this peptide probe was conjugated to hematoporphyrin, a photosensitizer, which showed a significantly enhanced cellular uptake and high photodynamic effect to kill tumor cells [6].

K. Wan Yusof and et al used Maestro software to check the developing a UiTM (Perlis) web-based of building space management system: A preliminary study in locating a specified space/room area using open source GIS tool. The preliminary result of the study shows that the spaces and room areas in the building can be mapped out digitaly and it can also be made available to be accessed through the web for the resident of the university [7].

Iman Mirmazloum and et al used Maestro software to check the oxidative stress level and dehydrin gene expression pattern differentiate two contrasting cucumber F1 hybrids under high fertigation treatment. According to RT-qPCR transcript levels of several antioxidant enzymes genes (ascorbate peroxidase, glytathione reductase and glutathione peroxidase) were significantly higher in 'Joker' compared to 'Oitol'. Antioxidant capacity increased in both hybrids with strong characteristics differences favoring 'Oital' plants [8].

Minna Rahnasto-Rilla and et al used Maestro software to check the effects of galloflavin and ellagic acid on sirtuin 6 and its anti-tumorigenic activities. Ellagic acid increased the deacetylase activity of SIRT6 by up to 50-fold; it showed moderate inhibition of SIRT1-3. Galloflavin and ellagic acid showed anti-proliferative effects in Caco2. In this study, we showed that Galloflavin and Ellagic acid increased SIRT6 activity and decreased the expression of SIRT6 associated proteins involved in cancer development. Taken together, Galloflavin and Ellagic acid targeting SIRT6 activity may provide a new insight in the development ofanti-cancer therapy [9].

Susan M. Burden-Gulley and et al used Maestro software to check the A novel molecural diagnostic of glioblastomas: Detection of an extracellular fragment of protein tyrosine phosphate μ[1.2]. The activity of the receptors tyrosine kinase is normally kept in check by the opposing activity of RPTPs such as PTPμ, which are important regulstors of adhesion-dependent signals [10].
H. Bounouria and et al used Maestro software to check the study of heavy metal assessment in the gharb plain along sebou river (morocco) using k0-NAA method triga mark II research reactor. The Ko-mothod activation analysis (ko-NAA) was used in order to determine the concentration of major and trace elements in sediment samples collected from different sites in the Gharb plain aong the Sebou River (morocco). The comparison with other sussequent studies on Sebou River gives an idea about the temporal evolution of heavy metal contamination at national scale [11].

Prasad G. Jamkhande and et al used Maestro software to check the software based approaches for drug designing and development: A systemtic review on commonly used software and its applications. Drug Discovery includes drug designing and development, is a multifarious and expensive endeavor, where least number of drugs that pass the clinical trials makes it to market. Novel software based methods such as molecular modeling; structure-based drug design, structure-based virtual screening, ligand interaction and molecular dynamics are considered to be powerful tool for investigation of pharmacokinetics and pharmacodyanamic properties of drug, and structural activity relationship between ligand and its target [12].

Sejal P. Gandhi and et al used Maestro software to check the computational data og phytoconstituents from *Hibicus rosa-sinensis* on various anti-obesity targets. Molecur docking analysis of twenty two phytoconstitient from *rosa-sinensis*, against seven targets of obesity like pancreatic, hormones as ghrelin, leptin and protein as SCH1and MCH is detailed in this data article. Chemical structures of phytoconstituents were downloaded from PubChem[2][13].

Sabrin R.M. Ibrahim and et al used Maestro software to check the mangostanaxanthone VIIII, a new xanthone from *Garcinia mangostana* pericaps, α-amylase inhibitory activity, and molecular docking studies. The α-amylase inhibitory potential of the isolated metabolites was evaluated. The molecular docking study of the tested metabolites was estimated to shade up therational explanation of the α-amylaseinhibitory activity results [14].

Amin O. Elzupir and et al used Maestro software to check the inhibition of SARS-CoV-2 main protease $3CL^{pro}$ by means of α-ketoamideand pyridine-containing pharmaceuticals usingin silico molecular docking. This study report for the firsttime a compound that could be binding to ALA^{285}, the new residue reaulting from genetic modification of $3CL^{pro}$ of SARS-CoV-2 that hasincresed its catalytic activity 3, 6-fold compare with its predecessor $3CL^{pro}$ of SARA-CoV [15].

El-Sayed I. El-Desoky and et al Maestro software to check the synthesis, biological evaluation and *in silico* molecular docking of novel 1-hydroxy-naphthyl substituted heterocycles. Chalcone **3c**, naphtyl pyrazoline **6b** and hyadroxycoumarin **13** exhibited the higher activity as antioxidants. *In silico* molecular docking of pyrazoline **6b** endorsed its proper binding at the active site of the 2EX6 enzyme which explains its potent antibacterial activity in comparison with standard ampicillin [16].

Raveendra Melanvanki and et al used Maestro software to check the investigation of interaction between boronic acids and sugar: effect of structural change of sugars on binding affinity using steady state and time resolved fluorecencespectroscopy and molecular docking. Binding interactions of boronic acid derivatives viz. 2-Methylphenylboronic acid (B1) and 3-Methoxyphenylboronic acid (B2) withmono saccharides (arabinose, fructose and galactose) and (sucrose, lactose and maltose) in aqueous condition at pH 7.4 by means of fluorescence spectroscopy is reported in the present investigation [17].

Massound Amanlou and et al used Maestro software to check the anti-HCV anti-malaria agent, potential candidates to repurpose for coronavirus infection: Virtual screening, molecular docking, and molecular dynamics simulation study. Concurrent the viral entranceto the host cell, its antigen will exposure to antigen presentation cells (APC) and then identified by cytotoxic T lymphocytes (CTIs). But reducing the number of CD4and CD8 cells in COVID-19 patients prevents Tcell proliferation and activity [18].

Mohammed M. Matin and et al used Maestro software to check the novel mannopyranoside esters as sterol 14α-demethylase inhibitors: synthesis, PASS prediction, molecular docking, and pharmacokinetic studies. Te activity spectra analysis along with *in vitro* antimicrobial evaluation clearly indicated that those novel MDM estershad better antifungal activitites over antibacterial agents [19].

Andrea Barni and et al used Maestro software to check the Mini-factories for close-to-customer manufacturing of customized furniture: from concept to real demo. During demonstration, customers had the possibility to access the shop, configure their products and see them manufactured in quasi-real time. The promising results of the demonstration activity pave the way for further exploration of the proposed concept [20].

Shobana Sundar and et al used Maestro software to check the Molecular docking, molecular dynamics and MM/PBSA studies of FDA approved drugs for protein kinase a of Mycobacterium tuberculosis; application insights of drug repurposing. Tuberculosis (TB) is a deadly disease, and novel treatment strategies are required to combat it. Repurposing of existing Food and Drug Administration (FDA) approved drugs against Mycobacterium tuberculosis (Mtb) proteinscould be beneficial for TB treatment [21].

CONCLUSION:

After completion of review, it was found that the Meostro molecular docking softwear is very important for Insilico analysis of different pharmaceutical compounds, it aslo helps in determine the molecular interaction, Molecular binding.

This softwear also useful to check the pharmacological activity, therapeutic activities such as Anti tumorigenic activity, Anti HIV activity, Anti malarial activity ETC. After literature review it was seen that numbers of researchers suggest the Meostro softer used for molecular binding, molecular interaction and insilico analytical activity.

ABSTRACT:
In these review we explain all the detailed information about guassian software. Now a days the guassian very much beneficial in to computational chemistry for medicinal chemistry work by the various calculations. This is initially used bye the john poples. Guassiansoftware capable of predicting many properties and calculations of molecules and reaction. Molecular docking also done bye this software. Varios authors wordks on their subject by using this software. I shows interest into guassian because of this is very beneficial for calculations. In guassian varios mathematical equations are added and this will be feneficial or helpful to guide scientist.

KEYWORDS: Molecular docking, Drug Discovery, Guassion Software.

1. INTRODUCTION:

Guassian software is a general purpose computational chemistry software package. Guassian software initially started used in or relesed in 1970 by the scientist john pople. And the scientist john pople started his research group at the Carnegie Mellon University as guassian 70 then this continusly udtaed by them. the name of software originates from scientist pople's use of guassian orbitals to speed up the molecular electronics structure calculation opposed to using slater type of orbital then choice to 9 improve the the performace of the software on computating capacities of current computer hardware for hartee fock calculations. The current updated version of this is guassian 16. This is originally availble through quantum chemistry programme exchnage. it was later licensed out by the university carnegie mellon university ans since 1987 has been developed and licensed by the guassian.

Received on 07.11.2020 Modified on 20.11.2020
Accepted on 02.12.2020

DOI: 10.5958/0974-4150.2021.00015.8

Guassian:

Original author	**John poples**
Developers	Carnegie mellon university
Initial release	1970, 50 years
Stable release	Guassian 16/2017
Website	Www.guassian.com

We will use the guassian programme in windows environment. Guassian is capable of predicting many properties of molecules and reaction, including the following

- Molecular energies and structures
- Reaction pathway
- NMR properties
- Energies and structures of transition states
- Bond and reaction energies
- Vibrational frequecies
- Molecular orbital
- Atomic charges and electrostatic potential
- Multiple moments

Computation can be carried out on system in gas phase and in their ground state or in an excited state

Guassuian input files:

In this Guassian input files inclufdes several different sections.

- Link 0 commands- locate and name scratch files we will not use this option
- Route section- specify desired calculation type the

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

method basic sets and other options
- optional addition sections- additional input needed fo9r specific job type
- Title section- brief description of calculation.

JOB TYPES FOR GUASSIAN INPUT:
There are 3 key components to this specification
1. Job type
2. The method
3. Basic set.

Computer aided drug design:
Simply rational design is the inventive process of finding new medication based on biological target. The drugs are commonly organic small moleculesthats activates or inhibits function of biomolecules such like a protein. That is further give the therapeutic action to the patient. Basic in that isdrug design means the invole in molecules that complementry in shape and size of biomolecules. They bind with each other and form the bond. Drug design not relies on computer modelling. This type of modelling callled as computet aided drug design. Drug design depends on knowledge of 3D structures of biomolecules that is known as structural aided drug design. In addition to small molecules biopharmaceutical includes peptides ans especially therapeutic antibodies are incresingly important class of drug and computational method for improving affinity, selectivity and stability been developed.

Drug design also known as efforts to develop a new drug by molecular modification of lead compound for optimization of desired efferts and minimization of side effects.

Now a days structural based drug design is the growing, interative and powerful approaches includes the structural evaluation of target and drug discovery process it is time consuming and as well as cost cunsuming too developing ideas of new effects and potential drug lead molecule

MOLECULAR DOCKING:
Molecular docking is very useful and intresting beneficial to us docking means the attempt to find best matching between two molecules. Docking is the process in which prdedict the preffere orientation of one ligand when bound in an active site to form stable complex. Aim for the molecular docking is to achive an optimization conformation for both receptor and ligand and the relative orientation between protein and ligand such that free energy of overall system is minimized. successful dockingvmethod search high dimensional spaces effectively and use a scoring function that correctly ranks candidate docking. Importance of the molecular docking is that identification of the ligands, correct binding geometry, prediction of binding affinity. etc. therae are rigid docking is the part of molecular docking in that we studied about internal geometry of receptor and ligand. Another type of docking is flexible docking in that we studied about the enumaration on rotation of the one of the molecules is performed. There are various application of molecular docking like lower free energy structures, calculate differntial binding of ligands, library design, novo design, screening of side effects, specificity of potential drug etc [1-3].

REVIEW OF LITRETURE:
Molecular studies docking charge transfer excitation and wave function analyses valacuclovir a potential antiviral drug this study carried by author Fathima Rizwana and Christina susan abraham and software used is guassian 0.9 [4].

REVIEW ARTICLE

Review on Discovery Studio: An important Tool for Molecular Docking

Shravani S. Pawar*, Sachin H. Rohane
Department of Pharmacy, Yashoda Technical Campus, Wadhe, Satara 415003.
*Corresponding Author E-mail: **shravanipawar118@gmail.com**

ABSTRACT:
In this paper, an overview on discovery studio docking program for analyze and modeling molecular structure, sequence of relevance to life science researcher. This software covers the areas such as ligand design, structure-based design, macromolecule design and engineering, simulations, pharmacophore modeling, quantitative structure activity relationship (QSAR), ADME, predictive toxicity. Discovery Studio help to analyze activities such as anti-convulsant, anti-viral, antidepressant, antibacterial, anti-tubercular, anti-Alzheimer, anti-malarial, anti-cancer. This software gives better result correlation with in-view pharmacological activity. So, this is a helping tool for a researcher to minimize the time as well as cost of research activity and also gives better understanding to study ligand and receptor complex.

KEYWORDS: Drug Discovery, Molecular Docking, Discovery Studio software.

INTRODUCTION:

Computer-Aided drug design represents computational resources that used to facilitate the design and discovery of new therapeutic solutions. Molecular docking is widely used in CADD due to its reliable prediction properties and is one of the essential backbones of CADD. Molecular docking is a rapid and inexpensive technique in academics as well as in industrial settings. Molecular Docking is a technique to find best matching molecular structure by interaction between enzyme and ligand. It also analyses the orientation of one molecule with other into the binding site of a macromolecular target. Docking has a major role in virtual screening, drug discovery, bioremediation.

Discovery studio software is an agglomeration to transcript small molecules and macromolecule system. It is developed by Dassault Systemes BIOVIA (Accelrys). Discovery Studio is a single unified, graphical interface for advanced drug design and protein modeling research. This software provides bunch of viewers for display plots and graphical representation of data.

Review of literature:

Ana-Maria Udrea and et al use Discovery Studio software to check the potential of phenothiazine in Covid-19 infection. They found that data given by docking software is correlated with in vivo activity. The data found to be suitable and correct with in vivo activity.

Shiben Wang and et al synthesized the different series of 1,3,4-oxadiazole derivatives using discovery studio and the compound were studied gives best anticonvulsant activity. In silico studies were carried out to explore the binding interaction of the most active compound. They found the target compounds were related with in vivo and vitro activity.

Fatma Gur and et al studied the adverse effect of Atomoxetine which issubstitute for methylphenidate in the long-term treatment of ADHD. They conduct molecular docking study using Discovery Studio programs. The data found to be match with in vivo activity.

K. Sangeetha and et al use the discovery studio to check the antiviral activities of plant derived compounds against zika virus. By In silico studies, the software used for screening of various phytochemicals against Zika virus to identify new promising drug candidates. In this study, around 5550 phytochemicals retrieved from

6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

various databases were subjected for molecular docking in Discovery studio program.

Shi-Ben Wang and et al designed and synthesized the derivatives of coumarin and 3, 4-dihydroquinolinone. They found that compound check in the discovery studio software have best antidepressant activityand also exhibits good affinity for the 5-HT1A receptor. These findings can be useful in the design and synthesis of novel antidepressants.

Fathima Rizwana B and et al studied the molecular docking and binding structures on famciclovir and entecavir compound simulated from Discovery studio program. The geometric structures were optimizedand the band gap energies were calculated using software. Electrostatic Potential (ESP) maps identifies Negative and positive potential regions with help of software. Molecular docking studies confirmed the antiviral activity of the selected compounds.

Geethalakshmi Rajarathinam and et al uses discovery studio for docking of T. decandra with FabZ. They found that isolated flavonoid compound possess excellent anti-P. aeruginosa activity. The in-silico analysis of isolated compound shows possible action in a hypothetical way. The molecular docking of flavonoid was carried out using Discovery Studio.

Sugunadevi Sakkiah and et al developed 3D pharmacophore model based on the known inhibitors. This Pharmacophore model was generated using HYPOGEN algorithm in discovery studio program. From the molecular docking studies around 36 compounds were obtained based on consensus scoring function and selected as HSP90 inhibitors.

The aim of Ran Joo Choi and et al was to evaluate the anti-Alzheimer's disease activities of selected ginsenosides. They use the docking software to check thepotential of ginsenosides in the development of therapeutic agents for Alzheimer's disease. They predict binding energies of the ginsenosides with β-site amyloid and obtained result were corelated with in vitro activity.

Nafees Ahmed and et al use discovery studio for synthesis of tricyclic guanidine derivatives and biological evaluation against P. falciparum. The docking studies show that there is very strong correlation between in silico and in vitro results. Based on the data obtained by software, more potent inhibitor against P. falciparum can be designed. Docking was performed using DS program to understand the mechanism of inhibition and to identify pharmacophore required for anti-malarial activity.

Prashant Bhardwaj and et al uses DS program for identification of novel proteintargets for triclosan. They conduct the inverse virtual screening study for protein targets. A text mining study of triclosan was initially performed to find outinteraction in various biochemical processes.

Amer Hosny and et al use the software for development of a predictive model to identify potential HIV-1 attachment inhibitors. They performed the study in two phased computational process to identify useful compounds capable of binding to the protein for therapeutic purposes using the Discovery Studio docking and screening software.

Mohammad Heiat and et al conduct the study in docking program to analyze isolated ssDNA aptamers against angiotensin II. They found that the structural and sequential homology between aptamers can be considered as a sign of similar characteristics and Output PDB files were modified from RNA to DNA in the discovery studio visualizer software. The in-silico study was performed and uses to find aptameric fragments binding potency.

Sagir Yusuf Ismail and et al performed in-silico QSAR study of sulfur containing shikonin oxime derivatives. The docking study also carried out between this derivatives and target protein. This study provides an approach for the design of more potent anti-colon drug. The data found to be match and correct with anti-cancer agent for colon cancer.

Shola Elijah Adeniji and et al use discovery studio software to molecular docking evaluation of selected quinoline derivatives. Discovery Studio software was used to visualized and analyzed the docked results. They found that activity of quinoline derivatives checked in software exhibits as best anti-tubercular agents.

CONCLUSION:

This study paved better understanding of Discovery Studio software for viewing, sharing, analysing protein and small molecule data. The DS program provides applications covering areas including molecular mechanism, molecular dynamics, quantum mechanics. Software also have ability to perform hybrid QM/MM calculations. It employed for small molecule and macromolecule applications. The molecular properties can found by editing structures and performing calculations.

Efficiency of AUTODOCK: *Insilico* study of Pharmaceutical Drug Molecules

Uday M. Satpute*, Sachin H. Rohane
Department of Pharmacy, Yashoda Technical Campus, Satara - 415015, India.
*Corresponding Author E-mail: **udaysatpute650@gmail.com**

ABSTRACT:
In current situation lots of Molecular Docking Software are available in the market for *Insilico* study of pharmaceutical drug molecules, so that we have to choose most appropriate software. During literature survey it was found that AUTODOCK software was efficiently guided to as author's regarding mainly pharmacological activities such as Antidiabetic activity, Antimalarial activity, Antivirus activity, Anticancer activity, Anti mycobacterial tuberculosis activity, Antioxidant activity, Etc. After review it was analyse that the AUTODOCK and its Tools are more efficient to determine the synthesis techniques, spectral analysis, docking simulation, photochemical activities, therapeutic effects, toxicological studies.

KEYWORDS: Molecular docking, Drug discovery, Auto dock software.

INTRODUCTION:
In the field of molecular modeling, docking is a method which predicts the preferred orientation of one molecule to a second when bound to each other to form a stable complex. Knowledge of the preferred orientation in turn may be used to predict the strength of association or binding affinity between two molecules using, for example, scoring functionsThe associations between biologically relevant molecules such as proteins, peptides, nucleic acids, carbohydrates, and lipids play a central role in signal transduction. Furthermore, the relative orientation of the two interacting partners may affect the type of signal produced (e.g., agonism vs antagonism). Therefore, docking is useful for predicting both the strength and type of signal produced.

Molecular docking is one of the most frequently used methods in structure-based drug design, due to its ability to predict the binding-conformation of small molecule ligands to the appropriate target binding site. Characterisation of the binding behaviour plays an important role in rational design of drugs as well as to elucidate fundamental biochemical processes [1-3].

REVIEW OF LITERATURE:
Sukanta Kumar Pradhanand et al used the Autodock 4 softwear for conducting several studies and identifing several target sites which influence drug-resistant to M. tb strains. In this case, there is the interaction between the protein Arabinosyl transferase C and two existing drugs (Ethambutol and Isoniazid) and by calculating the binding affinity and mode of binding. Ethambutol formed the five modified molecules (Emb 1, Emb 2, Emb 3, Emb 4 and Emb 5). The Emb 1 and Emb 3 having binding affinity- 5.77Kcal/mol and -5.13Kcal/mol respectively that are potential inhibitors of Arabinosyl trasferase C in mycobacterium tuberculosis [4].

Mohammed Al bratty used the Autodock Vina softwear for studying the extent and types of binding interaction present in between HAS and Anti Hypertensive drug like telmisartan (TLM). HAS is responsible for binding and transportation of many exogeneous and endogeneous ligand including drug like telmisartan in binding interaction, the TLM significantly interacts with binding site-1 of HAS by forming strong Hydrogen with Glu292 and Lys195 residues that affects concentration of TLM at site of action and also affects on therapeutic effect [5].

Idhayadhulla Akabar and et al used Auto Dock Vina softwear for the molecular interaction study between target protein and ligands. This study more exposed the all inhibitor acquired the negative dock energy against

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

the target protein. In molecular docking investigation it was found that the natural coumarin analogue toddacoumaquinone shows the inhibitory activity with binding energy -7.8Kcal than other compound against main protease of SAR coronavirusin intricate with a-ketomide [6].

Ran Yu and et al used the AutoDockVina softwear in the current spread of noval coronavirus (SAR-CoV-2) situation to discover the Anti Viral drug. This softwear helps to screening the potential drug by molecular docking with structural protein and non-structuralprotein site of new coronavirus. The Ribavirin, remdesivir, chloroquine and luteolin are also studied, the luteoline is bind with high affinity to same site of the main protease of SARS – CoV-2 [7].

Fareeda Athar and et al used the AutoDock. 4.2. for molecular docking studies performed that all derivatives along with the standard inhibitor STX-0119 showed that binding energy released in direct binding with the SH2 domain of STAT3 was the highest for compound 5e (-9.91kcal/mol). In virtual screening, compound 5e was found to exhibit optimum competency in inhibiting STAT3 activity. Compound 5e decreased the activation of STAT3 as observed with Western blot. The compound 5e was identified as a potent antioxidant agent and STAT3 inhibitor and effective agent for cancer treatment [8].

Akinwunmi O. Adeoye and et al used AutoDock softer for Molecular docking and virtual screening to understand the mechanism of ligand binding and to identify potent calcium transporter inhibitors: This study also deals with the evaluation of inhibitory activity of secondary metabolites of ethylacetate partitioned-fraction of Adansoniadigitata stem bark extract on malaria-associated protein using in silico docking studies. Digitata stem bark extract were examined for their antiplasmodial activity. Digitata shows the binding energy ranging between -6.5kcal/mol and -7.1kcal/mol. Among the two chemical constituents, apigenin has the highest docking score along with the highest number of hydrogen bonds formed when compared to quercetin. The analysis results suggest that apigenin and quercetinare acts as an anti-malaria agent [9].

Mohammad Jakir Hosen and et al used the AutoDock Vina softwear for the screening of the drugs against RdRp of SARS-CoV-2. It has been found that RNA dependent RNA polymerase (RdRp) plays a crucial role in SARS-CoV-2 replication, and thus could be a potential drug target. This study revealed that Rifabutin, Rifapentine, Fidaxomicin, 7-methyl-guanosine-5′-triphosphate-5′-guanosine and Ivermectin have a potential inhibitory interaction with RdRp of SARS-CoV-2 and could be effective drugs for COVID-19 [10].

PrashamsaKoirala, Su HuiSeongand et al used the AutoDock 4.2 softwear for determined the molecular interaction of BACE1 with isolated terpenoids. The AutoDock 4.2 programme revealed that hydroxyl group of lupeol formed two hydrogen bonds with the ASP32 (catalytic aspartic residue) and SER35 residues of BACE1 with the binding energy of (−8.2kcal/mol), while the ketone group of lupenone did not form any hydrogen bonds with BACE1 giving evidence for less binding affinity. It predicted that the dependence of the inhibitory activity in the presence of hydroxyl group which has provided a new basis for BACE1 blockade [11].

A. Lakshmana Rao and et al used the AutoDock 4.2.6softwear. The docking procedure was applied on a set of designed ligands within the region of 2PRG active site using AutoDock 4.2.6 software. Based on the validations and hydrogen bond interactions of various substituents, they were considered for the evaluation. It was done to understand the kind of interactions that occurred between various substituted thiazolidine-2, 4-diones with 2PRG binding site region [12].

Lakshmana Rao ATMAKUR and et al used AutoDock softwear for In vitro anti-inflammatory activity was checked by human red blood cell (HRBC) membrane stabilization and protein denaturation. Using AutoDock, molecular docking studies were carried out to find out the best fit ligands. In molecular docking studies, compounds 4h and 4n exhibited higher binding affinity at PPARγ receptor protein and compound 4k exhibited higher binding affinity at COX-1 and COX-2 actives sites Compounds 4h and 4n exhibited higher binding affinity at PPARγ receptor protein and compound 4k exhibited higher binding affinity at COX isoenzymes' active sites in molecular docking studies. AutoDock 4.2.6 software was utilized to know the type of interactions of the designed 3D-structured thiazolidinediones with the 2PRG, 1EQG, and 1CX2 active site regions [13].

GanugapatiJayasreeand et al used AutoDock 4.0 for theDocking studies which are essential to understand the interaction between the protein and the ligands. In this case the crucial protein from Insuline receptor and ligands from Cinnamon. Docking studies are essential to understand the interaction between the protein and the ligands. In Autodock studies, the best pose was obtained with least energy value from which it can be hypothesized that these 2 compounds can be considered as potential activators of insulin receptor. After that the lab studies have to be performed to confirm the

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

properties of these 2 compounds. tubulin isotypes. This indicates that select triple-modified 4 –chloro thio colchicines derivatives representhig hlypromising novel cancer chemotherapeutics. All the poses generated by both programs were rescored using the Vina scoring function. The top binding pose of colchicine and the derivatives was predicted by the Vina scoring function for the α-βII. a model which produce the best result sin terms of pIC50 predictions. Active residues involving non-hydrophobic interactions with the ligand are also specified for each compound [14].

Sarfaraz Alamand et al used AutoDockVina software (Scripps Research Chandrajit Dohutia and et al used AutoDock 4.2 to identify the receptor protein PfATP6 was the common target of artemisinin and curcumin. It was initiated to assess the antimalarial activity of six curcumin derivatives based on their binding affinities and correlating the in silico docking outcome with in vitro antimalarial screening. A ligand library of thirty two Knoevenagel condensates of curcumin were designed and docked against PfATP6 protein and six compounds with the best binding scores were synthesized and screened for their antimalarial activity against the sensitive 3D7 strain of Plasmodium falciparum [15].

Adam Huczynski and et al used AutoDock Vina and DOCK 6.5 for In silico studies to predict binding modes of the 4-chloro thiocolchicine derivatives to different β Institute, La Jolla, CA, USA) for molecular docking studies to validate the LibDock score. The designed compounds are optimized and then use for docking experiments. The docking program takes the PDBQT file format of ligands and receptor, a modified PDB file, which has added polar hydrogens and partial charges [16].

Leena K Pappachen and et al used AutoDock version 4.0 screeing program for doking the Benzothiazole derivatives with the crystallographic structures of the targets. AutoDock screening program also used to know about the hydrogen bonding interactions of all the derived compounds. The number of hydrogen bonding will considerably increase the affinity of ligand target interaction. The AutoDock shows that most of the benzothiazole derivatives show higher hydrogen bonding between the ligand-target interactions. The hydrogen bonding interactions increases the binding energy of ligand-protein interactions. The docking scores obtained for benzothiazole derivatives (BT1, BT2, BT3, BT4) and std. tamoxifen from the preliminary docking program using using AutoDock program were −6.29, −5.25, −7.19, −7.48, −3.86, r. All the four derivatives were synthesized, characterized, and subjected to in vitro anticancer screening by MTT assay in breast cancer (MCF-7) cell lines. Compounds DBT1, DBT2, and DBT3 were the most active compounds against MCF-7 cell lines with inhibitory concentration 50% of 70.0, 64.0 and 65.0, respectively. All the four derivatives show good docking scores when compared to standard drug tamoxifen and can be concluded that all the synthesized benzothiazole ligands show good anticancer property [17].

Gurudeeban Selvaraj and et al used AutoDock 4.0 for the docking analyses, There are different bonding modes of one ligand with multiple active cavities of DPP-IV. The docking analyses indicate that the bioactive constituents, β-stigmasterol, barbamide, docosahexaenoic acid, arachidonic acid, and harman shows the best binding energies on DPP-IV receptor and hydrogen bonding with ASP545, GLY741, TYR754, TYR666, ARG125, TYR547, SER630, and LYS554 residues. This result shows that docosahexaenoic acid, arachidonic acid, β-stigmasterol, barbamide, harman, ZINC58564986, ZINC56907325, ZINC69432950, ZINC69431828, ZINC73533041, ZINC84287073, ZINC69849395, and ZINC10508406 act as DPP-IV inhibitors [18].

J. Selvaraj and et al used the AutoDock softwear for validation through structure analysis verification server. For identification, the new potential drugs against GLUT4 protein the molecular docking studies of 20 natural compounds were carried out using AutoDock. The results shows that modeled structure has 87.9% residues at the core region.It was also shows that the good binding interactions of the ligand with both the targets at very low energy level. Based on the docking energy value, H-bond interaction the compounds hesperidin, fisetin, eriodictyol, wogonin, and chrysin was selected as the most potent compounds for GLUT4 protein. Hence, It was conclude that the compound shows the Anti Diabetic activity [19].

Natarajan Kiruthiga and et al used the AutoDock 4.2 for identify the binding modes of titled compounds responsible for the activity on the receptor sites. The compound HFd with 2, 4-dimethoxy group on ring C and 7-hydroxy substitution on ring A showed binding interactions with amino acid residues of alpha amylase as Arg 61, Pro 44, His 299, Gln 41 and Asp 96. Hence the scaffolds were acts as a navigator in the management of diabetic mellitus [20].

Saravanan R.R and et al used the AutoDock program for the docking simulations in the active sites of 2XNU, which shown the successfully reproduce binding modes in terms of lowest docking energy. The target protein structures of 2XNU were docked with MPIPA which shows the excellent results as were seen by the least values of the binding energy with the help of Autodock

DIRECTOR
Yashoda Technical Campus
Satara
SATARA

v4.0, In docking studies of the title derivative it understand that the possibility of these compounds to act as effective inhibitors [21].

Humaira Nadeem and et al used the AutoDock Vina softwear forThe interactions between the compounds and active site residues of H^+/K^+ ATPase. SCH28080 was used to validate the docking results. The results clearly indicate that these novel benzimidazole-pyrazole hybrids can present a new class of potential anti ulcer agents and can serve as new anti-ulcer drugs after further investigation [22].

Chandrajit Dohutia and et al used AutoDock 4.2 for receptor molecule for the docking and also study to probe the binding free energy between the ligand library and receptor. Autodock Tools (ADT) also used for optimize the receptor and ligand molecules. For preparation of the receptor molecule, polar hydrogens, Kollman charges and AD4 type of atoms were added, while Gasteiger charges were added on the ligands and maximum numbers of active torsions were given [23].

CONCLUSION:

This review totally focused on efficiency of AutoDock softwear and its different version such as AutoDock Vina, AutoDock 4.0, AutoDock 4.2.6 for molecular docking study. This information become benchmark for reseachers those uses the AutoDock softwear for study the different therapeutic activities like Antidiabetic activity, AntiMalarial activity, Antiurase activity, Anticancer activity, Antimycobacterial tuberculosis activity, Antioxidant activity, Etc. The AutoDock and its Tools are more efficient to determine the synthesis techniques, spectral analysis, docking simulation, photochemical activities, therapeutic effects, toxicological studies. These observation based on the present review have been becoming a helpful tool to guide researchers for molecular docking study. AutoDock softwear is helpful for researcher as thissoftwear is predicting docking score which is corelate with *Invivo* or *In vitro* activity. Sp this is the ultimate tool in drug discovery.

ABSTRACT:
In the present era, many fields of research are showing great importance. Apart from the applications researchers have grown their interest in pharmaceutical application. Protein play and important side in study of various in - vitro and in - vivo studies to understand the action of drugs. Docking programs have a wide range of applications ranging from protein Engineering to the drug design. Swiss dock software was guide to authors to predict the molecular interactions that may occur between a target protein and a small molecule. After review it was analysed that Swiss dock are organised for UV-VIS spectroscopy, Synthesis, crystal, structures, etc. This article presents Swiss Dock, a web server dedicated to the docking of small molecules on target proteins. It is based on the EADock DSS engine, combined with setup scripts for curating common problems and for preparing both the target protein and the ligand input files. An efficient Ajax/ HTML interface was designed and implemented so that scientists can easily submit dockings and retrieve the predicted complexes. For automated docking tasks, a programmatic SOAP interface has been set up and template programs can be downloaded in Perl, Python and PHP. The web site also provides an access to a database of manually curated complexes, based on the Ligand Protein Database.

KEYWORDS: Molecular Docking, Swiss Dock, Drug Discovery.

INTRODUCTION:
Molecular docking is prediction of the binding affinity To achieve an optimize Conformation for both receptor and ligand and relative orientation between protein and ligand such that the free energy of the overall system minimized Molecular docking is one of the most frequently used methods in structure based drug design, due to its ability to predict the binding conformation of Small molecule ligands to the appropriate target binding site. Molecular docking has become an increasingly important tool for drug discovery Programs based on different algorithm were developed to perform molecular dockings studies which have made docking an increasingly important tool in pharmaceutical research.

Received on 07.11.2020 Modified on 24.11.2020

Asian J. Research Chem. 2021; 14(2):145-148.
DOI: 10.5958/0974-4150.2021.00027.4

The aim of molecular docking is to give a prediction of the ligand-receptor Complex structure using computation methods Swiss Dock a web Service to predict the molecular interaction that may occur between target protein and a small molecule many binding modes are generated either in a box or in a vicinity of all target cavities [1-3].

Computer aided Drug Design:
Drug design depends on knowledge of 3D structures of biomolecules that is known as structural aided drug design. in addition to small molecules biopharmaceutical induces peptides and especially therapeutic antibodies are increasingly important doss of drug and computational method for improving affinity selectivity and stability been developed.

Most docking programs are Complex computational machineries and require specific additional Sampling or Scaring parameters to which they might be very sensitive while convenient default values are often a proposed good understanding of the user manual and the original

DIRECTOR
Yashoda Technical Campus
Satara

article is always required in order to achieve meaningful prediction.

Swissdock:

Swiss Dock is the docking web server that addresses limitations described above. Well a the structure of the target protein, as well as that of the ligand, can be automatically prepared for docking. Allcalculation performed on the server side, so that docking runs do not require any Computational power from the user.

A target protein structure can be determined either by specifying its identifier from the protein data Bank. Since the calculation are performed in the CHARMM force field, Swiss dock Supports the uploading of CHARMM. Formatted files in addition to the Commonly used PDB format protein Structure can be uploaded as a set of protein structure file, Coordinate file and extra topology and parameter files if needed. Once the target protein structure has been defined it is immediately prepaid for used with CHARMM, and the Curated structure can be downloaded and reviews prior to the docking assay if needed. The performance of the backend of Swissdock was assessed by a blinding docking assay on 251 test Complexes taken from the ligand protein Database with different presents available from the web interface. The performance of Swiss Dock depends on the number of free dihedrals of the ligand.

Influence of the flexibility of the success rate observed with SwissDock the docking engine of SwissDock redocking assay Carried out on 251 protein ligand Complex.

Table No. 01

Max No. of routable bond of the Ligands	FDA Approved Drug (in %)	SR0 (%)	SR5 (%)
5	63	84	93
10	93	77	86
15	99	69	83
20	100	66	81

The fraction of the surface of the ligand which becomes buried upon complexation also has Significant effect the higher this fraction, the easier it is for Swiss Dock to identify the binding pocket, and therefore to dock the ligand inside.

Table No. 02

Influence of the fraction of the Ligand which is buried upon complexation (% BS) on the same data set.

Min % BS	SR0 (%)	SR5(%)
95	82	95
90	70	85
85	66	80
80	62	75

Swiss Dock Input Files

- Since docking assays are carried out in the CHARMM 22 /27 all-hydrogen force field.
- Target proteins and ligands that have been uploaded as CHARMM- Formatted files Can be used.
- Protein and ligands that have been submitted in PDB or be mold to format respectively have to be Converted prior to the docking itself.

Computer Aided Drug Design:

Simply rational design is the inventive process of finding new medication based on biological target the drugs are commonly organic small moleculesthats activates or inhibits function of biomolecules such like a protein. That is further give the therapeutic action to the patient. Basic in that isdrug design means the invole in molecules that complementry in shape and size of biomolecules. They bind with each other and form the bond. Drug design not relies on computer modelling. this type of modelling callled as computet aided drug design. Drug design depends on knowledge of 3D structures of biomolecules that is known as structural aided drug design. in addition to small molecules biopharmaceutical indudes peptides ans especially therapeutic antibodies are incresingly important dass of drug and computational method for improving affinity selectivity and stability been developed.

Drug design also known as efforts to develop a new drug by molecular modification of lead compound for optimization of desired efferts and minimization of side effects.

- **Web interface Inputs:**

Only three steps are required to start a docking assay through the web interface of SwissDock: users must define a protein structure, one or several putative ligands and docking parameters. They are guided throughout this short and simple submission process by a comprehensive contextual help. As mentioned above, several sample files are supplied to users and can be directly uploaded into the form simply by clicking on a link. The corresponding sample output files are also provided.

- **Target selection:**

A target protein structure can be determined either by specifying its identifier from the Protein Data Bank (15) or by uploading structure files. The first option allows users who are not familiar with 3D structure files to start a docking assay with only a PDB code. If several PDB records are available for the same target, those with a high resolution and a ligand similar to the one that will be docked should be considered first.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

- **Ligand selection:**

A ligand can be selected either by specifying its identifier from the ZINC database (23) or by uploading structure files. The former possibility allows users who are not familiar with 3D structure files to start a docking assay with only a ZINC accession code (AC). The latter allows uploading several ligands at once or uploading ligands that are not present in the ZINC database. As for the target protein, SwissDock not only supports the widely used Mol2 format, but also the direct upload of CHARMM input files describing the ligand.

Review of Litreture:

Sabrin R. M. Ibrahim and Khalid Z. Al-shaliand et al used SwissDock ADME for Molecular Docking studies of the tested metabolites estimated to shade up rational explanation of α – amylase inhibitory activity result the pharmacokinetic parameter [4].

Mohammad Kabrineand et al used SwissDock in article to investigate the possible mechanism by which selected drugs act an silico theoretical molecular docking approach was used, during this study they stimulated the binding mode of N3 against 6lu7 crystal structure using SwissDock to ensure the effectiveness of Dock result and to compare result produced by several drugs to those of N3 [5].

Kerry A. Ramshottom et al used SwissDock programme to investigate that if the software cooled accurately dock the abacavir back into the crystal structure for the protein arising from the known risk allele and if the software is able to distinguish between the HLA-associated and known HLA associated allele [6].

Long Ding and et al used SwissDock software to discover Bioactive peptide silico method peptide would be experimental in-vitro to identify the activity [7].

Dae Hawn-Kim and et al used SwissDock stimulation analysis of unbiased blind docking it was determined the top score predicted blind side for SGI-1027 and M\M to localize the binding region on PrP. The result indicates CHI-1027 interacted with and regions on PrP [8].

Jesus Campagna and et al used SwissDock for evaluation of an Allosteric BACE inhibiter peptide to identify mimetic that can interact with the loop and region of the Enzyme and prevent APP cleavage and to elucidate the mechanism of peptide 65007 allosteric inhibition in silico experiment were performed first by conducting molecular docking in SwissDock with 65007 and comparing the model to crystal structure of the genetech Ab and BACE [9].

Layla K. Mahdi and et al used SwissDock experiment with GlpO model and its Ligands shows surface representation and the carbo-hydrate ligands as sticles. A predicted binding modes for LNT with a surface representation of GlpO model [10].

ElahelKashoni – Amin and et al used SwissDockfor the active site celef is quite extended, some poses were found to occur for the ligand in this location, However a second putative interacting site was found that is located in the entrance of the central beta-barrel of the enzyme. It should be seen that this location was detected by Swiss Dock [11].

Kankana Das and et al used SwissDock in compatible lipid lingad was then docked with proteins that are available as original PDB files were SwissDock interface the results were viewed and analysed [12].

Flavia S. Darquiand et al used SwissDock for putative KpFat A and KpFatB protein structure when moldedbu using homology modling using the Swiss model workspace. Based on their sequence the semi-colum zero-Acpthioesterace crystal structure from G. Californica as a term plate and default primary parametaFurthemore molecular docking was performed [13].

Christina E. Smith and et alused SwissDock for performing the docking of NSAIDs with Capase-3 was performed [14].

Jamal Quazzaniand et al used SwissDock in Silico studies for the docking of GP269, target was prepared from the X-ray protein structure of the crystalized complex. Polar hydrogen atom were added to the protein, The docking of GP269 into the structure of Tb6PGL was performed using the Swiss Dock [15].

CONCLUSION:

From Reviewing the above literatures, it was found that the Swiss Dock Software is used to predict the molecular interaction that may occur between a target protein and a small molecule.

The Swiss Dock web server aims at providing a wide scientific community with a free and user-friendly, yet stateof-the-art protein/small molecule, docking tool. The automatic setup of protein and ligand structures, the different parameter presents and the convenient visualization and analysis of docking predictions makes it accessible to a wide audience. The EADock DSS engine behind SwissDock is especially suited for drug design, with very good success rates for small and relatively rigid ligands with less than 10 flexible rotatable bonds: the most favourable predicted BM is

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

found within 2 A˚ to the crystal structures for 77% of the 251 test complexes, and for 86% of them, such a correct BM is found within the five most favourable ones. This performance is even increased if the ligand can be buried in a well-defined binding site of its target protein.

ABSTRACT:
The process of drug development and drug discovery is very challenging expensive and time consuming. It has been accelerated due to devlopment of computational tools and methods. In current situation lots of molecular docking software are available in the market, during lireature survey it was found that Discovery Studio is suit of software for stimulating small molecule and macromolecule system. It is developed and distributed by Accelarys. It helps to Investigate and test hypothesis in silico prior it costly experimental implimentation thus reducing the time and expense involved in bringing products to market. it is developed and distributed by Dassault system BIOVIA (formerly Accelerys). During literature survey it was found that Discovery Studio software was efficiently guided to as author regarding mainly biological activities like anti-inflammatory activity, anti-tubercular activity, anti-bacterial activity, anti-viral activity, anti-diabetic activity and anti-oxidant activity.

KEYWORDS: Molecular docking, Drug discovery, Discovery studio.

INTRODUCTION:
Molecular docking is one of the most frequently used methods in structure based drug design, due to its ability to predict the binding- confirmation of the small molecule ligands to the appropriate target binding site. Discovery and development of a new drug is generally known as a very complex process which takes a lots of time and resources. So now a days computer aided drug design are used very widely to increase the efficiency of the discovery and development courses. CADD are evaluated as promising technique according to they need, in between all these structure – based drug design and ligand – based drug design. As very efficient and powerful technique in the drug Discovery and development. These both methods can be applied with molecular docking to the virtual screening for lead identification and optimization. Molecular docking is a key tool in structural molecular biology and computer assisted drug design.

DOI: 10.5958/0974-4150.2021.00025.0

Discovery studiosoftware is suit for stimulating small molecule and Macromolecule system. The product suite as astrong academic collaboration programme, supporting scientific research and makes use of a number of software algorithms developed originally in the scientific community, including CHARMM, MODELLER, DELPHI, ZDOCK, DMol3 and more [1-3].

REVIEW OF LITERATURE:
Qinggang Meng and et al used Discovery Studio Software check the Rizoma Atractylodis and Rhizoma Atractylodis Macroephalae herbal pairs against type 2 diabetes mellitus. the interaction between targets and ligands were observed and analazyed, according to CDocker interaction energy, most compounds from the herbal pair had good binding activities with receptor and nine compounds had even higher scores than those of the original ligands [4].

Shola Elijah Adeniji and et al used Discovery Studio stimulated Software to check the Anti tubercular modeling, molecular docking stimulation and insight toward computational design of novel compounds as potent antagonist against DNA gyrase receptor. Tuberculosis continue to be critical health problem causing death and illness among millions of people yearly and ranked the second leading cause of mortality

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

among the communicable infections in the world. This work accessed the application of modelling technique to predict the inhibitory activity of some prominent compounds which been reported to efficient against mycobacterial tuberculosis [5].

Sabir Ali and et al used Discovery Studio4.0 accelrys Software to check anti bacteriak, anticancer, and molecular docking studies of macrocyclic metal complexes of dihydrazide and diketone. this studies suggest an octahedral geometry for all complexes, compounds found active against B, Substillis and S,aureusand P, aeruginosa and E.coil bacteria, Zn (II) complex showed significant anticancer activity against squamous cell carcinoma cell tested by MTT assay method. Molecular docking studies with EGFR tyrosine kinase were also carried out . all these results show that some of synthesized compound have remarkable antibacterial and anticancer property [6].

Mehmet Gokhan Caglayan and et al used Discovery Studio Software to check the Electrochemical ,Spectroscopic and molecular docking studies of the insteraction between the anti –retroviral Indinavir andds DNA in this study electrochemical and DNA biosensor was developed using a straightforward methodology to investigate the ineraction of indinavir with calf thymus double –stranded deoxyribonucleic acid for the first time. The obtained results can offers insights into the inhibitory activity of indinavir, which could heip to broaden its application, thus indinavir can be used to inhibit other mechanisum and /or hallmarks of viral diseases [7].

Dominic Agyei and et al used discovery studio software 2019 to study physicochemical characterization and drud likeness evaluation of hypotensive peptides encrypted in flaxseed proteome.in this study, hypotensive peptides derived from mature flaxseed protein sequences were predicted in silico using BIOPEP-UWM with nine protease, three each form digestive, plant and microbial sources. In silico prediction of adsorption, digestion, metabolism, excetion and toxicity (ADME/Tox) profile based on physiochemical properties and Lipinski's rule of five showed that the peptides were non toxic and had desirsble drug like properties [8].

Shola Eljiah Adenjiand et al used Discovery Studio stimulated Software to check Quantum modeling molecular and evaluation of some selected quiniline derivative as antitubercular agents: discovery studio visualize software. Ligand - receptor interaction between quinoilne derivatives and the receptor (DNA gyrase). Docking study indicates that compounds 10 of the derivative with promising biological activity have the ulmost binging anti- tubercular drugs with more efficient activities [9].

Nasser Abdulatif Al- Shabib and et al used Discovery studio 4.0 software to investigate the effect of food additive dye "tartrazine" on BLG fibrillation under invitro condition. Molecular docking results ascertained that Tz binds at the hydrophobic cavityand interact with the key amino acid residues involved in the interaction with different ligands, the spectroscopic,microscopic and computational results electrostatic as well as hydrophobic interaction played a very important role in Tz–induced BLG fibrillation under invitro condition [10].

Jian Wang and et al used Discovery Studio Software to study Graphene/Feso4 namocomposite for effective removal of ten triazole fungicides from water solution . Tebucanazole as an example for investigation of the adsorption mechanism by experimental and molecular doking study. The study on adsorption kinetics and thermodynamics were done by taking tebuconazole as an example. Grapheme/Fe_3SO_4 was prepared and utilized as a adsorbent for removal of ten commonly used triazole fungicides in agriculture [11].

Deepu Mathew and et al used Discovery Studio V4.0 Software to check therapeutic molecule for multiple human diseases identified from pigeon pea (Cajanus Cajan L. Millsp) through GC- MS and molecular docking molecular mechanism behind the therapeutic potential of pigeon pea over the human disease such as rheumatoid arthritis, breast cancer, type II diabetes , malaria, measlesand sickle cell disease were revealed through GC-MS identified phyto – compound ligands with candidate protein [12].

Asif Husain and et al used Discovery Studio Software (version4.0,Accelryssoftware) check the molecular docking with COXI and II enzyme, ADMET screening and in vivo anti– inflammatory activity of oxadiazole, thiadiazole and triazole analogus of felbinae. Based on the core structure of felbinac drug, three series (4a-d,5a-d, 6a-n) of five membered heterocylic derivatives containing three heteroatoms were designed and synthesized starting from felbinac. The prepared molecules were the investigated for their anti-inflammatory, ulcerogenicity, and analgesic in experimental animal [13].

Maryam A. Jordaan and et al using Discovery Studio visualizer Software to check virtual screening and DFT calculation of FDA approved compounds similar to the non – nucleoside reverse transciptase inhibitor (NNRTI) efavirenz the compounds were subjected to screening by analyzing their drug likness, such as Lipinski's rule of

five and ADME properties. Study showed that lovastatin and simvastatin might be considered as lead compounds for further development for COVID -19 main perotease inhibitor [14].

Assia Belhassan and et al used Discovery Studio2016 Software to study novel triazolo- benzodiazepine analogues as antidepressant targeting by molecular docking and ADMET properties prediction. Docking studies suggested that eleven ligands interacted within activesiteof Drosophila melangaster dopamine transporter (Ddat)) (PDBED:4M48) [most ligands formeH-bond with amino acid phe43, Asp46, Asp475, Tyr123, Ser421 and Gln also exhibited Pi and Pi-Pi. In silico ADME evaluation of compounds shoed more than 96% intestinak absortion for all compound [15].

Mohommad k.Parvez and et al used discovery studio software to check plant derived antiviral drugs as novel hepatitis B virus inhibitors: Cell culture and molecular docking study. Docking of lamivudine indicatedstrong interaction with the modeled HBV pol active site residues that formed stable complex, similarly all the docked antiviral compounds formed very stable complexes with anti-HBV pol. Taken together,our data suggest the anti-HBV potential of thetested natural compounds as novel viral pol RT inhibitors [16].

Hanine Hadni and et al used to discovery studio software to check molecular docking andthe antimalarial activity of hybrids 4-anilino-qinoline-triazines derivatives with thewild-type and mutant receptors ofof-DHFR docking studies were performed for previously reported 4-aniloquinoline and 1,3,5-triazines based molecular hybrids. The docking result revealed that these molecular specifically with SER108 and 1LE164 in the pf-DHER binding pocket as that of best active compounds but also showed additional interactions with LEU40 and GLY44 [17].

Aliyu Wappah Mahmud and et al used discovery studio software check QSAR and molecular docking studies of 1,3,dioxoisoindoline-4-aminoquinoline as potent antiplasmodium hybrid compounds. The docking result indicates strong binding between 1,3-dioxosoindoline-4-aminoquinoline and plasmodium falciparum lactate dehydrogenase (PFLDH) ,and revealed the important of the morpholinyl substituent and amide linkerin inhibiting PFLDH. These results could serve as a model for designing novel 1,3-dioxoisoindoline-4-aminoquinolines as inhibitors of PFLDH with higher antiplasmodial activities [18].

K.Jayasheela and et al used discovery studio to check the conformational and spectroscopic characterization, charge analysis and molecular docking profiles of chromone-3-caboxylic acid using a quantum hybrid computational method. The spectroscopic profile of chromone-3-carboxylic acid (abbreviated as 3CA) was exmined using FT-IR, FT-roman,UV,1H and 13C NMR technique. Result of the docking study identified the sugar phosphate inhibitor activity of the target molecular (C3CA) [19].

Mariana Spetea and et al used discovery studio (version3.0) software to check structure activity relationship. Explorations of 14-oxygenated N-Methylmorphonan-6-ones as potent μ-Dpioid receptors against. The crucial role of relative orientation of the ligand in the u or binding site, influencing the property of critical non-covalent interaction that are required to facilitate ligand/-μ or activation by the 14-oxygenated N-methylmorphinan-6-ones,which should be useful for guiding drug design.

Shola Elijiah Adeniji and et al using Discovery Studio Visualizer software. To check the theoretical modeling and molecular docking stimulation for investigating and evaluatiny some active compounds as potent anti tubercular agents against MTB CYP 121 receptor. Docking studies revealed the best molecule with docking scores of–13.7 kcal/mol which formed H- bond and hydrophobic interaction with amino acid residue M. Tuberculosis cytochromes (MTB CYP 121) [20].

Shola Elijiah Adeniji and et al used Discovery Studio Visualizer software check the In silico study for evaluating the binding mode and interaction of 1,2,4-triazole and it's derivatives as potent inhibitors against Lipoate protein B (Lip B) research has shown that the binding affinity of these compounds wery found to be better than the recommended anti–mycobacterium drugs; isoniazid (-14.6kcal/mol) and ethambutol (- 5.8kcal/ mol). This study provide valuable approach for designing and synthesizing more potent anti–mycobacterium tuerculosis derivatives [21].

Ana- Maria Udrea and et al used Discovery Studio Visualizer software to check Laser irradiated phenothiazines: New potential treatment for COVID - 19 explored by molecular docking . In this study predict , using molecular docking, the binding affinity to 15 phenothiazines (antihistaminic and antipsychotic drugs) when interacting with the main protease SARS - coV-2 . Results reveal that thioridazine –and its identified photo products (mesoridazine and sulforidazine) have high biological activity on the virus main protease [22].

CONCLUSION:

This review totally focused on the drug designing in Discovery Studio software and it's different versions such as Discovery Studio V 4.0, Discovery Studio 2016,

ABSTRACT:
The aim of the present research work was to systemically device a model of factors that would yield an optimized release modulating dosage form of an anti-hypertensive agent, losartan potassium, using response surface methodology by employing a 3-factor, 3-level Box-Behnken statistical design. Independent variables studied were the amount of the release retardant polymers – aminated fenugreek gum (X_1), aminated tamarind gum (X_2) and aminated xanthan gum (X_3). The dependent variables were the burst release in 15 min (Y_1), cumulative percentage release of drug after 60 min (Y_2) and hardness (Y_3) of the tablets with constraints on the Y_2 = 31–35%. Statistical validity of the polynomials was established. In vitro release and swelling studies were carried out for the optimized formulation and the data were fitted to kinetic equations. The polynomial mathematical relationship obtained $Y_2=32.91-2.29X_1-5.68X_2-0.97X_3+0.20X_1X_3-0.005X_2X_3-0.92X_1^2-1.89X_2^2$ explained the main and quadratic effects, and the interactions of factors influencing the drug release from matrix tablets. The adjusted (0.9842) and predicted values (0.9600) of r^2 for Y_2 were in close agreement. Validation of the optimization study indicated high degree of prognostic ability of response surface methodology. The Box-Behnken experimental design facilitated the formulation and optimization of release modulating matrix systems of losartan potassium.

KEYWORDS: Release modulating matrix tablets; Amination of natural polymers; Losartan potassium; Box Behnken statistical design; Response surface methodology.

INTRODUCTION:
Oral drug delivery is the most preferred and appropriate preference as the oral route provides maximum active surface area amongst all drug delivery system for administration of a various drugs. Significance of these dosage forms is due to awareness to toxicity and ineffectiveness of drugs when administered by oral conventional method in the form of tablets and capsules. Developing oral sustained release matrix tablets for drug with constant release rate has always been a challenge to the pharmaceutical technologist [1]. Usually conventional dosage form produces wide range of

variation in drug concentration in the bloodstream and tissues with consequential undesirable toxicity and poor efficiency, poor bioavailability. So the maintenance of concentration of drug in plasma within therapeutic index is very significant for effective treatment and high bioavailability [2],[3]. Drug release through various matrix system is determined by Water penetration, Polymer swelling, Drug dissolution, Drug diffusion, Matrix erosion have been utilized as formulation sustained release drug delivery. Sustained release dosage forms offer better control of plasma level less dosage frequency, less side effect, increased efficacy and constant delivery [4].

A polymer is a large molecule (macromolecules) composed of repeating structural units. These subunits are typically connected by covalent chemical bonds. Both synthetic and natural polymers are available but the use of natural polymers tier pharmaceutical applications is attractive because they are economical, readily available and non-toxic. They are capable of chemical modifications, potentially biodegradable and with few exceptions, also biocompatible [5]. Derivatization of native polymer led to enhancement in bioadhesive and drug release characteristics [6]. Recently, chemical modification or derivatization of natural polysaccharides has been reported to improve the functional properties of native gums. Reports in the literature suggest that the derivatives of polysaccharides (amine, thiol, carboxymethyl) can be employed to manipulate swelling, bioadhesion and drug release [7]. A few examples of polysaccharide derivatives already reported in literature include aminated fenugreek gum [6], aminated tamarind kernel polysaccharide [8] and aminated xanthan gum [9]. Polymeric material have fulfilled different roles such as binders, matrix formers or drug release modifiers, film coating formers, thickeners, viscosity enhancers, stabilizers, disintegrants, Solubilisers, emulsifiers, suspending agents, gelling agents and bioadhesive.

Losartan potassium (LP) is a potent, highly specific angiotensin II type 1 (AT1) receptor antagonist with antihypertensive activity [10], [11]. It is readily absorbed from the gastrointestinal tract with oral bioavailability of about 33% and a plasma elimination half-life ranging from 1.5 to 2.5 h. Administration of LP in a controlled release dosage form with dual release characteristics i.e., burst release followed by an extended release over 8 h, would be more desirable as these characteristics would allow a rapid onset followed by protracted anti-hypertensive effects by maintaining the plasma concentrations of the drug well above the therapeutic concentration [12].

Response surface methodology (RSM) is one of the popular methods in the development and optimization of drug delivery systems [13]. Based on the principles of design of experiments (DOE), the methodology involves the use of various types of experimental designs, generation of polynomial mathematical relationships and mapping of the response over the experimental domain to select the optimum formulation [14]. Central composite design (CCD), 3-level factorial design, Box Behnken design and D-optimal design are the different types of RSM designs available for statistical optimization of the formulations [13]. Box-Behnken statistical design is one type of RSM design that is an independent, rotatable or nearly rotatable, quadratic design having the treatment combinations at the midpoints of the edges of the process space and at the center. Additionally, it requires fewer experimental runs and less time a and optimized thus provides a far more effective and cost-effective technique than the conventional processes of formulating and optimization of dosage forms [15].

The current study aimed at developing and optimizing an oral release modulating matrix tablet of LP using computer aided optimization technique i.e. Box Behnken statistical design with constraints on cumulative percentage release of drug after 60 min (31–35%). The Independent variables for the present study were: amount of release retardant polymers – aminated fenugreek gum *(X_1)*, aminated tamarind gum *(X_2)* and aminated xanthan gum *(X_3)*. The dependent variables studied were the burst release in 15 min *(Y_1)*, cumulative percentage release of drug after 60 min *(Y_2)* and hardness of the tablets *(Y_3)*.

MATERIAL AND METHODS:

Materials:

Losartan potassium was provided as a gift sample by Viraj Pharmaceutical. (Mumbai, India). Carbopol, magnesium stearate and microcrystalline cellulose were supplied by Thermosil Fine Chem industry. (Charhol). Feenugreek gum, tamarind gum and xanthan gum were purchased from Phyto Lifesciences Pvt Ltd. (Gandhinagar, Gujarat). Starch, isopropyl alcohol and ethylene diamine as a supplied by SD. Fine Chemicals limited. (Mumbai, India). Sodium borohydride was purchased from Karan enterprise. (Mumbai, India). All other reagent and solvents used were of analytical grade and used as received.

Amination of natural polymers:

In 3000ml water add 60gm of natural gum. To this solution add aminating agent ethylene diamine (25ml) with continuous stirring at constant temperature (20-60°C) for 6 hr). Then slowly add reducing agent sodium borohydride ($NaBH_4$) for 2 hr until formation of thick gel. Wash this gel several times with ethyl alcohol and

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

collect the precipitate of aminated derivative [6], [8], [9]. Synthesized aminated polymer was studied under further parameter for determination of flow properties, chemical stability and thermal properties.

Preparation of compressed matrix:

Drug, carbopol (binder) and the MCC (diluent) were sifted through #40 manually and mixed well to ensure the uniformity of premix blend [16]. Several drug-diluents premixes were then mixed with the selected combination and ratio of hydrophilic polymers (Aminated FG, Aminated TG and Aminated XG), previously sifted through #40, for 5 min. Premix blend was wet granulated with isopropyl alcohol and the granules were sized through #18 and were dried at 45°C for 15 min. Dried LP granules were lubricated with starch and magnesium sterate. The tablets were compressed at an average compression weight of 250mg by cold compression technique on dialed hydraulic press (KBR press) at 12.0mm, circular, flat punches at compressional pressure of 5 tons with 15 s dwell time [17],[18].

Different formulations of Losartan potassium 100mg release modulating matrix tablets were prepared using the following excipients: AFG (7.5-22.5mg), ATG (10–30mg), AXG (12.5–37.5mg), carbopol (30mg), starch (10.25mg), magnesium sterate (1.75mg) and MCC (q.s. to 250mg).

Experimental design:

Box-Behnken statistical screening design was used to optimize and evaluate main effects, interaction effects and quadratic effects of the formulation ingredients on the in vitro release of LP sustained release formulations [17],[19]. A 3-factor, 3-level design used is suitable for exploring quadratic response surfaces and constructing second order polynomial models with Design Expert® (Version 12.0.1.0, Stat-Ease Inc., Minneapolis, MN). This cubic design is characterized by set of points lying at the midpoint of each edge of a multidimensional cube and center point replicates ($n = 3$). The nonlinear computer-generated quadratic model is given as,

$$\mathbf{Y = b_0 + b_1X_1 + b_2X_2 + b_3X_3 + b_{12}X_1X_2 + b_{13}X_1X_3 + b_{23}X_2X_3 + b_{11}X_1^{\ 2} + b_{22}X_2^2 + b_{33}X_3^2}$$

Where Y is the measured response associated with each factor level combination; b_0 is an intercept; b_1 to b_{33} are regression coefficients computed from the observed experimental values of Y; and X_1, X_2 andX_3 are the coded levels of independent variables. The terms $X_1\ X_2$ and $X^{\ 2}$ $(i = 1, 2\ or\ 3)$ represent the interaction and quadratic terms, respectively. The selected dependent and independent variables are shown (Table 1, left column) along with their low, medium and high levels, which were selected based on the results from preliminary experimentation [20]. The amounts of Aminated FG (X_1), Aminated TG (X_2) and Aminated XG (X_3) used to prepare each of the 15 formulations are given (Table 2).

Table 1: Variables in Box Behnken design

Factor	Level used, actual (coded)		
	Low (-1)	Medium (0)	High (+1)
X1=AFG (%)	3	6	9
X2=ATG (%)	4	8	12
X3= AXG (%)	5	10	15
Dependent variables	Constraints		
Y1 = % Burst release in 15 min	$10 \le Y1 \le 15$		
Y2 = % Dissolution after 60 min	$31 \le Y2 \le 35$		
Y3 = Hardness (kg/cm2)	Maximize (range 3.5–5.5)		
*All percentages were calculated with respect to total tablet weight of 250mg			

Tablet assay and physical evaluation:

The tablets were assayed for drug content using methanol as the extracting solvent, and the sample were analyzed spectrophotometrically (Shimadzu- UV-1800, Japan) at 215 nm [17], [20]. Tablets were also evaluated for the hardness ($n = 6$) (Monsanto hardness tester), friability ($n = 6$) (Roche Friabilator, 100 rpm), weight variation ($n = 20$) and thickness ($n = 10$) (Vernier caliper).

Table 2: Observed responses in Box Behnken design for losartan potassium release modulating matrix tablet

In vitro drug release studies:
Dissolution studies were performed using the USP II, paddle-rotating method (Electrolab dissolution tester, Electro lab, India) at 37°C ± 0.5°C and 75rpm using 0.1 N HCl (2 hr) and phosphate buffered solution, pH 6.8 (PBS) (10 hr), as the dissolution media. Dissolution studies were carried out in triplicate, maintaining the sink conditions for all the formulations. A 5ml aliquot of sample was withdrawn at regular time intervals, filtered and assayed spectrophotometrically at 205.3nm. The cumulative % drug release was calculated for the formulations [21],[22].

Swelling and erosion studies:
Swelling and erosion studies of the matrix tablets were carried out under conditions identical to those described for the dissolution testing. After 2 hr in 0.1 N HCl and 6 hr in phosphate buffer, pH 6.8, the tablets were removed, gently wiped with a tissue paper to remove surface water and Scanning Electron Microscopy (SEM) study of the hydrated swollen tablets was carried out [17],[23]. Water uptake and mass loss were determined gravimetrically according to the following equations;

Degree of swelling (water uptake)=
(Wet weight - Original dry weight)/(Original dry weight)

Erosion (% mass loss)=
(Original weight - Remaining dry weight)/(Original weight)

Thermal properties:
Differential scanning calorimetry (DSC) experiments were performed on drug, excipients and the optimized formulation using DSC (Perkin–Elmer, Norwalk, CT). The instrument was calibrated using indium standards. Accurately weighed samples (5–10mg) were hermetically sealed in flat bottom aluminum pans and heated from 48 to 300°C at a rate of 10°C per min under an atmosphere of nitrogen. Thermograms were normalized and rescaled as needed before overlapping [11],[24].

Fourier transforms infrared spectroscopy (FTIR):
FTIR studies were performed on drug, excipients and the optimized formulation using Shimadzu FTIR (Shimadzu Corp., India). Background spectrum was collected before running each sample. The samples were analyzed between wavenumbers 4000 and 400 cm^{-1}.

Optimization data analysis and validation of optimization model:
Statistical validation of the polynomial equation generated by Design Expert® was established on the basis of ANOVA provision in the software. A total of 15 runs with triplicate center points were generated. The models were evaluated in terms of statistically significant coefficients, standardized main effects (SME) and R^2 values. Various feasibility and grid searches were conducted to find the compositions of optimized formulation. Various 3-D response surface graphs were provided by the Design Expert software. By intensive grid search performed over the whole experimental region, nine optimum checkpoints formulations were selected to validate the chosen experimental domain and polynomial equations. The optimized checkpoint formulations were prepared and evaluated for various response properties. The resultant experimental values of the responses were quantitatively compared with that of the predicted values. Also, linear regression plots between actual and predicted values of the responses were produced using MS-Excel.

RESULTS AND DISCUSSION:

Characterizations of derivetized natural polymers:
The synthesis polymers are characterized using ATR-FTIR, DSC and XRD studies. In this study, synthesis polymers are confirmed by ATR-FTIR study. The ATR-FTIR study of aminated fenugreek gum, aminated tamarind gum and aminated xanthan gum is confirmed by the appearance of a new peak at 3271 cm^{-1}, 1639.49 cm^{-1} and 2899.01 cm^{-1} respectively corresponding to NH_2 group.

Aminated fenugreek gum:
The DSC thermograms of AFG, in that the AFG shows the broad endothermic peak at 9.94°C with heat of fusion 38.33 J/g, and the exothermic peak does not appeared. These transitions occur at a lower temperature as compared with fenugreek gum. The endothermic peak is due to the loss of water content in polymer (Bassi & Kaur, 2015). The disappearance of exothermic peak due to complete degradation of polymer backbone is observed. These peak shows low thermal stability as compared to fenugreek gum i.e. decreased availability of OH groups for intra-molecular hydrogen bonding. The Tg of AFG was also observed high in AFG (47.34°C) as compared to FG (47.95°C), indicating a high degree of Crystallinity of polymer.

DSC of Aminated tamarind gum:
The DSC thermograms of aminated tamarind, in that the aminated tamarind shows endothermic peak at 82.40°C and 394.50°C with heat of flow 1.002 w/g and 9.231 w/g or the exothermic peak does not appeared. The endothermic peaks are due to the loss of water content in polymer. The disappearance of exothermic peak was 365.35°C and heat of flow 9.639 w/g, due to complete degradation of polymer backbone. The melting point was showed by 276.49°C.

DSC of aminated xanthan gum:
The DSC thermograms of aminated xanthan gum, in that the aminated xanthan gum shows endothermic peak at 71.74°C and 541.66°C with heat of flow 1.644 w/g and 9.424 w/g or the exothermic peak does not appeared.

Aminated Xanthan Gum	0.43	0.52	19.1	17.3	1.2

*All value calculated in average of five reading.

The endothermic peaks are due to the loss of water content in polymer. The disappearance of exothermic peak was 430.05°C and heat of flow 11.82 w/g, due to complete degradation of polymer backbone. The melting point was showed by 277.20°C.

The X-ray ray differactograms (XRD):
The X-ray differactograms of aminated fenugreek gum, aminated tamarind gum and aminated xanthan gum. The diffractions curve of aminated fenugreek gum, aminated tamarind gum and aminated xanthan gum was typical of amorphous material with no sharp peaks.

Flow properties and physicochemical evaluation of aminated polymers:
The bulk density, tapped density and angle of repose of synthesized polymers were increased as compared to natural polymer due to reason of chemical modification was done in natural polymer. Compressibility index and Hausner's ratio describe the flow properties of natural polymers and derivetized polymers. Observations as per compressibility index the aminated fenugreek gum shows good flow properties as compare to natural fenugreek gum and aminated tamarind gum shows poor flow properties as compare to natural tamarind gum. In case of aminated xanthan gum compressibility index is partially an increases shows good flow property. The values of Hausner's ratio are < 1.25, shows good flow. Here all derivetized polymers show good flow properties except aminated tamarind gum. Evaluation parameters like bulk density, tapped density, angle of repose, compressibility and Hausner's ratio was carried out for the natural polymers and derivetized polymers and was found to be within the limit as given in Table 3.

Drug content and physical evaluation:
Drug content of the formulations was assayed spectrophotometrically at 215nm. Assayed content of drug in various formulations varied between 98.23% and 100.30% (average 99.35%). Tablet weights varied between 249.29mg and 250.30mg (average 249.93 mg), hardness between 3.5 and 5.5kg/cm^2 (average 4.46 kg/cm^2), thickness between 3.09 and 3.12mm and friability ranged from 0.49% and 0.87% (average 0.73%). Thus all the physical parameters of the compressed matrices were found to be practically within controls.

Fitting of data to model:
A three-factor, three-level Box-Behnken statistical experimental design as the RSM requires 15 experiments (Polynomial analysis). The independent variable and the response for all 15 experimental run are given in Table 2. Eleven batches showed the burst release *(Y1)* of less than 10% and the range of *Y1* for all batches was 6.69–12.41%. The ranges of other responses, Y2 (% dissolution after 60 min) and *Y3* (hardness of the tablets, kg/cm^2), were 21.84–37.53% and 3.5–5.5kg/cm^2, respectively. All the responses observed for 15 formulations and analyzed with polynomial equation of statistics analysis [17] were simultaneously fitted to first order, second order and quadratic models using Design Expert® and the comparative values of R^2, S.D. and % C.V. are given in Table 4 along with the regression equation generated for each response. Responses *Y1*, *Y2* and *Y3* were found to follow linear, quadratic and second order model respectively (Table 4, right column). Only statistically significant ($p < 0.05$) coefficients are included in the equations. A positive value represents an effect that favors the optimization, while a negative value indicates an inverse relationship between the factor and the response. It is evident that the Aminated fenugreek gum *(X1)*, Aminated tamarind gum *(X2)* and Aminated xanthan gum *(X3)* have negative effects on the responses *Y1* and *Y2* in the following order;

ATG (X2) > AFG (X1) > AXG (X3)

Coefficients with higher order terms or more than one factor term in the regression equation represent quadratic relationships or interaction terms, respectively. It also shows that the relationship between responses and factors is not always linear. Used at different levels in a formulation or when more than one factors are changed simultaneously, a factor can produce different degree of response. The interaction effect of *X1* was seen with *X2* and *X3* for response *Y2*; and between *X1* and *X3* for response *Y3*. *X2* also showed a higher quadratic effect as compared to *X1* on response *Y2*. Percentage burst release *(Y1)* and hardness of the tablets *(Y3)* were found to fit the linear and second order models, respectively. In absence of the quadratic effects, *Y1* was mainly dependent upon the amount of ATG. For *Y3*, the critical parameters were found to be the AFG and the ATG.

p- value of lack of fit	0.6624	0.791	0.9678

[a] Only term with statistical significance are included

Standardized main effects and reliability of the models:

Standardized Main Effects (SME), presented in Table 5, SME were calculated by dividing the main effects with the standard error of the main effects [17],[25]. Only statistically significant ($p < 0.05$) values are given. The larger SME value of *X2* suggested the paramount importance of ATG on drug release. R^2-value signifies the percentage of variability in responses that are fitted to the models. In the present study, the high R^2-value of > 99% represents the reliability of the design. Additionally, the *p*-values of lack of fit were greater than 0.05, which further strengthened the reliability of the models (Table 5).

Contour plots and response surface analysis:

Two-dimensional contour plots and three-dimensional response surface plots are presented in Figure 1 which is very useful to study the interaction effects of the factors on the responses. These types of plots show the effects of two factors on the response at a time. In all the presented figures, the third factor was kept at a zero level. Figure 1 (B) and (C) exhibits a nearly linear relationship of factor *X3* with factors *X1* and *X2*, in the form of almost straight line. Response surface plots show the relationship between these factors even more clearly. However, factor *X1* and *X2* have non linear relationship Figure 1 (A) and Figure 1 (D) shows that 39.5 % drug is released after 60 min *(Y2)* when both the AFG and ATG are at lowest level and the decrease in % drug release was polymer concentration dependent. Also the ATG resulted in greater reduction in % release at 12 % level as compared to the AFG at 9% concentration. This indicates a slight non-linear trend between the factors *X1* and *X2*. Figure 1 (E) and (F) show an increasing trend for *Y2* upon the replacement of either of AFG or ATG with AXG.

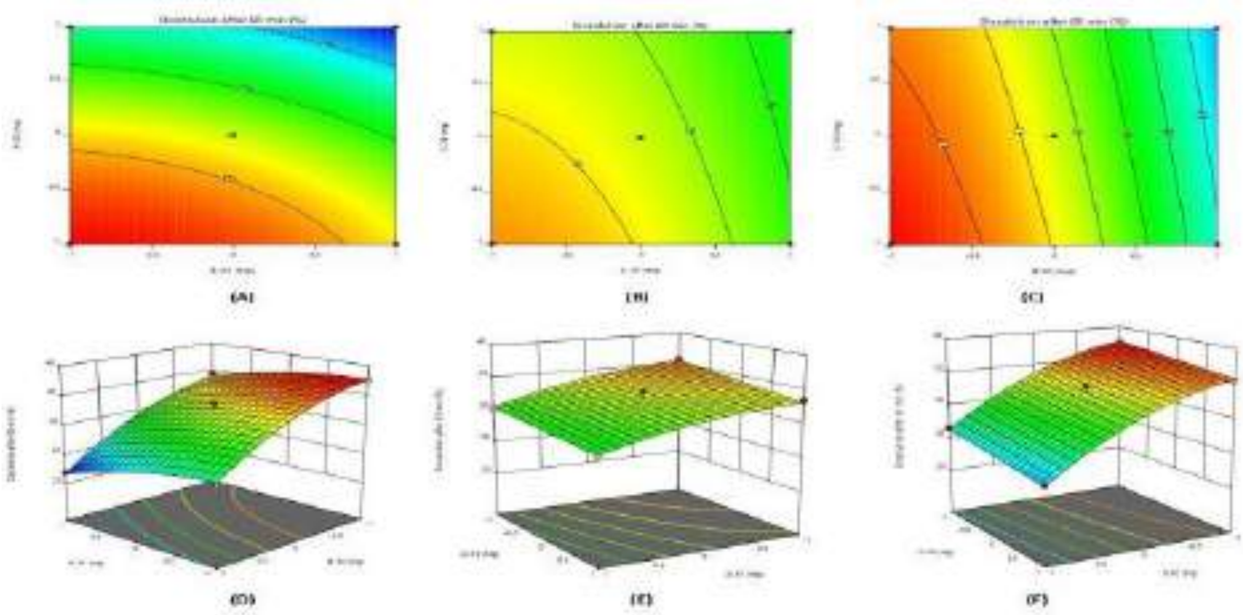

Figure1: Contour plot showing the effect of- (A) AFG (X1) and ATG (X2) on response Y2, (B) AFG (X1) and AXG (X3) on response Y2, (C) ATG (X2) and AXC (X3) on response Y2;
Response surface plot showing the effect of - (D) AFG (X1) and ATG (X2) on response Y2, (E) AFG (X1) and AXG (X3) on response Y2, (F) ATG (X2) and AXC (X3) on response Y2

Optimization:

The optimum formulation was selected based on the criteria of attaining the maximum hardness for tablets and applying constraints on Y1 ($10 \leq Y1 \leq 15$) and Y2 ($31 \leq Y2 \leq 35$). Upon 'trading off' various response variables and comprehensive evaluation of feasibility search and exhaustive grid search, the formulation composition with polymer levels of AFG- 37.40 mg, ATG- 10 mg and AXG- 24.91 mg, was found to fulfill the maximum requisite of an optimum formulation because of better regulation of % burst release and % dissolution after 1 hr time interval. The optimized formulation was found to release about 99.12% drug in sustained release manner for 12 hr. Study of the in vitro release profiles in 0.1 N HCl (for 2 hr) and in phosphate buffer, pH 6.8 (for 10 hr), of the formulations showed a burst release of 37.61% during 1 hr followed by a gradual release phase for about 10 hr. Figure 2 shows the complete dissolution profile of the optimized formulation. The optimization of the formulation was carried out from overlay plot. Overlay plot gives the area of interest or area of the experiment. In Figure 3 yellow region reflects the area of experiment.

Validation of RSM result:

For all of the checkpoint formulations, the results of the physical evaluation and tablet assay were found to be within limits. Table 6 shows the composition of optimum checkpoint formulations, their predicted and experimental values of all the response variables, and the percentage error in prognosis. Linear correlation plots between the actual and the predicted response variables were plotted and the residual plots, showing the scatter of the residuals versus actual values, are presented in Figure 4. For validation of RSM results, the experimental values of the responses were compared with that of the anticipated values and the prediction error was found to vary between 0.7533% and 0.9541%. The linear correlation plots drawn between the predicted and experimental values demonstrated high values of R^2 (ranging between 0.9300 - 0.9950) indicating excellent goodness of fit ($p < 0.001$) [26]. Thus the low magnitudes of error as well as the significant values of R^2 in the present investigation prove the high prognostic ability of the RSM [20].

Table 6: Composition of optimum checkpoint formulation, the predicted and experimental values of response variables and percentage prediction error

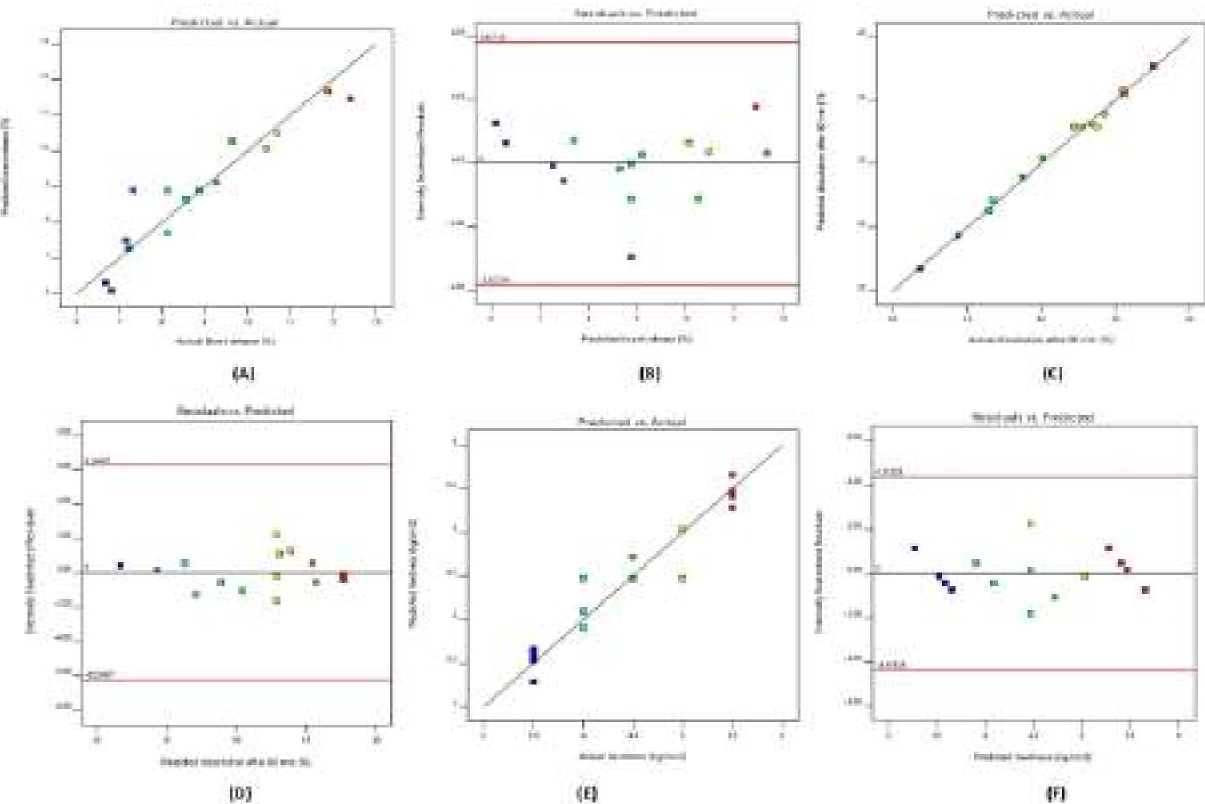

Figure 4: Linear correlation plots (A, C, E) between actual and predicted values and the corresponding residual plot (B, D, F) for various responses.

Swelling studies:

The swelling and erosion behavior of the optimized matrix tablet in 0.1N HCl and in PBS, pH 6.8, as a function of time, is shown in Figure 5. It can be observed that the hydrophilic matrix tablets underwent both swelling and erosion at the same time. The tablets achieved maximum swelling after 1 hr, which can be linked to the initial burst release of LP. Constant release can be obtained from such hydrophilic systems because of the simultaneous swelling and erosion of the matrix tablets. Constant release in such situations occurs because the increase in diffusional path length due to swelling is compensated by continuous erosion of the matrix. The cross-sectional SEM images of matrix tablets after 2 hr in acidic and 6 hr in basic media are shown in Figure 6 (A) (B). SEM study of the dissolving matrix tablets showed a uniform swelling of the matrix and further supported the fact of drug release by a diffusion process from the highly porous and swollen matrix tablets (figure 6).

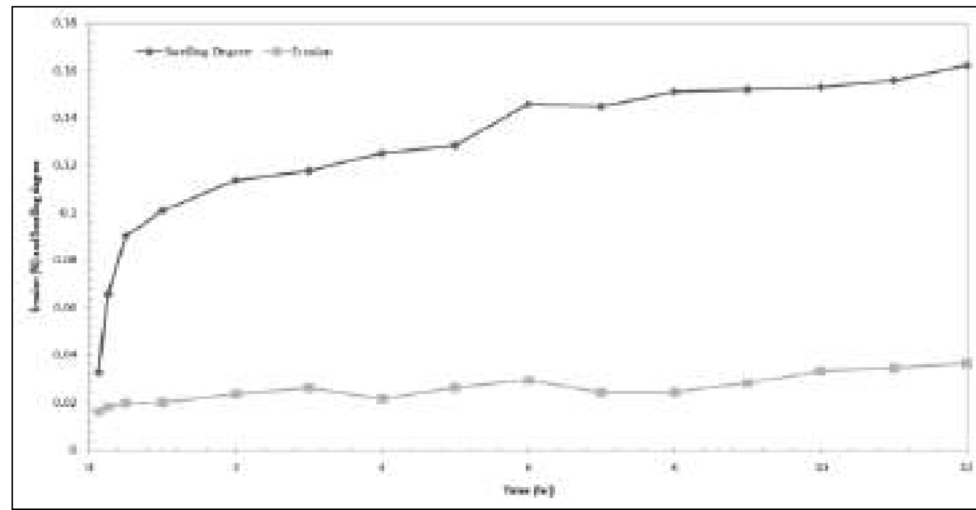

Figure 5: Erosion and swelling behavior of optimized formulation.

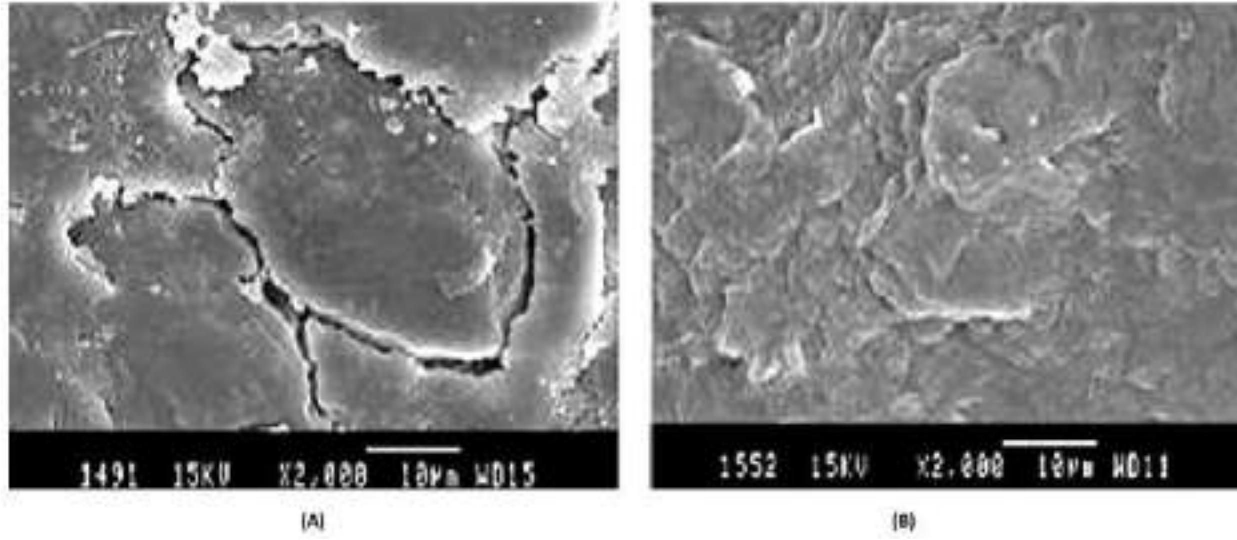

Figure 6: SEM photomicrographs showing surface topography of hydrated matrices in (A) acidic media, 2 hr (B) basic media, 6 hr.

Thermal properties:

DSC thermogram of the drug, excipients and the optimized formulation were recorded, in order to determine the thermal changes of polymers and drug before and after preparation. The characteristic endothermic peak of the drug at 255.46°C was observed in formulation also. However, the broadening of the drug peak in optimized formulation was related more to the impurities from excipients than physical interaction of the drug with the components.

Compatibility study of Losartan potassium by Fourier transform infrared (ATR-FTIR) spectroscopy:

FTIR spectra of the drug, excipients and the optimized formulation were recorded in range of 4000 – 400 cm^{-1}. LP showed some prominent and characteristic peaks at 3394 cm^{-1}, 1026 cm^{-1}, 1643 cm^{-1}, and 764 cm^{-1}, which could be assigned to stretching vibrations of O-H and C-O bond of primary alcohols, N=N stretching and C-Cl bond, respectively. In the optimized formulation, the presence of all the characteristic peaks of the LP indicates lack of any strong interaction between the drug and the excipients.

CONCLUSION:

Release modifier polymer aminated fenugreek gum, aminated tamarind gum and aminated xanthan gum was synthesized and characterized. The synthesis polymers are characterized using ATR-FTIR, DSC and XRD studies. In this study, synthesis polymers are confirmed by ATR-FTIR study. The ATR- FTIR study of aminated fenugreek gum, aminated tamarind gum and aminated xanthan gum is confirmed by the appearance of a new peak at 3271 cm^{-1}, 1639.49 cm^{-1} and 2899.01 cm^{-1} respectively corresponding to NH2 group in the FTIR spectra of aminated fenugreek gum. Hydrophilic matrix tablets of LP with AFG, ATG and AXG were prepared and optimized using a three factor, three-level Box Behnken design. The quantitative effect of these factors at different levels on the release rate could be predicted by using polynomial equations. Linearity observed between the actual and predicted values of the response variables suggested the prognostic ability of the RSM design. The quadratic response surface methodology studied for the release rate helped in understanding the interaction effects between the combination and ratio of the three polymers. DSC and FTIR studies combined with the stability study of the optimized formulation proved the integrity of the developed hydrophilic matrix tablets. Thus, high degree of prediction obtained using RSM is quite efficient in optimizing drug delivery systems that exhibit non-linearity in responses.

ACKNOWLEDGEMENT:

Shankar Kalbhare would like to thank the Viraj Pharmaceutical, Mumbai (India) for providing gift sample of pure losartan potassium.

CONFLICT OF INTEREST:

The authors declare no conflict of interest.

Abstract : Because of their ease of administration and patient compliance, mouth dissolving tablets have become more common among strong dosage types. They outperform traditional tablets in terms of efficiency. It aids in the enhancement of oral bioavailability. Waterless administration and quick onset of operation are two major advantages of mouth dissolving tablets. For any solid dosage type, disintegration is a critical phase. Superdisintegrants are a class of younger agents that have been produced in recent years. Superdisintegrants come in a variety of forms, including normal, synthetic, and co-processed. The aim of this article is to discuss the different types of superdisintegrants and their mechanisms in mouth dissolving tablets.
Keywords -Disintegration, Superdisintegrants, Mouth dissolving, Classification, Mechanism.

1.Introduction:

In an aqueous atmosphere, superdisintegrants are agents applied to tablet and certain encapsulated formulations to facilitate the breakdown of tablet and capsule "slugs" into smaller fragments, thus expanding the available surface area and facilitating a more rapid release of the medication material. They help the tablet matrix to absorb moisture and disperse.[1-3]

Mouth dissolving tablets are new medication delivery devices with fast disintegration capabilities that have recently gained prominence by addressing the drawbacks of traditional tablets. It is a solid unit dosage type containing active agent that disintegrates rapidly as it comes into contact with saliva without the use of water or chewing.[4]Disintegration is a crucial stage in the operation of any solid unit dosage type, such as tablets or capsules. Disintegrating agents are used in the solid dose formulations in this case. Fast disintegration is essential for quicker drug release and action in mouth dissolving tablets, so superdisintegrants are added to help with faster disintegration. They're used at a lower concentration of 1-10% by weight of the overall weight of the dosage units.[5] Different forms of superdisintegrants are available, and they are used in mouth dissolving tablet formulations depending on their source and method of action. Tablet disintegration is influenced by a number of superdisintegrant causes, including.[6]

Percentage of disintegrants present in the formulation.

a) Proportion of superdisintegrants used.
b) Compatibility with other excipients.
c) Method of addition of superdisintegrant.
d) Presence of surfactants.
e) Nature of drug substance added.
f) Hardness of the tablets.
g) Method of mixing of addition.[7,8]

Because disintegration is so important in tablet dissolution before the active drug substance is finally released from the tablet structure into the body, disintegrant properties (e.g., disintegration time [DT] and the ratio of crushing strength-friability to disintegration time [CSFR/DT]) are influenced to a large extent by the type, concentration, and efficiency of disintegrants.[9]

Advantages of superdisintegrant:

- Should be seen at low concentrations.
- Less focus is needed.
- Intragranularly, it's more powerful.
- It is biodegradable.
- Wetting has a remarkable ability to cause accelerated disintegration.
- There are no lumps formed during disintegration.
- It's safe to use with common medicinal agents and excipients.
- Has a lower impact on compressibility and flow capacity so it doesn't cling to the punches and dyes.
- Some are anionic, and cationic drugs can induce some in vitro binding.[10,11,12]

Disadvantages of Superdisintegrants:

- More susceptible and hygroscopic in nature;
- Moisture sensitivity causes instability;
- Expensive.
- It's time-consuming and delicate.[13]

Ideal properties of superdisintegrants:

- It can disintegrate quickly, have a low water solubility, and have excellent moulding and flow properties.
- The particle size, hydration power, and compressibility index should all be fine.
- It should be compatible with the other excipients and have tableting properties that are desirable.
- It does not form complexes with the medications, be nontoxic, and have a pleasant mouth feel.
- Effective at low concentrations and can disintegrate more efficiently.
- The tablets should be compactable and less friable.[12,14,15,16]

6757 SATARA DIRECTOR Yashoda Technical Campus Satara

Selection of superdisintegrants:

Superdisintegrant must follow those conditions in addition to its swelling properties when it is used as an excipient in the tablet formulation. The tablet disintegrant's requirements should be well specified. The perfect disintegrant should possess the following characteristics:

- Poor solubility.
- No tendency to form complexes with the drugs.
- Poor gel formation.
- Good moulding.
- Good hydration capacity.
- Good flow property.
- Good mouthfeel.
- Effective in less quantity.
- Particle size should be small.
- Should be non-toxic.
- It should compatible with other excipients and drug.[15,16,17,18]

2. Superdisintegrants:

To enhance disintegration processes, new materials known as "superdisintegrants" have recently been created.[19,20] Another type of super-absorbing substance with custom-made swelling qualities is superdisintegrants. These materials are designed to swell quickly rather than absorb large volumes of water or aqueous fluids. Superdisintegrants are used to make disintegrable solid dose forms more structurally sound. They are physically scattered throughout the matrix of the dosage form, and when exposed to a moist environment, they expand.

One gram of superdisintegrant absorbs 10-40 g of water or aqueous media on average. Following absorption, swelling pressure and isotropic swelling of the superdisintegrants particles generate stress concentrated zones with a gradient of mechanical characteristics, causing the entire structure to disintegrate, as seen in fig.1.[15]

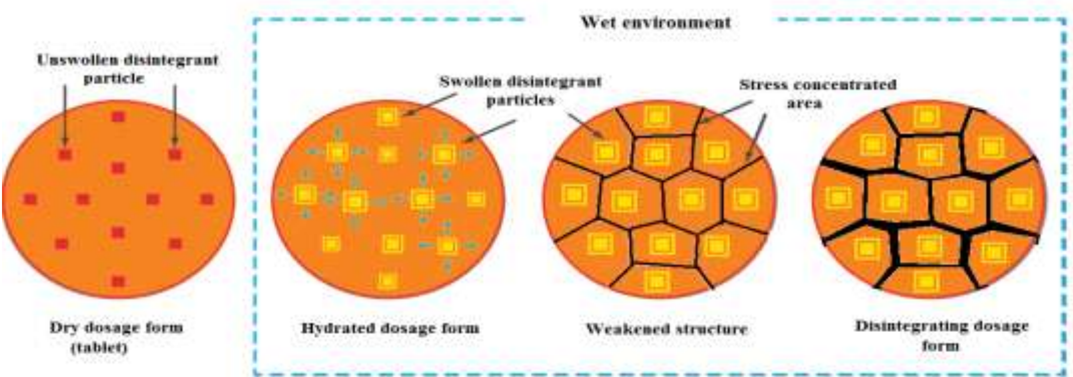

Fig.1: disintegration mechanism of superdisintegrant materials

2.1 Method of Incorporation:

The incorporation of superdisintegrants in the dosage forms are mainly of three types.

Intragranular or during granulation-

The superdisintegrants are mixed with other powders and then granulated in this procedure. Superdisintegrants are thereby absorbed into the granules.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Advantage-

Easy to add and suitable for direct compression method.[21,22]

Extragranular or before compression-

In this process, the superdisintegrants are mixed with prepared granules before compression.

Advantage-

Suitable for wet granulation process.[21,22]

Incorporation of superdisintegrants at intra- and extra-granulation step:

A portion of the suyperdisintegrants is added to intragranular and a portion to extragranular in this process. In comparison to Type I and Type II, this approach typically yields superior results and more thorough disintegration.[23]

Advantage-

This method is more effective and provides immediate tablet disintegration.[21,22]

2.2 Mechanism of superdisintegrants:[19,24,25,26,27]

The mechanism for breaking the tablets into small pieces and producing a homogeneous suspension is as follows:

1) Swelling
2) Porosity and capillary action(Wicking)
3) Heat of wetting
4) Chemical reaction(Acid-Base reaction)
5) Particle repulsive forces
6) Deformation recovery
7) Enzymatic reaction
8) Combination action(Swelling and wicking)

2.2.1 Swelling

Tablet disintegration is most commonly caused by swelling in both natural and manufactured superdisintegrantas. When the tablet comes into contact with a suitable medium, the first stage in this mechanism is water penetration, followed by swelling of the disintegrant particle, which leads to the generation of swelling force, resulting in tablet disintegration as illustrated in fig.2.

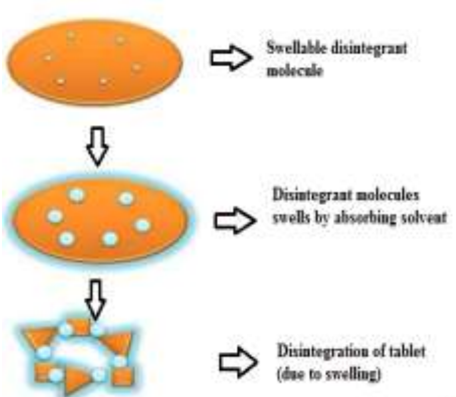

Fig.2: disintegration of tablets by swelling mechanism

YASHODA TECHNICAL CAMPUS SATARA
DIRECTOR
Yashoda Technical Campus
Satara

2.2.2 Porosity and capillary action(Wicking)

Porosity and capillary action are thought to be responsible for the disintegration action of effective disintegrants that do not swell. Tablet porosity creates routes for liquids to penetrate the tablet. When we immerse the tablet in an appropriate aqueous medium, the medium enters the tablet and replaces the air adsorbed on the particles, weakening the intermolecular link and causing the tablet to disintegrate into tiny particles. The hydrophilicity of the drug/excipient as well as tableting circumstances influence water absorption.Maintenance of a porous structure and low interfacial tension towards aqueous fluid is required for these types of disintegrants, which aids in disintegration by producing a hydrophilic network surrounding the drug particles, as seen in fig.3.

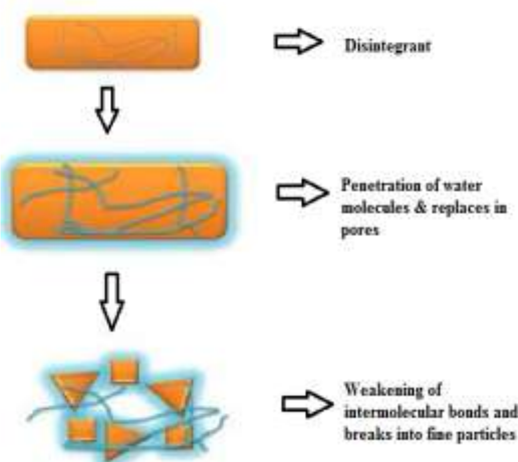

Fig.3: disintegration of tablet by wicking mechanism

2.2.3 Heat of wetting

This method can be used with any disintegrant that has an exothermic feature. When these disintegrants come into touch with appropriate media and get moist, capillary air expansion causes localised stress, resulting in tablet disintegration.[28]

2.2.4 Chemical reaction (Acid-Base reaction)

Due to the interaction of tartaric acid and citric acid with alkali metal carbonates or bicarbonates in the presence of water, the tablet is swiftly broken apart by internal CO2 release in water. The pressure within the tablet causes the tablet to dissolve.

2.2.5 Particle repulsive forces

This approach, which is based on Guyot-particle Hermann's repulsive theory, generates tablet breakdown by using non-swellable disintegrant particles. Tablet disintegration is caused by electrostatic repulsion between particles, which necessitates the use of water. Researchers discovered that wicking is secondary to repulsion.“Tablet in contact with appropriate medium, water enters into the tablet through hydrophilic pores, resulting to the production of a continuous starch-like network that assists in the transfer of water from one particle to another particle and causes hydrostatic pressure,” according to Guyot-Hermann repulsion theory. As a result, hydrogen bonds and other forces that hold tablet particles together are broken, as seen in fig.4.[29]

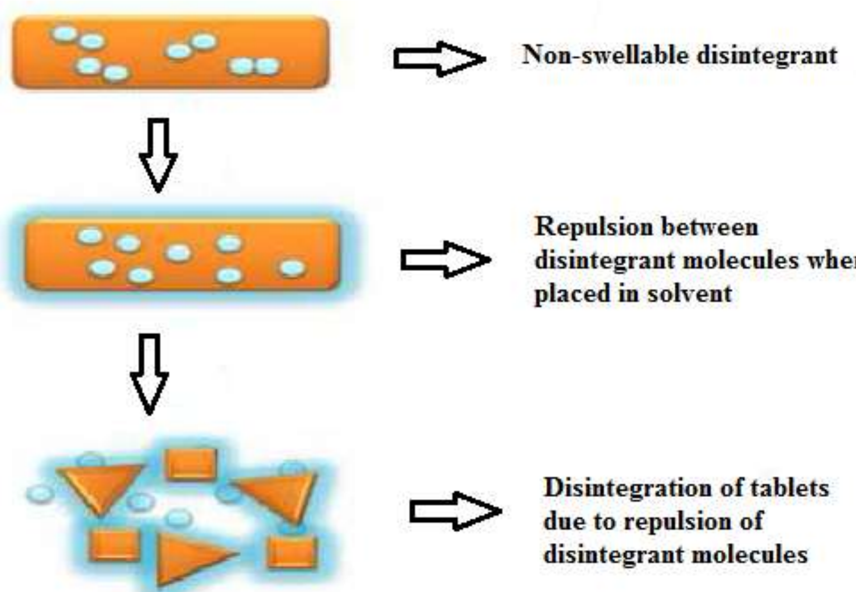

Fig.4: disintegration of tablets by repulsion mechanism

2.2.6 Deformation recovery

Starch grains are supposed to be "elastic" in nature, which means that if they are distorted under pressure, they will revert to their original shape once the pressure is released. However, because to the compression forces used in tableting, these grains are thought to remain permanently damaged and are described as "energy rich," with the energy released when exposed to water. In other words, the potential of "energy rich" starch grains to expand is greater than that of starch grains that have not been distorted under pressure. The activity of most disintegrants is thought to be the result of many mechanisms. Inter-relationships between these fundamental mechanisms are more likely to be the cause.

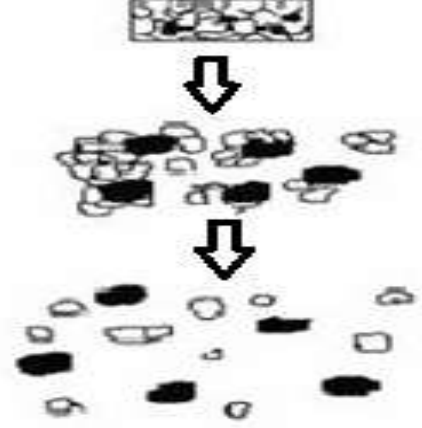

Fig.5: disintegration of tablets by deformation mechanism

2.2.7 Enzymatic reaction

Our bodies include enzymes that function as disintegrators by reducing the binder's capacity to bind. Swelling causes pressure to be applied in the outer direction, causing the tablet to rupture, or fast water absorption creates a massive rise in the volume of granules, promoting disintegration. One body enzymes which help in disintegration of tablets are given in the table 1.

2.2.8 Combination action

The swelling and wicking mechanisms of the disintegrant induce the pill to break down.

Example: Crospovidone

2.3 Classification of superdisintegrant

a) Natural superdisintegrant
b) Synthetic superdisintegrant
c) Co-processed superdisintegrant

2.3.1 Natural superdisintegrant

Advantages

- Low cost compared to synthetic and renewable sources.
- Eco-friendly and bio-acceptable.
- Locally available.

2.3.2 Synthetic superdisintegrant

Advantages

- More effective intragranually.
- When compared to starch, it is effective at low concentrations.
- Have a negligible impact on compressibility.
- Have a minor impact on the capacity to flow.

2.3.3 Co-processed superdisintegrant

Excipient granulates are formed by co-processing excipients, which have better qualities than physical mixes of components or individual components. The procedure is used in order to achieve a synergistic change in the particular unwanted trait.

Table 2: name and mechanism of natural superdisintegrants[30,31,32]

3. Conclusion

In the creation of mouth-dissolving tablets, superdisintegrants play a significant role. In an aqueous environment, superdisintegrants aid in the breakage of the tablet into smaller fragments. Superdisintegrants have been examined in terms of selection criteria, benefits, drawbacks, ideal qualities, technique, mechanism, and categorization. The approach of adding superdisintegrants via direct compression has gained appeal among researchers. Mouth dissolving tablet formulations are less complicated than other patented methods due to their simplicity of availability and compactness.

ABSTRACT

The goal of this study was to develop and test a topical gel containing an Itraconazole microemulsion (ITZ). A preformulation research was conducted before the formulation of Itraconazole microemulsion. To determine the maximal solubility of ITZ in oils, surfactants and co-surfactants were tested to determine excipient potential. In order to microemulsion region, with Karanj oil as the oil phase, Tween 80 as the surfactant, and Isopropyl alcohol (IPA) as the co-surfactant, a pseudoternary phase diagram was created. The optimized ME of ITZ was characterized by its qualitative & Quantitative test & incorporated into polymeric gels of Carbopol (CBP), Xanthan gum, Carbopol 934, Carboxymethyl cellulose (CMC), Carboxymethyl -Tamrind gum (CMTG). ME evaluated by % transmittance, Viscosity, pH, particle size, zeta potential, Physical appearance, Drug content, pH, spreadability, viscosity, In -vitro release. Stable ME was obtained when Karanj oil was taken as oil phase, Tween 80 as surfactant & IPA as co-surfactant at the weight ratio of 5:45:50. The optimized ME based gel shows pH range 6.0- 6.34, Spreadability in the range of 0.56-1.06gm.cm/sec. The viscosity study indicated pseudoplastic behavior of all ME based gel formulations. Amongst the studied ME gels CBP: CMTG containing gels showed maximum drug release at the end of 6h. The prepared MEG show better release profile than marketed preparation.

KEYWORDS: Itraconazole, Microemulsion based gel, Pseudoternary Phase Diagram, Topical drug delivery.

INTRODUCTION

Approximately two-thirds of the world's population is infected with a common fungal illness.[1] Fungal infection is a frequent infection that affects two-thirds of the world's population. In recent years, the prevalence of fungal infections caused by fungi including Candida, Aspergillus, and Cryptococcus has increased. Skin diseases caused by fungi are known as mycoses. Candida skin infections can affect practically any part of the body, but they're most common in intertriginous areas, where two skin patches rub or touch.[2,3]

Itraconazole (ITZ) is a triazole antifungal with a wide range of activity. It's a medication from the BCS class II. Bioavailability of Itraconazole in conventional dose formulations was around 15-20%. It has a 6-hour biological half-life. Constipation, abdominal pain, headache, and, in rare cases, heart failure have all been reported as side effects of ITZ. The fact that ITZ is contraindicated in patients with renal and/or hepatic impairment is also a drawback.[4,5]

Topical treatments, such as creams and ointments, are sticky and need rubbing, which can make patients uncomfortable. As a result of their numerous advantages over other semisolid preparations, gels have gained prominence in both the pharmaceutical and cosmetic fields.[6] Gels are characterised as a semi-rigid system in which the dispersion medium's moment is limited by interlacing three-dimensional networks of particles. They are non-invasive and patient-friendly, are less greasy, and can be easily removed from the skin. They're also affordable, have a localised action with little side effects, boost medicine absorption, reduce dose frequency, and stabilise drug distribution patterns.[6,7] Despite the many benefits of gels, one important drawback is the delivery of hydrophobic medicines. As a result, a microemulsion-based approach is being employed to break through this barrier, allowing even a hydrophobic medicinal moiety to benefit from the special features of gel.[8]

Microemulsions (MEs) have gained in popularity and attention in recent years due to their unique properties. Industrial laboratories, as well as academic researchers and those working in the pharmaceutical industry, have shown an interest in these compounds, which has led to their use in a variety of administration methods. The stable MEs are simple to make and can improve the solubilizing efficacy of both hydrophilic and lipophilic pharmaceuticals, hence increasing drug permeability.[9] ME's low viscosity, on the other hand, makes it difficult to

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

apply to the skin and reduces patient compliance.[10] When compared to solution, gel, or formulations, MEs or ME gels dramatically improve medication absorption. Natural polymers are cost-effective in distribution systems because they are readily available. They're also biodegradable, biocompatible, and easily accepted by regulatory bodies.[11]

Polymers including carbopol (CBP), hydroxypropyl methylcellulose (HPMC), carboxymethyl-tamrind gum (CMTG), carboxymethyl cellulose (CMC), and in the creation of ME gels, natural polymers such as xanthan gum (XG) have been characterized.[29,12-14]

Karanj oil, a non-edible semi-drying fixed oil derived from seeds of Pongamia pinnnata belonging to the Fabaceae family, is one of the natural.[9] According to the literature, Karanj oil is a therapeutic oil that is mostly used to treat itches, abscesses, and skin problems.[10] As a result, Karanj oil can be utilised as an oil phase in the formulation of microemulsion-gels for topical delivery of drugs that are weakly water soluble, potentially improving absorption and prolonging drug release.

As a result, it was proposed to develop and test ME including topical gels of CBP, XG, TG, CMTG, and CMC for better hydrophobic drug delivery. Further research was carried out to determine the viscosity and drug release of the produced gels. ITZ's gastrointestinal adverse effects may be mitigated by a recently developed ME-based gel.

2. MATERIALS AND METHODS

2.1 Materials

Aurochem Pharmaceuticals Pvt. Ltd., Palghar, provided ITZ. Loba chemie, Mumbai, provided Tween 80, isopropyl alcohol (IPA), olive oil, Tween 20, polyethylene glycol 400 (PEG400), and carboxymethyl cellulose (CMC). S.D Lab chemical centre in Mumbai provided xanthan gum and oleic acid. All additional chemicals were acquired from Loba Chemie in Mumbai and were of analytical quality.

Table 1. Formulation of microemulsion based gels.

Formulation code	F1	F2	F3	F4	F5	F6	F7	F8	F9

2.2 Solubility study of ITZ

The oils and excipients were chosen due to itraconazole high solubility in them. Based on the literature analysis, Karanj oil was chosen as an efficient excipient for micro- emulsion formation.

The solubility of itraconazole in several oils (Karanj oil, Olive oil, Oleic acid) was studied to determine the best oil for usage as the oil phase in microemulsion. Itraconazole solubility in several surfactants (Tween-20 and Tween-80) and cosurfactants (Isopropyl alcohol, propylene glycol PEG-200, PEG-400) was also investigated. In stoppered vials (capacity 10mL), an excess amount of itraconazole was added to 3mL of the specified oil, surfactant, and cosurfactant, and then preliminary mixing was carried out over magnetic stirrer for a few minutes. These vials were then held at 37 ± 0.5^{0}C for 72 hours in a mechanical bath shaker. After that, the equilibrated samples were centrifuged (Remi) for 15 minutes at 3000 rpm. The supernatant was collected, membrane was filtered and spectrometric sample measurements at 262nm. determined solubility after proper dilution by methanol.Each experiment was carried out three times.[15]

2.3 Construction of pseudoternary phase diagram

The difference fraction of mixed surfactant was often used in the building of a phase diagram, and the surfactant and cosurfactant optimal ratio (Km) was estimated using the microemulsion area. Km was investigated using a simple pseudoternary phase diagram. The generation of microemulsions utilising a four-component system consisting of an oil phase, a non-ionic surfactant, a cosurfactant, and purified water was investigated using pseudoternary phase diagrams (aqueous phase).

Titration of homogeneous liquid mixes of water, surfactant, and cosurfactant with oil phase at ambient temperature yielded the pseudo ternary phase diagram. Surfactant and co-surfactant were combined in a 1:9 to 9:1 ratio. The nine samples were mixed consistently and

6757 YASHODA TECHNICAL CAMPUS SATARA
DIRECTOR
Yashoda Technical Campus
Satara

independently with water, and then the oil was added drop by drop to the mixture. Water content was set at 2.0 gm, and the total amount of surfactant and co-surfactant was also set at 2.0 gm. To allow for equilibration, samples were agitated by a vortex shaker during the titration. The combination was visually evaluated for transparency after the addition of an aliquot of oil, until the system became slightly hazy. The microemulsion window was discovered to exist as the area where clear and transparent formulations may be seen upon visual inspection. The water ratio was held constant, and the oil, surfactant, and cosurfactant formed the pseudoternary phase diagram.[16]

2.3 Construction of Ternary Phase Diagram

The best surfactant and cosurfactant weight ratio (Km) was chosen. The contents of mixed surfactant and oil in the mixtures varied from 9:1 to 1:9. A homogeneous oil surfactant–cosurfactant blend was created, where Km was fixed and the contents of mixed surfactant and oil in the mixtures varied from 9:1 to 1:9. The total amount was kept at 1.0 g. Drop by drop, purified water was added to each mixture. To allow for equilibration, samples were agitated with a magnetic stirrer during the titration. The combination was visually evaluated for clarity after an aliquot of water was added until the system became slightly cloudy.[17]

2.4 Preparation of ITZ ME

The Smix ratio with the largest microemulsion region was chosen. Oil and Smix were blended in various quantities. Itraconazole was dissolved in a mixture of oil and Smix at room temperature using magnetic stirring. Dropwise additions of double distilled water to the oily mixture were made until a clear and transparent microemulsion was formed. With mild magnetic stirring, the mixture was allowed to stabilise and reach equilibrium for 15–20 minutes. Itraconazole-containing microemulsions were then kept at room temperature.[18]

2.5 Qualitative and Quantitative tests for ME

Dilution test

The dilution test was performed by diluting 1 ml of prepared ME(s) to 100 ml and observed for clarity/turbidity/phase separation. It is confirmatory test of microemulsion to know which type of microemulsion was formed.

Centrifugation

Centrifugation test was used to evaluate physical stability of microemulsions. Microemulsions were centrifuge (Remi Laboratories, Mumbai, India) at 5000 rpm for 10 min and system was evaluated for creaming or phase separation by visual observation.[19]

pH of microemulsion

pH of microemulsion was determined by using digital pH meter (Systronics).

Transmittance (%T)

The percentage transmittance of 2ML ME(s) was checked against distilled water using UV-VIS spectrophotometer at 650 nm.

Drug Content Studies

In a 50 ml volumetric flask containing methanol, a microemulsion equivalent to 5 mg of itraconazole was placed and swirled for 30 minutes. Methanol was used to increase the volume to 50 mL. The resulting solution was further diluted by 2 ml of methanol using a membrane filter of 0.45µm.The absorbance of the solution was measured spectrophotometrically (Shimadzu UV, Japan) at 262nm.[20]

Dispersion stability studies

For 30 minutes, the formulations were centrifuged at 3500 rpm. For the heating and cooling cycle, no phase separation formulations were used (freeze thaw cycle). Six cycles were performed in a hot air oven at temperatures ranging from 4°C (refrigerator) to 45°C, with storage at each temperature for at least 48 hours. For further research, the formulations that were stable at these temperatures were chosen.[15]

Transmission electron microscopy

Transmission electron microscopy was used to examine the morphology of itraconazole microemulsion (CM200, Philips, FEI Company). One drop of diluted samples was put on film-coated copper grids, dried, and studied under the electron microscope after being negatively stained with 2 percent phosphotungstic acid (PTA).[21]

Globule size and zeta potential measurements

The globule size and zeta potential were assessed using the zetasizer nano-zs (Malvern instrument). At a temperature of 25°C, the experiment was carried out. A 1ml sample was diluted with double distilled water.[22] The globule size and zeta potential were assessed using

DIRECTOR
Yashoda Technical Campus
Satara

the zetasizer nano-zs (Malvern instrument). At a temperature of 25°C, the experiment was carried out. Double distilled water was used to dilute a sample of 1ml.[22]

2.7 Preparation of ME based gels of ITZ

Distilled water was used to make blank gels of various polymers. In a nutshell, the polymer was dispersed in 100 mL distilled water and blended for 60 minutes using a mechanical mixer (Remi). For carbopol gels, triethanolamine was utilised as an alkalising agent.[23] For the ME preparation, the preservative was first thoroughly combined with a mixture of oil and Smix. The medicine, Itraconazole, was then dissolved in the aforesaid mixture at room temperature using magnetic stirring. Dropwise additions of double distilled water to the oily mixture were made until a clear and transparent microemulsion was formed. With mild magnetic stirring, the mixture was allowed to stabilise and reach equilibrium for 15–20 minutes. All itraconazole-containing microemulsions were then kept at room temperature.[18] The gels and microemulsions were combined in a 1:1 ratio.[24] The following table lists the formulation batches in detail. 1.

2.8 Characterization of ITZ containing ME based gels

Attenuated total reflectance – Fourier transform infrared spectroscopy

The infraround spectrophotometer of ITZ, ME, was utilised in order to get a reduced total reflectance-Fourier transform infraroad (ATR-FTIR) (Shimadzu, IR Affinity, Japan).The samples were delivered to the ATR compartment for analysis. At an average of 25 scans and a resolution of 4/cm, the spectra for the range 600-4000/cm were acquired.

Physical examination

Prepared ME based gel formulations were investigated for physical characteristics like colour, homogeneity and phase separation.[25]

Drug Content

Drug content of emulgel was measured by UV spectrophotometer. 1 gm of emulgel was diluted to 50 ml with methanol. 2ml of this solution was further diluted methanol. The absorbance of the solution was measured spectrophotometrically (Shimadzu UV, Japan) at 262nm.[26]

Spreadability study

1gm of itraconazole emulgel was placed in a 1 cm diameter circle pre-marked on a glass plate, which was then covered with a second glass plate to assess spreadability. The upper glass plate was permitted to rest for 5 minutes with a weight of 500 grams on it. The gel spreading was noted from the change in diameter of gel placed.[27]

Determination of pH

The pH of itraconazole emulgel was determined by using digital pH meter (Systronics), at ambient room temperature.[28] The calibration of pH meter was done with buffered solution before each use.

Rheological Studies

The viscosity of the different emulgel formulations was determined at 25°C using a cone and plate viscometer (Brookfield rheometer RS plus).[29]

In vitro drug release studies

A Franz diffusion (FD) cell was used in the in vitro drug release research (with effective diffusion area 3.14 cm2 and 25 ml cell volume). The formulation was applied to the FD cell's egg membrane, which was sandwiched between the donor and receptor compartments. As a dissolving medium, phosphate buffer pH 7.4 was utilised. A circulating water jacket kept the temperature of the cell at 37 0C. The solution was continuously stirred using a magnetic bead while the entire assembly was kept on a magnetic stirrer. As a control, a similar blank set was run at the same time. At appropriate time intervals, a sample (1 ml) was taken and replaced with equal volumes of fresh dissolving media. After proper dilutions, samples were tested for drug content using a UV visible spectrophotometer (Shimadzu UV1800). The total percentage of drug released was computed.[30]

3. RESULTS AND DISCUSSION

3.1 Solubility of ITZ

ITZ's physicochemical features indicate that it could be useful for topical medication delivery. Karanj oil (108.40±1.59) had the highest ITZ solubility among the selected oils that were examined, hence it was chosen as an oil. Tween 80 (246.62±16.08) demonstrated reasonable solubilizing capability for ITZ among the surfactants . ITZ is most soluble in the co-surfactant isopropyl alcohol (IPA) (Freely soluble).

Table 2: Solubility of itraconazole in various oils, surfactants and co-surfactants.

	Vehicle	solubility of itraconazole (mg/ml)
Oils	oleic acid	64.02±1.32
	Karanj oil	108.40±1.59
	Olive oil	25.68±1.37
Surfactants	Tween-20	190.12±17.12
	Tween-80	246.62±16.08
Co-surfactants	Isopropyl alcohol	Freely soluble
	Propylene glycol	151.89±18.3
	PEG-200	110.58±15.52
	PEG-400	125.65±16.3

3.2 Construction of Pseudoternary Phase diagram

The pseudoternary phase diagram of oil (Karanj oil)/IPA / Tween 80/ water system were constructed as shown in Figure. The region giving clear and transparent formulation was considered as the ME window and was marked in pseudoternary phase diagram. The best weight ratio of surfactant and cosurfactant (Km) was discovered to be 6:4, thus for subsequent investigation, the best surfactant combination (Smix) comprising Tween 80 and IPA in a 6:4 ratio was blended with the highest oil (Karanj oil).

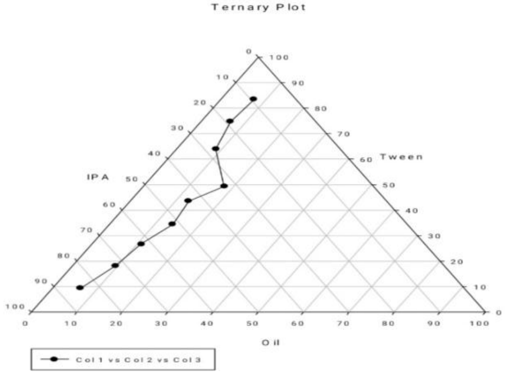

Figure 1: Pseudoternary phase diagram of the system containing Karanj oil, Tween 80, IPA and water.

3.3 Ternary Phase Diagram

The region of ME and concentration ranges of components used for formulation of ME were determined by phase studies. The effect of different surfactant /cosurfactant weight ratios on extent of stable ME region was also studied. The phase diagram of the system including oil, Smix, and water was created and is shown in fig. The microemulsion zone (ME region) in the figure is black, whereas the non-ME region is white. It is evident from the figure that tween80 and IPA could give considerable micro emulsification region (>40%).[15]

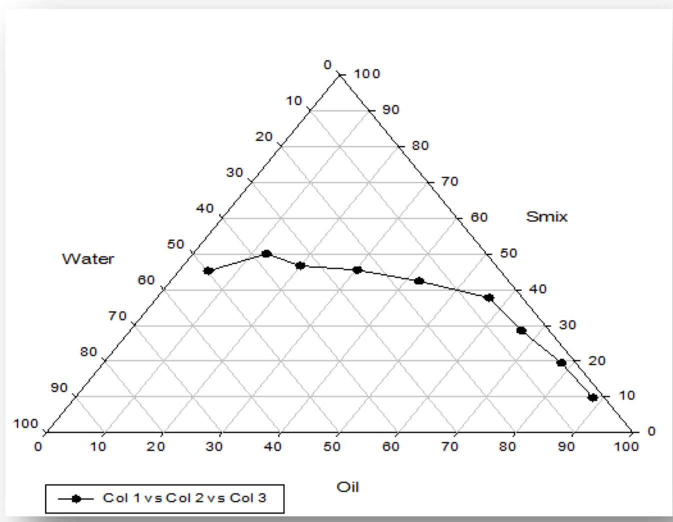

Figure 2: Phase diagram of the system containing Karanj oil, mixed surfactant and water.

3.4 Preparation of ITZ MEs

The Smix ratio with the highest ME region was chosen from the ternary phase diagram. When the weight ratios of Oil: Smix : water of 5:45:50 [M1], 10:45:45 [M2], and 10:50:45 [M3] were utilised, oil-in-water ME was generated.

3.5 Qualitative and quantitative tests of MEs

Results of qualitative and quantitave tests of all prepared MEs are given Tables.

Dilution Test

Except for formulation M1, all microemulsions generated showed phase separation and turbidity.

Centrifugation

Centrifugation test was performed to evaluate physical stability of micro-emulsions. Formulations M2 and M2 showed creaming /phase separation while other formulation was stable at centrifugation.

pH of microemulsion

The pH values of microemulsions were varied from the range 5.06 to 5.15 which was acceptable pH of skin.[31] This is an important parameter as the skin pH ranges between pH 5.0-6.5.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Transmittance (%T)

Transmittance for all formulations are given in table and found to be in the range of 71.2 to 98.3 %. Formulation M3 shows less transmittance due to turbidity while formulation M1 shows high transmittance due to clarity.

Drug Content Studies

Dispersion stability studies

The formulations M1 stable at these temperatures were selected for further studies.

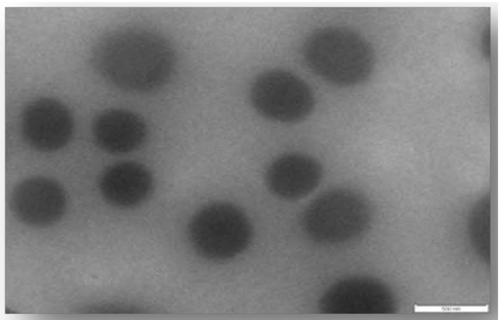
From above results the formulation M1 shows more stability than other formulations. So, M1 microemulsion was further incorporated into gelled base.

Table 3: Dilution, Centrifugation, pH, Transmittance, Drug content, Dispersion stability studies results.

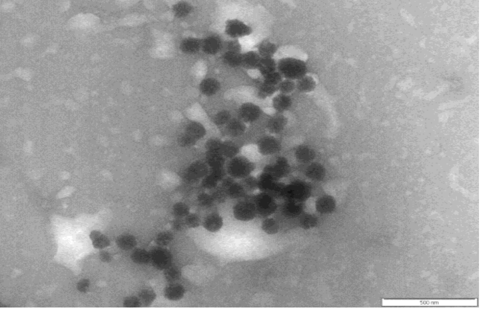
Formulation code	M1	M2	M3
Dilution test	No phase separation	Phase separation	Phase separation
Centrifugation/ creaming	No	Yes	Yes
pH	5.15	5.11	5.06
Transmittance	98.3	75.5	71.1
Drug content	99.3	98.5	95.1
Dispersion stability	Stable	Unstable	Unstable

Transmission electron microscopy

In the transmission electron microscope, the globules of optimised ME seemed to be virtually spherical in shape. In the light environment, the globule appeared dark (Fig.).The average droplet size of optimized ME was 136.4 nm. The globule size of optimized ME increases as compared optimized blank ME.



Test ME TEM



Blank ME TEM

Measurement of globule size and zeta potential

Globule sizes of microemulsion were found to be 885.5dnm and 136.4dnm respectively test and blank ME formulations. The small globule size of microemulsion was due to large percent of Smix. Similarly, zeta potentials were observed to be -0.118mv and 0.00365mv respectively test and blank ME formulations.

Evaluation of ME gel

Melting Point

The melting point of itraconazole was found to be 166.2^{0}C. The reported melting point of drug was 166-170^{0}C.

FTIR Spectrum of Interoretation

Itraconazole's FTIR spectra revealed peaks at 1583.27 (C-N stretching), 1700.91 (C=O stretching), 1187.94 (C-H aromatic), 1141.65 (C-N stretching), 3440.39 (aromatic C-H stretching), 2927.41, and 2856.66 (C-N stretching) (aliphatic C-H stretching).

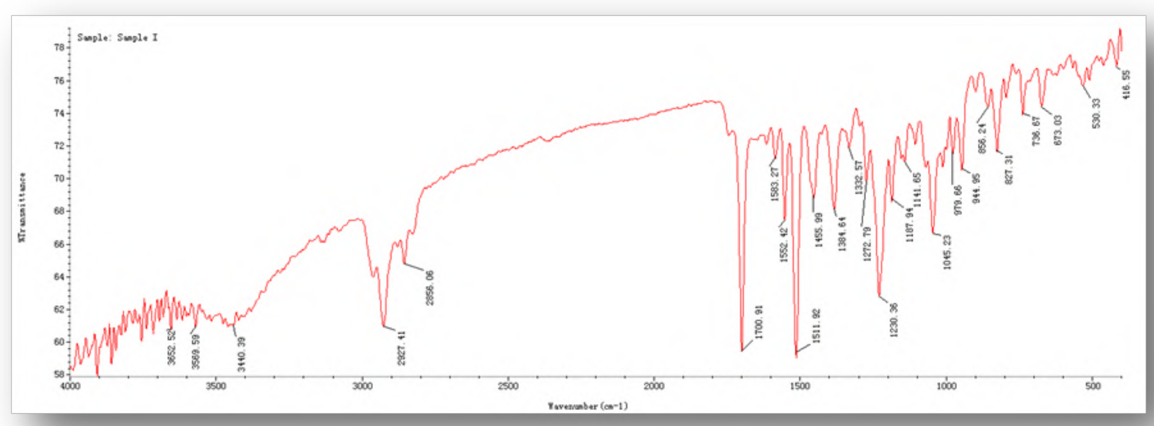

Fig 6: IR spectrum of Itraconazole.

Physical Examination

All ME-based gel formulations were white/buff thick creamy preparations with a smooth uniform texture and a glossy appearance.[33]

Drug content

Drug content was calculated using the equation, which was obtained by linear regression analysis of calibration curve of itraconazole in methanol. The drug content of all ME gel formulation was found to be 94-104%.[33]

Determination of pH

The pH values of microemulsions were varied from the range 6.09 to 6.34 which lies in the normal pH range of the skin.[34]

Spredability study

The Spreadability numbers suggested that the emulgel could be easily distributed with a minimal degree of shear. The spreadability of the gel is critical for patient compliance and aids in uniform application of the gel to the skin. A good gel will spread quickly and have a wide spreadability. ME gels prepared with low concentration of carbopol F1 belonged to fluid gel category, having more spreadability values. The stiff and semi stiff formulations were made with increasing concentrations of carbopol and xanthan gum, while the formulations F3 and F6 made with 1.5 g of carbopol were stiff and semi stiff. 1.5 g xanthan gum was classified as very stiff. The spreadability of formulations reduces as the concentration of gelling ingredient in the formulation increases.

Table 5: Spreadability studies.

Formulation Code	Drug content	pH	Spreadability gm.cm/sec
F1	102±0.14	6.1±0.69	1.06±0.2
F2	99±0.75	6.09±0.70	0.83±0.1
F3	103±0.25	6.11±0.57	0.56±0.12
F4	102±0.14	6.34±0.28	0.81±0.13
F5	100±0.15	6.19±0.35	0.76±0.17
F6	98±1.86	6.31±0.19	0.63±0.2
F7	101±0.12	6.14±0.29	0.96±0.14
F8	94±0.54	6.10±0.66	0.85±0.16
F9	99±0.6	6.12±0.48	0.96±0.10

Viscosity study

The viscosity results helped to understand the influence of various formulation parameters on consistency, spreadability and drug release. Generally consistency of formulations depends on the ratio of solid fraction to liquid fraction which produces structure.

The viscosities of ME based gels of itraconazole at low and high shear rate are given in table. Formulation containing CBP (F1-F3) exhibited high viscosity than other formulations. This is due to difference in the type of gelling agent which results in changing the structure consistency and low hygroscopicity of XG and mixture of polymers (CBP:XG), (CBP:CMC), (CBP:CMTG) (1:1) ratio as compared to CBP 934. Shear thinning was observed in all created formulations, as the viscosity was found to be reduced as the shear rate was increased (Table). Shear thinning occurs when shear is applied and the structure begins to break down when the sites of contact are disturbed and the polymeric chain aligns.Shear thinning

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

behaviour is a desirable property for the topically applied preparations. Since, all prepared formulations showed pseudoplastic behaviour indicates good spreadability.

Table 6: Viscosities of ME based gels of itraconazole.

Formulation code	η* max (cP)	η** min (cP)
F1	350.47	224.36
F2	1588.24	680.96
F3	1493.45	418.39
F4	58.67	15.6
F5	1063.92	223.44
F6	1543.49	304.62

F9	776.43	292.85

*Viscosity at high shear rate (100 rpm); **Viscosity at low shear rate (11.5 rpm).

In vitro drug release

All the batches of itraconazole ME gels showed drug diffusion within the range of 58.57±1.48% to 96.66±1.89% at the end of 6h.

The (CBP: CMTG) (1:1) containing gels showed maximum 96.66±1.89% drug release at the end of 6h. (CBP: CMTG) (1:1) gels exhibited higher drug release in comparison with gels formulated with CBP, XG and mixture of polymers (CBP: XG), (CBP: CMC) (1:1) ratio. As the concentration of CBP was increased in formulations (F1-F3) drug release was found to be decreased. This may be attributed to increased viscosity of carbopol gels.

Due to the difference in viscosity of the polymers, when the concentration of gelling agents in formulations increases, the diffusion of formulations reduces.

The in-vitro release of prepared formulation compared with marketed formulation (Itratrox gel 1% w/w). From the comparison it was observed that formulation F9 shows 96.66±1.89% drug release at the end of 6h and marketed Itratrox gel (1% w/w) shows 90.56±1.75% drug release at the end of 6h. From the result it was observed that ITZ ME gel of F9 batch shows more drug release compared to the marketed formulation.

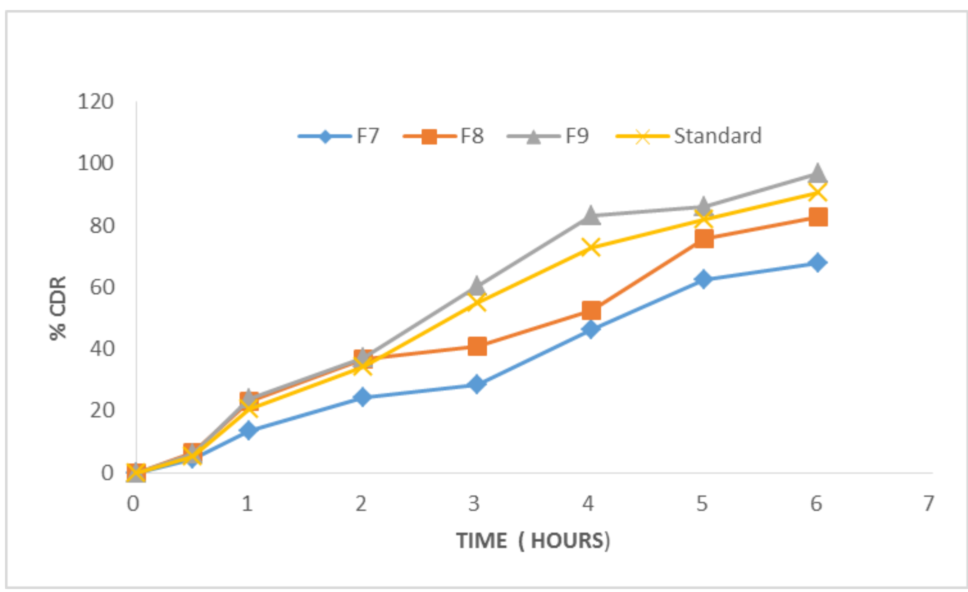

Figure 8: Percentage Drug Release of Formulations in Phosphate Buffer (Ph 7.4) for Formulation batch F7-F9.

4. CONCLUSION

ME gel produced with oil (5%), S/Cos (45%), water (50%) and (CBP: CMTG) (1:1) outperformed all other formulations in terms of overall formulation quality. Developed microemulsion system provides solubilization of hydrophobic drug, thus impart availability of itraconazole in formulation, where as globule size and zeta potential was 885.5dnm and-0.118, respectively, indicating the stability and proper formulation of microemulsion. The prepared ME gel can be considered as cost effective formulation because of reduction of topical dose of itraconazole in formulation. The F9 batch had the highest release (96.66±1.89). The prepared microemulsion gel show better release profile than marketed preparation. Furthermore, they were shown to have a better permeation and look.. It was a shear thinning system because all formulations exhibited non-Newtonian pseudoplastic behaviour. Thus, the results of this research study clearly indicated a promising potential of the itraconazole ME gel as an alternative to the conventional dosage forms.So itraconazole ME gel can be used as an anti- fungal agent for topical drug delivery.

A B S T R A C T

Objective: To Evaluvate of Antiepileptic Acivity of Ficus Racemosa Extract Against Chemicals Induced epilepsy in mice, ficusracemosa is also used as antihyperglycemic, antiinflammatery , hepatoprotective action. **Method :** Anticonvulsant activity of three distinct dose levels of ethanolic extract of Ficus racemosa (100, 200, and 400 mg/kg) was tested in Swiss albino mice in seizures induced by Pentylenetetrazol (PTZ). Statistical analysis was carried out by one-way analysis of variance followed by Dunnett's test. **Results**: The presence of , flavonoids, were detected in the bark of Ficus racemosa. The extract dose-dependent effect in the delay of the onset of seizures and reduction in the duration of seizure. **Conclusion :** The ethanolic extract of Ficus racemosa exhibited significant and dose-dependent antiepileptic activity, which may be due to the presence of antioxidant principles like flavanoidsa nd other phytoconstituent produce protective activity against PTZ.

Keywords: Pentelynetetrazole, Anticonvulsant activity, diazepam, *Ficus racemosa* bark.

INTRODUCTION:

Epilepsy is a chronic disorder of central nervous system, Epilepsy are disorders characterized by paroxysmal, abnormal, excessive or synchronous neuronal activity in the brain with 5-10% of the population. There are many antiepileptic agents available for treatment but associated with side-effects such as depression, ischemia, impaired cognition and motor disability. This made man to search for alternative medicine from natural source.

Medicinal plants used for the therapy of epilepsy in traditional medicine have been shown to anticonvulsant activities. which can be much cheaper and less time-consuming. Several useful medicines derived from plants have been discovered from scientific investigation of traditional claim.

Ficus racemosa is also known as F. Glomerata. Ficus racemosa has various synonyms like Udumbara (U gular, etc. It is used in treatment of burning sensation and obesity, anti-ulcer antipyretic antidiabetic diuretic, like astringent, and useful in vaginaldisorder Epilepsy is the term used for a group of disorders characterized by recurrent spontaneous seizures and involves hyperexcitable neurons. It is assumed that there is an imbalance between inhibitory GABA-mediated and excitatory glutamate-mediated neurotransmission. It is commonly associated with the brain.

The seizure activity during epilepsy decreases the antioxidant defense mechanism in the brain and increases the amount of free radicals, which further induces the oxidative stress. Free radicals (FR) can be defined as molecules or molecular fragments that contain one or more unpaired electrons. These free radicals were involved in causation of lipid peroxidation, brain edema and epilepsy.

Material and Methods:

Drug andchemicals

The standard drugs of Diazepam were obtain form (Ranbaxy), Pentylenetetrazole obtained from (OZONE® INTERNATIONAL (INDIA) , All other chemicals used were of analytical grade.

Plant collection:

The bark of ficusracemosa plant were collected and shade dried and made in coarse powder

After collection Ficus racemosa bark were cleaned, washed to remove any dirt, dust and foreign particles. Botanical identity of plant specimen was authenticated by Dr. S. A. Mohite, Head, Department of Botany, Lal Bahadur Shastri College, Satara (MS), India. A voucher specimen of the bark has been deposited in the department for future reference .The bark were coarsely powdered and further utilized for preparation of ethanol extract.

Plant Extraction:

The ethanol extraction of bark of Ficus racemosa was carried out by soxhlet apparatus. The bark were crushed and ground to powder and placed into extractor. The ethanol was poured on powder with three cycles. After that extraction process was started and continued till appearance of solvent in syphon tube turns brown to clear. Then brown colored solvent mixture from round bottom flask was collected and evaporated with the help of rotary evaporator to get a solid residue. The residue was placed in a vacuum desiccator and was further used for the experiments.

Pharmacological Investigation:

Experimental Animals: Adult Swiss albino mice (25-30 g) were used for this study. The animals were housed at 24°C ± 2°C and relative humidity 55 ± 5 with 12:12 h light and dark cycle. They were provided food and water *ad libitum*. The experimental protocol was approved by the Institutional Animals Ethics Committee of Yashoda College of Pharmacy, Satara , Maharashtra.

Acute toxicity study:

The acute oral toxicity was performed as per the Organization for economic co- operation and development (OECD) guideline 423.[14]Acute toxicity study was performed in Swiss albino mice. The animals were grouped with three numbers in each were administered orally with the ethonolic extract of Ficus racemosa was given to animals with starting dose 300mg/kg in 0.1% CMC for first According to observations of first group, study was carried out further on next group with dose 2000 mg/kg. From obtained results it was clear that no death as well as no toxicological signs in animals so, for confirmation of safety of extract study was repeated with dose 2000mg/kg on third group. After administration of extract, animals were observed carefully for first 30 min and periodically for 24 h with special attention during first four hours. Animals were further observed daily for subsequent 14 days. Effects such as changes in skin fur, eyes and mucous membranes were observed daily. Animals were further observed for salivation, diarrhea, tremors, lethargy, convulsions, sleep, and coma. The parameters like body weight, food, and water intake were checked periodically every two days[20].

Evaluation of antiepileptic activity:

PTZ-induced convulsions in mice

Swiss mice of either sex were randomly divided in to Five different groups of six mice each. Group I received the vehicle, Group II received the standard drug, Diazepam at the dose of 5 mg/kg, i.p. Group III, IV and V received EEFR at the doses of 100, 200 and 400 mg/kg, p.o. respectively. Group I mice were administered with PTZ (80mg/kg, i.p.) 1 h after vehicle. Group

II mice received PTZ 30 min after Diazepam (5 mg/kg, i.p.). Group III,IV and V mice received different doses of plant extracts, p.o. 1 h before PTZ. Onset time as well as duration of convulsions were recorded [12].

Statistical analysis

The data were analyzed using one-way analysis of variance, followed by Dunnett's test. $P < 0.05$ was considered as sta1tistically significant. The data are expressed as mean ± standard deviation.

RESULT:

Preliminary phytochemicalinvestigation

Table 1.Shows the findings of qualitative analysis of Preliminary phytochemical screening of Ethanolic extract of ficusracemosa bark indicated the presence of steroids, triterpenoids, polyphenolics, coumarins, flavonoids and tannins, while alkaloids and saponins were absent.

PHARMACOLOGICAL INVESTIGATIONS

Acute toxicitystudy

The acute toxicity study began with a 300mg/kg starting dose. During a 14-day observation period, oral administration of a 300 mg/kg dosage of ethanol extract of *ficus racemosa bark* caused no significant toxicity.

DIRECTOR Yashoda Technical Campus Satara

From above results it is clear that given dose was safe and hence further study was performed by administering 2000mg/kg dose of extract to next group of animals. There were no indicators of toxicity and mortality [Table 2.], as well as the animals' morphological characteristics and general appearance did not change. There was no salivation, diarrhoea, tremors, convulsions, lethargy or unusual behavior observed during study in treatment group. For further confirmation of results effect was checked by giving same dose (2000mg/kg) to another group of three animals and results parameters were normal. The oral LD50could be over 2000mg/kg body weight. As a result, greater dose testing of the extracts may not be necessary, and the extracts were practically non-toxic.

Table 2: Effect of *Ficus racemosa bark* extract for sign of toxicity and mortality (n = 3).

Group	Treatment	Sign of toxicity (ST/NB)	Mortality (D/S)
Normal Control	Vehicle	0/3	0/3

PTZ induced Epilepsy

The average time of onset, duration of convulsions and percentages of inhibition of convulsions were presented in table. 3 EEFR treated mice not only exhibited delay in the onset time of convulsions at the doses of 100, 200 and 400 mg/kg, p.o. but also showed reduced duration of convulsions when compared with the control group mice. All the three doses of EEFR afforded significant protection in a dose-dependent manner against convulsions induced by PTZ ($P < 0.01$). Animals pretreated with EEFR at all the three doses exhibited significant antiepileptic activity and more percentage of inhibition of convulsions when compared with Diazepam treated animals.

Table 3: Anticonvulsant effect ethanolic extracts of Ficus racemosa on PTZ-induced convulsions in mice.

Experimental Group	Dose	Onset of convulsion(min)	Duration of convulsion(min)	Mortility	% Protection
Control	Vehicle	1.05.±0.12	.4.30 ± 0.20	6/6	0%
Standard (Diazepam)	5mg/kg	0.000.±0.00	0.00.±0.00**	0/6	100%
EEFR	100mg/kg	2.5.±0.17	2.9 ±0.40	4/6	33.33%
EEFR	200 mg /kg	3.1.±0.22	1.8± 0.03	3/6	50%
EEFR	400mg /kg	4.5.±0.25	1.2.± 0.004	2/6	66.66%

DISCUSSION:

Epilepsy is one of the chronic and most common neurological disorders. The basic and major mechanisms associated with epilepsy are increased synaptic connectivity of neurons (such as excitatory glutaminergic neurons), (weakening of potassium channels and/or inure persistent sodium channels, changes in voltage-gated ion channels), perturbance in synaptic receptors (suppressed GABAergic receptor altered nicotinic receptors), decrease in inhibitory neurotransmission (decreased GABA levels), enhanced excitatory neurotransmission (enhanced glutamate levels. [29]

In this study, anticonvulsant activity of bark extracts of Ficus racemosa PTZ-induced convulsions in Swiss albino mice.

PTZ is a potent GABA receptor antagonist, it is well known to decrease the GABA levels, and density of GABA A receptors in various parts of the brain, this leads to continuous stimulation of cortical neurons and results in convulsions similar to absence seizures is human Hence, if thought that the agents which enhance GABA levels, GABA-A receptor agonists (like diazepam), the agents behave like GARBA are thought to be useful in abolishing PTZ-induced convulsions [6].

The reports on chemical constituents of EEFR have shown the presence of antioxidant and chemopreventive principles namely, racemosic acid, bergenin, tannins, kaempferol, rutin, bergapten, psoralenes, coumarin and phenolic glycosides antioxidant used in Parkinson's ,epilepsy, Alzheimer [26][1] .

PTZ-induced convulsions in mice are a suitable model for petit mal epilepsy. PTZ is GABA antagonist. This assay has been used primarily to evaluate AED. Drugs which antagonize PTZ- induced seizures are generally useful in petit mal epilepsy. It has been indicated that PTZ- induced seizures can be prevented by drugs that reduce T-type Ca^{2+} currents, such as ethosuximide and also by drugs that enhance GABAA receptor-mediated inhibitory neurotransmission, such as benzodizepine .

It is also found that many flavonoids could act as benzodiazepine-like molecules in the central nervous system and modulate GABA-generated chloride currents in animal models of anxiety, sedation and convulsion [34][4].

The average time of onset, duration of convulsions and percentages of inhibition of convulsions were presented in EEFR treated mice not only exhibited delay in the onset time of convulsions at the doses of 100, 200 and 400 mg/kg, p.o. but also showed reduced duration of convulsions when compared with the control group mice. All the three doses of EEFR afforded significant protection in a dose-dependent manner against convulsions induced by PTZ ($P < 0.01$). Animals pretreated with EEFR at all the three doses exhibited significant antiepileptic activity and more percentage of inhibition of convulsions when compared with Diazepam treated animals. convulsion were induced the all animals by given PTZ 80 mg/kg i.p. 100% mortality was observed in control groups. Diazepam at the dose of 5 mg/kg p.o. significantly delayed onset of convulsion and decreased duration of convulsion and also delayed onset of convulsions and decreased duration of convulsions and also prototected 100% mortality rate.

CONCLUSION:

Based on the above investigations, it may be concluded that the ethanolic extract of bark of ficusracemos *a* exhibited significant antiepileptic activity. The presence of flavanoids may partially contribute the significant

1202

activity of EEFR by enhanced GABAergic neurotransmission which responsible for the antiepileptic effect.

A B S T R A C T

Polycystic ovarian syndrome (PCOS) related infertility is a global problem that is spreading at an alarming rate. Chronic anovulation, polycystic ovaries, and hyperandrogenism, as well as abnormal menstrual cycles, hirsutism, acne, and infertility, are all symptoms of this condition. PCOS is linked to insulin resistance and elevated levels of male hormones (androgens). Among other things, an inactive lifestyle, a lack of exercise, dietary changes, and stress are all contributing factors. Curcuma longa, Aloe barbadensis**,** Mentha piperita, Allium fistulosum Cinnamonum zeylanicum, and other plants have been shown to be effective in the treatment of PCOS. The aim of this review is to summarise the most effective medicinal plants that are used in the treatment or prevention of PCOS. Special emphasis is placed on the role of insulin resistance and the possible utility of insulin sensitizers in the treatment of PCOS.

Keywords- Polycystic ovarian syndrome (PCOS), Screening methods of pcos, Pathophysiology of pcos.

INTRODUCTION

Leventhal and Stein in 1935 first defined a disorder, which would ultimately become known as polycystic ovary (or ovarian) syndrome (PCOS)[1]. Polycystic ovary syndrome (PCOS), a unitization of symptoms, which affects women of child-bearing age is assumptive in epidemic proportions. A resultant of imbalance in proportion of female sex hormones, results in cysts within antral follicles of ovaries. Once multiple cysts are formed in the ovarian follicles because of the hormonal imbalance, it is characterized as PCOS. Anovulation and absence of menstrual cycle prevents fertilization, and conception in women, thus pregnancy becomes troublesome[2]. PCOS affects 6–10% of women throughout the globe. According to 1990 NIH criteria 7–12 and even more individuals. According to the broader Rotterdam criteria, which makes it one of the most common human disorders and the single most common endocrinopathy in women of reproductive age.[3] The oxidative stress (OS), that will increases in inflammation, which also been reported as possible cause of PCOS[4]. Women with PCOS has several risk factors which are associated with the development of uterine cancer including fatness, hyperinsulinemia, diabetes mellitus and abnormal uterine bleeding.[5] The frequency of depression and anxiety is higher in women with PCOS than in the general population. Mood disorders are capable of impairing quality of life, which are well-known in young adult women, concerned with fertility, and in women of all ages with respect to obesity, and clinical manifestations of excessive androgen.[8]

RISK FACTORS[6]

- Obesity
- Family history of Infertility
- Family history of PCOS
- Family history of diabetes
- Fast food diet habits
- Lack of physical exercise

PATHOPHYSIOLOGY OF PCOS[7]

The pituitary gonadotropin is fundamental to reproductive function-its production and secretion of FSH and LH is directly stimulated by hypothalamic GnRH and it is also influenced by integrated feedback mechanisms. The initial stimulus for follicular development and also granulosa cell conversion of androgens to oestrogens by stimulating the aromatase enzymes is provided by FSH. Luteinizing Hormone(LH) characteristically known for its role in the luteal phase by promoting secretion of progesterone, also it has a vital role in the follicular phase, for inducing thecal androgen production. Women with PCOS often secrete more LH and this might result in higher theca cell androgen secretion. to maintain gonadotropin secretion pulsatile GnRH stimulation is required, but the continuous exposure of the pituitary to GnRH causes desensitisation and a suppression of gonadotropin secretion. Due to Changes in the pulsatility of GnRH alter the ratio of secretion of the two pituitary gonadotropins throughout the menstrual cycle.[7]Excessive androgen in PCOS is related with increase in abdominal fat leads to dyslipidemia and hyperinsulinemia. Thus, hyperinsulinemia reduces hepatic sex hormone-binding globulin(SHBG) to increase circulating bioactive testosterone levels.[8]

Screening Methods of PCOS

Androgen Induced PCOS Model[9]:

Hyperandrogenism is the most common symptom of PCOS. One of the etiologic hypotheses for PCOS is that early life exposure to excessive androgens leads to PCOS later in life. Increased levels of circulating androgens in the rodent affected ovarian follicular maturation and cyst development, according to a study published more than 30 years ago. Several androgens, including dehydroepiandrosterone (DHEA), testosterone propionate (TP), and 5a-dihydrotestoterone, have been used to induce an acute PCOS condition in rats through regular injection or subcutaneous implants (DHT). However, there is still some inconsistency in the reporting of endocrine hormones and ovarian histology in different models. Furthermore, some studies did not look at cardiometabolic parameters or the effects of daily androgen injections and/or treatment on physiologic indices like body weight, stress indicators, or food intake. The pathological induction of PCOS in these rodent models is transient and dependent on androgen treatment. As a result, natural reproductive/ovarian cycling happens again after androgen administration is stopped.

DHEA Induced PCOS[9]:

The first androgen to increase in the female peripubertal cycle is dehydroepiandrosterone. Nearly half of follicular synthesised T can be obtained from circulating DHEA, and 25% of PCOS patients have higher-than-normal circulating DHEA levels. Roy et al. were the first to use dehydroepiandrosterone to induce PCOS in rats. DHEA (6 mg/100 g body weight, dissolved in 0.2 mL sesame oil) is injected daily for up to 20–27 days into prepubertal rats, typically aged 22 days. Rats become acyclic and anovulatory after treatment

Ovarian Morphology: Multiple follicular cysts varying in size from 0.45 to 2.2 mm in diameter, as well as degeneration of granulosa cell layers, grow in dehydroepiandrosterone-induced rats. The ovarian tunica capsule is not thickened, and the ovarian weight of DHEA-treated rats is substantially increased.

***Endocrine hormone profile*:** DHEA-induced rats have significantly higher serum DHEA, T, E2, FSH, LH, and PRL concentrations than control rats, while no changes in plasma FSH and LH concentrations have been identified by other groups. Fasting serum glucose and insulin concentrations were higher in DHEA-induced rats, indicating cardiometabolic abnormalities.

Early DHEA-related hyperandrogenemia, anovulation, cystic ovaries, and the production of insulin glucose metabolism abnormalities can all be detected using the DHEA-induced model.

TP- *Summary*: Induced PCOS Model[10]:

Testosterone propionate (TP) can cause hyperandrogenemia in rats when given prenatally or postnatally. Furthermore, prenatal T exposure during the crucial time of foetal development has been linked to reproductive system developmental and morphological abnormalities. Pregnant rats were given a single dose injection of T on gestational day 20 or T propionate (TP) from days 16 to 19 (3 mg T daily) of pregnancy for prenatal administration. Rats were given TP at a dose of 1.25 mg/100 g body weight at 5 days of age, or daily injections of 1 mg/100 g body weight from 21 to 56 days of age.

Estrous cyclicity: T prenatally treated rats had longer and more irregular estrous periods. Estrous cyclicity was disrupted and diestrus phase was persistent in postnatally treated rats.

Ovarian morphology: In the ovaries of rats treated prenatally with T, the number of preantral and antral follicles increased, whereas the number of pre-ovulatory follicles and corpus luteum (CL) cells decreased, as opposed to control rats. In prenatal T-treated rats, cystic follicles were also discovered. Rats given T postnatally, on the other hand, had massive cystic or atretic follicles and luteinization of theca cells in the ovaries. When postnatal T treated rats were fed a high fat diet, their body weight increased while their fasting glucose levels remained unchanged.

Summary: The ovary of rats treated with postnatal T showed morphological changes that mirrored the human PCOS phenotype. Prenatal T therapy, on the other hand, increased the number of preantral and antral follicles in rats, despite the fact that cystic follicles and ovary weight were unchanged in this model, and the reported changes did not match the ovarian morphology of people with PCOS. Both prenatal and postnatal T therapy increased serum T levels. Prenatal T administration had no effect on serum E2 and P4 levels, while continuous postnatal T treatment increased E2 levels, likely due to T conversion. An increased number of kisspeptin-positive cells in the ARC of

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

prenatal T-treated ewes may be linked to defects in GnRH/LH secretion feedback control 11; however, one drawback of this study is that LH levels and ovarian morphology were not examined..

DHT induced PCOS models[10]:

Since DHT is not converted to E2 by aromatase, the PCOS phenotype in DHT-treated animals can be studied without taking into account the effects of oestrogen derived from androgens.

Prenatal DHT treated models:

Mice were injected with 250 g of DHT on days 16, 17, and 18 of gestation 28 to generate prenatal DHT-treated animals, while rats were given 3 mg of DHT daily from gestational day 16 to 19. The offspring were used as PCOS models that had been prenatally treated with DHT.

Estrous cyclicity: Prenatally administered DHT caused irregular cycles in rats and mice. The mice spent more days in diestrus and fewer days in proestrus than controls, resulting in fewer litters being produced every three months.

Ovarian morphology: Prenatal DHT treatment resulted in fewer normal large, antral, preovulatory follicles and CLs, as well as more atretic cyst like follicles. In prenatal DHT treated mice, CL and antral follicle wall areas were reduced, but the number of atretic cyst like follicles and the thickness of the antral follicle theca cell layer increased.

Neuropeptides in the hypothalamus: The number of kisspeptin and NKB positive cells in the ARC of the hypothalamus increased significantly in prenatal DHT treated rats, whereas the number of kisspeptin positive cells in the AVPV did not differ from that of control animals in diestrus. The input of aminobutyric acid (GABA) to GnRH-expressing neurons was increased in mice given DHT prenatally, according to a recent study.

Metabolic features and adiposity: Prenatal DHT-treated rats and mice had body weights that were close to control animals. Prenatal DHT therapy, on the other hand, increased adipocyte region in parametrial fat and the degree compared to the control group.

DHT prenatally treated rats and mice had abnormal estrous cycles and ovarian morphology similar to PCO. In prenatal ***Summary:*** DHT-treated rodents, increased LH levels were observed, along with an up regulation of kisspeptin in the ARC. There was no discernible difference in body weight, on the other side. This phenotype is similar to PCOS, which is marked by normal body weight and increased LH secretion.

Letrozole-Induced (Aromatase Inhibitor) Rodent Model of PCOS[11] :

Abnormal follicular development and polycystic ovary may result from intraovarian androgen excess caused by circulating hyperandrogenemia or abnormal steroidogenesis. P450 aromatase, which was expressed in the placenta, ovary, and testis as well as a wide variety of human tissues, converted testosterone and androstenedione into estradiol and estrone, respectively; a decrease in the enzyme's activity could result in increased ovarian androgen production and the development of PCOS. Aromatase is the key enzyme that converts T and androstenedione into E2 and estrone, respectively. It is widely expressed in human tissues, such as placenta, ovary, and testis. Reduced aromatase activity in the ovary is one of the pathophysiologic hypotheses of PCOS development. Letrozole is a nonsteroidal aromatase inhibitor that reduces conversion of androgens to estrogens in the ovary, resulting in increased T and decreased E2 production. Excess T in the ovaries is likely to cause polycystic ovaries directly in Letrozole-treated rats. The reduction in estrogen weakens the negative feedback on LH production in the pituitary, resulting in increased LH levels, which further stimulates theca cells to secrete T. Typically, 6-week-old female rats (puberty) are administered Letrozole orally at doses of 0.1, 0.5, and 1.0 mg/kg daily for 21 days, after which they become acyclic, with histological and biochemical features of human PCOS.

Estrous cyclicity: Regular vaginal smear examinations were used to monitor estrus cycles. In the analysis, only animals with two consecutive standard 4-day periods were used. The rats and mice treated with letrozole were fully acyclic. This rat model's vaginal smears showed an excess of leukocytes, the diestrus phase's predominant cell type.

Ovarian morphology: Ovaries from control group exhibited follicles in various stages of development including secondary follicles, graffian follicles, and fresh corpora lutea. In study groups, letrozole inhibited growth of follicles in a dose-dependent manner. Small follicles could be observed in early development, in addition to follicles showing evidence of atresia, and many large cysts with virtually no granulosa cell layer or large cystic follicles with scant granulosa cells. Ovaries from the sample groups had a higher rate of subcapsular ovarian cysts and capsular thickening than the control group. together with incomplete luteinization and a dose-dependent decrease in the amount of corpora lutea In some of the research classes, there was also evidence of theca cell hyperplasia..

Summary: Acyclicity, cystic ovarian morphology, elevated serum LH levels, and higher Kiss1 mRNA expression in the posterior hypothalamus are all observed in letrozole-induced PCOS model rats compared to control rats. This model accurately reproduces the metabolic characteristics of human PCOS, including a PCO-like morphology and elevated serum LH levels, and is thus suitable for studying human PCOS. Increased KNDy neuron activity was linked to a reduction in the negative feedback effect of sex steroid hormones, as evidenced by increased Kiss1 mRNA and serum LH levels.

Medicinal plants of natural origin-

Curcuma Longa (Turmeric) ***[12]:***Curcumin is a water-insoluble polyphenolic curcuminoid derivative found in the rhizomes of Curcuma longa, an Indian spice (turmeric). Turmeric is widely used in Asian cuisine as a food additive

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

and colouring agent, as well as in Indian herbal medicine. Curcumin makes up around 2–8% of all turmeric preparations. Curcumin has been shown to have a wide range of biological effects like Anti-inflammatory, antioxidant, hypoglycaemic, and antihyperlipidemic properties The study used virgin, cyclic, adult female Wistar Albino rats weighing 160–200 g. Once everyday for 21 days, followed by treatment with curcumin. Letrozole treatment resulted in abnormalities in the serum sex steroid profile, lipid profile, glucose, and glycosylated haemoglobin levels and antioxidant activity has been depleted. Whereas Curcumin was able to exert its calming effect by returning all parameters to normal and causing cysts in the ovaries to vanish. Curcumin, like Clomiphene citrate, has a number of beneficial effects in the treatment of PCOS.

Aloe barbadensis (Aloe)[13]:Aloe barbadensis Mill. (Liliaceae) is a well-known plant with such properties. Polyphenols, sterols, flavanoids, and other nutrients were analysed qualitatively and quantitatively for polyphenols, sterols, flavanoids, and other nutrients in the Aloe vera gel formulation. To induce PCOS, five-month-old Charles Foster female rats were orally fed letrozole, a non-steroidal aromatase inhibitor. The rats were then given the Aloe vera gel formulation orally.AVG treatment of PCO rats resulted in a reduction in ovary atretic cysts as compared to PCOS controls, according to histological review. By restoring ovarian steroid status and modifying main steroidogenic behaviour, aloe vera gel formulation protects against the PCOS phenotype.

Glycyrrhiza glabra (liquorice)[14]: Traditional medicine has used liquorice (Glycyrrhiza glabra of the Leguminosae family) to treat a variety of ailments. Antifungal, antiviral, antibacterial, and antihyperglycemic properties are all present in it. The most bioactive compound in liquorice is glycyrrhizic acid. Phytoestrogens found in liquorice include liquiritigenin, liquiritin, isoliquiritin, isoliquiritigenin, glabidin, and glabrene. The effects of two natural compounds derived from liquorice root on vascular tissues in vitro and in vivo were reported: glabridin, the main glabrene, and isoflavane, an isoflavene, both demonstrated estrogen-like activities. One of the bioactive compounds responsible for weight loss may be liquiritigenin, a selective oestrogen receptor ligand. Some molecules, such as glabrene and glabridin, have been shown to reduce weight in vivo. It has also been documented that treating hirsute women with a combination of spironolactone and liquorice may help with PCOS by reducing the volume depletion caused by spiranolactone and possibly increasing its anti-androgenic activity.

Mentha piperita(Peppermint) [15]:Peppermint (Mentha piperita L.) is a member of the Labiatae family that originated in the Mediterranean region and is now widely cultivated all over the world. Antioxidant, antitumor, antiallergenic, anti-inflammatory, antiviral, antibacterial, and antifungal properties are all present in peppermint. It also has anti-androgenic properties, lowering the level of free testosterone in the blood after three weeks of treatment with letrozole and peppermint. Females with PCOS had significant changes in serum testosterone, oestrogen, LH, and FSH function. Ovarian cysts with a reduced granulosa layer, atretic follicles, and a small number of corpora lutea were found in the PCOS community. Peppermint was found to have a strong potential as an alternative therapy in the treatment of PCOS, as shown by necrosis in stromal mesenchymal cells, hyperplasia of luminal epithelial cells, and necrosis in stromal mesenchymal cells.

Allium fistulosum (Onion)[16]: In Asian countries, the Welsh onion (Allium fistulosum) is well-known for its use in food and traditional medicine. For treatment, administered AF extract to letrozole-treated rats for 2 weeks. In terms of serum hormonal levels, the LH/FSH ratio and serum oestrogen levels were positively affected by AF extract therapy. FSH and LH are necessary for ovulation, and PCOS patients often have a two- to three-fold increased LH/FSH ratio, which is enough to cause ovulation disruption. The findings suggest that AF extract normalises follicular growth and ovarian cysts. In the letrozole-induced PCOS rat model, the steroid hormone-related receptors demonstrated restoration of m-RNA expression after treatment with AF extract A. fistulosum extract treatment relieved hormonal imbalance and altered ovarian function.

Linum usittassimum (Flaxseed)[17]: Flaxseed is made from Linum usittassimum (Linaceae), an omega-3 fatty acid-rich food that is also one of the best sources of dietary lignin. ALA, lignans (secoisolariciresinol diglycoside-SDG), and soluble flaxseed fibre mucilage (d-Xylose, L-Galactose, L-Rhamnose, d-galacturonic acid) are all biologically active compounds with major health benefits. Flaxseed or isolated lignan has been shown in studies to lower androgen levels while also normalising lipid levels. Lignans seem to minimise excess testosterone, which is a crucial factor in the development of PCOS. Flaxseed supplementation can help women with PCOS control androgen levels, according to a case study. The study found a substantial reduction in androgen levels. There was also a decrease in hirsutism. Flaxseed can have a significant effect on testosterone levels, as well as symptoms associated with hyperandrogenism, such as hirsutism, according to the findings. Another research looked at the impact of flax seeds on ovarian morphology in PCOS patients, finding that flax seed supplementation decreased ovarian volume, increased the amount of follicles in the ovaries, and improved menstrual cycle duration. However, hirsutism, blood sugar levels, or body weight did not improve as a result of the research.

Panax ginseng (Ginseng)[18]: Herbal medication is made from the roots of Panax ginseng (Araliaceae). It has anti-aging properties and is used as a tonic. Ginseng saponins are ginseng's active ingredient. Rb1, Rb2, Rc, Rd, Re, Ro, Ra, and minor ginsenosides make up these ginsenosides. It can be used as a dietary supplement. Estradiol valerate induced polycystic ovary in rats. The ovarian morphology was examined in this analysis. The ginseng-containing formulation is known as Kampo preparations**.** It is formulation significantly decreases the plasma LH levels

6757 YASHODA TECHNICAL CAMPUS SATARA
DIRECTOR
Yashoda Technical Campus
Satara

and thereby it is effective in improving endocrine condition in the treatment of disturbances of ovulation in patients with PCOS.

Tribulus terrestris (Puncture vine)[19]: Puncture vine or Devil's eyelashes, Tribulus terrestris (Zygophyllaceae), plays an important role in traditional medicine. The herb Tribulus terrestris has been shown to help with polycystic ovarian syndrome. Tribulus terrestris extract was found to be successful in improving ovulation in rats with polycystic ovaries induced with estradiol valerate in a study. The extract treatment improved ovarian follicular development and normalised estrous cyclicity and steroidal hormone levels. Many herbalists believe that tribulus is an excellent overall ovarian stimulant and female fertility tonic for women with polycystic ovary syndrome.

Gymnema sylvestre (Gymnema)[20]: Gymnema sylvestre (Asclepiadaceae) is an Ayurvedic herb that has been used for thousands of years. It has a wide range of pharmacological effects, including anti-diabetic, hypoglycemic, and lipid-lowering properties. Saponins, especially gymnemic acids, are the active constituents in gymnema. Gymnema has been shown to have hypoglycemic properties in diabetic animal models. It keeps blood glucose levels in check. Metformin therapy is a convenient way to treat PCOS. Gymnema can thus be used to treat the root cause of insulin resistance. Gymnema is a good choice for PCOS because of its insulin-modulating properties and the added advantage of lowering the high triglycerides that come with the condition.

Punica granatum (Pomegranate)[21]: Pomegranate (Punica granatum of the Punicaceae family) is a fruit with a wide range of medicinal properties. Folic acid, vitamins (B2, C, B1), carbohydrates, pantothenic acid, and organic acids are all contained in the fruit. Unsaturated and saturated fatty acids are said to be present in the crop. In adult female rats, the effect of pomegranate extract in the control or management of PCOS was studied using a control and a PCOS community. The levels of free testosterone, serum oestrogen, and andrestandoin hormone were measured in the experimental community. Pomegranate extract seems to have a protective impact on polycystic ovarian syndrome hormonal imbalances, according to the report. The extract's phenolic compounds and phytosterols have been shown to help alleviate PCOS complications. Consumption of the extract, according to the report, decreases the complications associated with PCOS.

Symplocos racemosa (Lodh Tree)[22]: Symplocos racemosa Roxb, a member of the Symplocaceae family, is a common Ayurvedic remedy for female problems. It's also known as Lodhra, and it's used as a single medication or in multi-component formulations and preparations in Indian medicine. In a Letrozole-induced female rat model, the anti-androgenic properties of S. racemosa were investigated in the treatment of PCOS. Treatment with Symplocos racemosa resulted in substantial improvements in oestrogen, testosterone, progesterone, and ovarian tissue levels. It improves fertility and prevents ovarian cell dysfunction in PCOS patients.

Cinnamomum zeylanicum (Cinnamon)[23]: Cinnamon (Cinnamomum zeylanicum of the Lauraceae family) is an insulin potentiator. Insulin-stimulated glucose uptake and glycogen synthesis are controlled by this compound. Fasting and oral glucose tolerance test values were assessed in fifteen women with PCOS in a pilot study. In women with PCOS, the cinnamon extract increased insulin sensitivity. Cinnamon extract contains polyphenols and procyanidins, which potentiate the insulin signalling pathway, resulting in a hypoglycemic impact. Cinnamon's function as an adjunctive therapy in the treatment of PCOS was identified in this research. Cinnamon's impact on menstrual cyclicity and metabolic dysfunction in women with PCOS was studied in another research. It was a 45-woman randomised controlled trial. Oral cinnamon supplements were given. Menstrual cyclicity, luteal phase, and progesterone levels were all tracked. Cinnamon supplementation increased menstrual cyclicity and was shown to be beneficial in the treatment of polycystic ovary syndrome.

Vitex Negundo(Chaste Tree)[24]:Vitex negundo is a plant belonging to the (Linn) Verbenaceae family, genus Vitex, and species negundo. It's the five-leaved chaste flower, also known as monk's pepper. It has been documented to have anti-inflammatory, analgesic, antioxidant, antifungal, antiviral, and anti-inflammatory properties, as well as being used in gynaecological disorders. It also has anti-androgenic and estrogenic properties (linoleic acid-like estrogenic compounds). For the induction of PCOS, letrozole was given orally (p.o) for a duration of 21 days. The rats were then given extract of vitex negundo, which has positive effects on the ovary as well as effects on glucose tolerance, estrous cycle irregularities, LH: FSH ratio, steroidogenic enzymes, and cardiovascular parameters. It was able to successfully treat the rats with extract, which caused abnormalities in serum sex steroid profile, lipid profile, glucose, and estrous cycle. This may be attributed to the extract's phyto-components.

CONCLUSION:

The most common cause of menstrual irregularities and hyperandrogenism is polycystic ovary syndrome (PCOS). It is the most common cause of female infertility. Several risk factors for PCOS have been studied, including glucose intolerances, obesity, and dyslipidemia. Many treatments are currently available, but they are associated with moderate to serious side effects, and their high cost has led to a search for plant-based remedies to treat PCOS. In this study, summarize some of the most important medicinal plants for treating PCOS and helps with PCOD symptom relief and management. Hyperandrogenism, insulin sensitivity, fertility, and menstrual cyclicity are all aided by these plants.

Abstract

The aim of the present work is to establish three simple, economical and rapid methods for the quantification of Flecainide acetate in bulk drug and in tablets formulation. This study is designed to validate and developed spectroscopic and chromatographic methods as per ICH guidelines. In Method A, area under curve (AUC) of zero-order spectrum was recorded between 277.00 and 310.00nm. Linearity was found in the concentration range of 20-120µg/ml. In Method B, zero-order spectra were derivatized into first-order and the AUC was recorded between 280.00 and 310.20 nm. The linearity was found in the conc. range of 20-120µg/ml. In Method C, separation was achieved using RP-HPLC by gradient elution using a C18 Qualisil BDS (250mm×4.5mm×5µm) column, a mobile phase consisting of water: acetonitrile (60:40 v/v) with mobile phase pH adjusted with orthophosphoric acid (pH 3.0), a flow rate of 1.0ml/min and UV detection at 296nm. The linearity was obtained in the concentration range of 10-50µg/ml. The developed methods are validated successfully across various parameters in accordance with ICH guidelines. Thus, the proposed methods can be used for routine analysis of Flecainide acetate as it does not showed any interference of excipients when estimated in pharmaceutical formulations.

Keywords: Flecainide Acetate; Spectrophotometric; Chromatographic; Area Under Curve; Derivative-Spectrophotometry; Validation; ICH Guidelines

Abbreviations: AUC: Area under Curve; FA: Flecainide Acetate; LOQ: Limit of Quantification; LOD: Limit of Detection.

Introduction

Flecainide Acetate (FA) is chemically designated as N-(2-piperidinylmethyl)-2, 5-bis (2, 2, 2–trifluoroethoxy) benzamide acetate having molecular formula: $C_{19}H_{24}F_6N_2O_5$ with molecular weight: 474.4g/mol (Figure 1) [1]. It is a white solid powder with melting point 146-152°C [2]. It is an antiarrhythmic agent (class IC) causing a decreased in intra-cardiac conduction velocity in all parts of the heart [3]. It is used for the treatment of tachyarrhythmia, atrial fibrillation, supraventricular tachycardia and ventricular tachycardia by blocking Na+ current delayed rectifier K+ current [classified as a Na+ channel blocker drug] [4]. Flecainide also has local anesthetic effects. It selectively increases anterograde and retrograde accessory pathway refractoriness. The action of Flecainide in the heart prolongs the PR interval and widens the QRS complex. The effect on the JT interval is insignificant as Flecainide does not lengthen ventricular repolarization [5]. The drug is official in the European [6], British [7] and US pharmacopeias [8]. Several chromatographic methods have been reported in the literature for the determination of FA in its bulk powder, in pharmaceutical formulations or in the presence of its enantiomers, metabolites or other

Satara

antiarrhythmic drugs [4].

Figure 1: Chemical Structure of Flecainide Acetate.

Analysis part is an important for formulation development of any drug molecule. A suitable and validated method should be vacant for the drug delivery system for analysis of bulk drug and formulation [9]. The developed methods were validated for accuracy, precision, ruggedness, and sensitivity. Accordingly, the objective of this study was to develop and validate the simple spectrophotometric method for the estimation of FA in bulk and tablets as per ICH guidelines.

Experimental

Instrumentation

The Shimadzu double beam UV-VIS spectrophotometer with spectra manager software UV Probe 2.21 with 10mm quartz cells was used. The chromatographic separation was achieved by using Agilent system consisting photodiode array detector, C_{18} Qualisil BDS (250mm×4.5mm×5µm) column [10]. All weights were taken on an electronic balance (Model Shimadzu AUX 120).

Chemicals

The gift sample of FA was obtained from Indeus Life Sciences Pvt. Ltd, Mumbai. Analytical grade solvents and reagents were purchased from Merck specialties Pvt. Ltd. Mumbai (India). Double distilled water filtered through the membrane filter was used. Flecarite tablets each containing 100mg of active drug were purchased from the local market.

Preparation of Standard Stock Solution

The standard stock solution was prepared by dissolving 10mg of FA in the 100ml of water, sonicated and to obtain the concentration of 100µg/ml.

Method A: Area under Curve Zero Order UV Spectrophotometric Method: Concentration of 10µg/ml was prepared by diluting 1ml of standard stock solution with 10ml of water. This solution was scanned in the UV-visible range 400-200nm. FA showed the maximum absorbance at 296 nm as shown in and the AUC of the zero order spectrums was recorded between the 277.00-310.00nm (Figure 2).

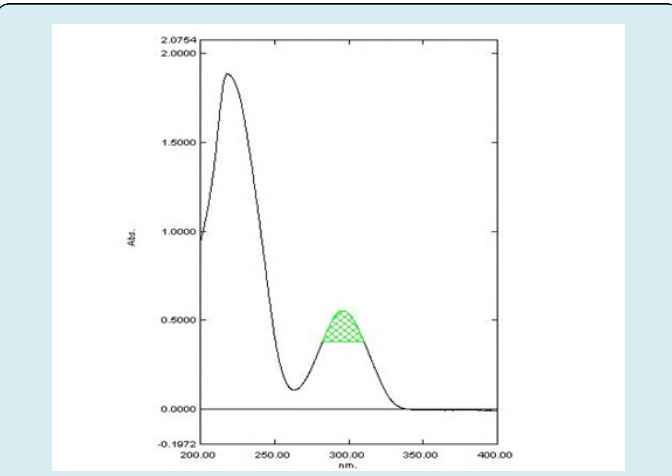

Figure 2: AUC Zero Order Derivative Spectrum of Flecainide Acetate in Water.

Method B: Area Under Curve First Order UV Spectrophotometric Method: The zero order spectrums were derivatized into first order spectrum and the AUC was recorded between 280.00-310.20nm as shown in Figure 3.

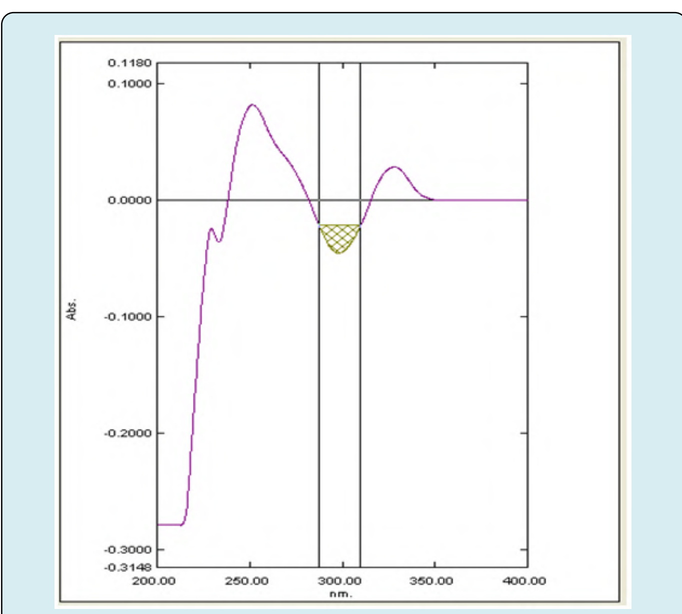

Figure 3: AUC First Order Derivative Spectrum of Flecainide Acetate in Water.

Method C: RP-HPLC Method: In Method C RP-HPLC method in which separation was achieved by gradient elution using a C_{18} Qualisil BDS (250mm×4.5mm×5µm) column, a mobile phase consisting of water: acetonitrile (60:40 v/v) with mobile phase pH adjusted with orthophosphoric acid (pH 3.0), a flow rate of 1.0ml/min and UV detection at 296nm. The linearity was obtained in the conc. range of 10-50µg/ml. The retention time of Flecainide acetate was 9.3min (Figure 4).

Validation of Proposed Methods A, B and C

The proposed UV and HPLC methods A, B and C were validated across various parameters like linearity, accuracy, precision, ruggedness, sensitivity, repeatability, bulk and pharmaceutical formulation assay according to ICH guidelines [11].

Linearity

The concentration range 20-120µg/ml for method A and method B, while for method C the linearity concentration range 10-50µg/ml.

Accuracy

To the pre-analyzed sample solutions, a known amount of stock standard solution was added at different levels, i.e. 80%, 100%, and 120%. The solutions were re-analyzed by the proposed methods.

Precision

The precision of the methods was studied as intra-day and inter-day variations. In Method A and B precision was determined by analyzing the 40, 60, and 80µg/ml of FA solutions as intra-day and inter-day variations. While in method C precision was determined by analyzing 20, 30, and 40µg/ml of FA solutions as intra-day and inter-day variations.

Ruggedness

The ruggedness of the proposed methods was determined for 60µg/ml concentrations of drug in Method A and B and 30µg/ml in Method C by analysis of aliquots from a homogenous slot by two analysts using the same operational and environmental conditions.

Sensitivity

The sensitivity of measurements of FA by the use of the proposed methods was estimated in terms of the limit of quantification (LOQ) and the limit of detection (LOD). The LOQ and LOD were calculated using equation $LOD=3.3\times N/B$ and $LOQ=10\times N/B$, where 'N' is the standard deviation of the AUC of the drugs (n=3), taken as a measure of noise, and 'B' is the slope of the corresponding calibration curve.

Repeatability

Repeatability was determined by analyzing 60µg/ml concentration of FA solution for six times for methods A and B and 30µg/ml for method C.

Determination of Flecainide Acetate in bulk

A quantity of powder equivalent to 60µg/ml was transferred into a 100ml volumetric flask containing 30 ml of water, sonicated for 15min, the volume was adjusted to the mark using the same solvent and filtered through Whatman filter paper no. 41. An appropriate volume 6 ml was transferred into a 10ml volumetric flask and volume was adjusted to the mark to obtain the desired concentration of 10µg/ml. The AUC was recorded at selected wavelengths for Method A while in Method B, AUC of the first-order derivative spectrum were recorded in between selected wavelength ranges and for method C concentration of 30µg/ml was injected in system and the concentration of the drug was determined from the respective linear regression equations.

Application of Proposed Method for Pharmaceutical Tablet Formulation

The pharmaceutical tablet formulation, Flecarite (Torrent) 20 tablets were accurately weighed, average weight determined and ground into fine powdered. A quantity of powder equivalent to 60µg/ml was transferred into a 100ml volumetric flask containing 30ml of water, sonicated for 15min, volume was adjusted to the mark using the same solvent and filtered through Whatman filter paper no. 41. An appropriate volume 6ml was transferred into a 10ml volumetric flask and the volume were adjusted to the mark to obtain the desired concentration of 10µg/ml. The AUC was recorded at selected wavelengths for method A while in method B, AUC of the first-order derivative spectrum was recorded in between selected wavelength ranges and 30µg/ml injected in HPLC system (Method C).The concentration of the drug was determined from the respective linear regression equations.

Results and Discussion

The proposed methods (A, B and C) was validated across the various parameters like linearity, accuracy, precision, ruggedness, sensitivity, repeatability, bulk and pharmaceutical formulation assay as per ICH guidelines.

Linearity

The linear regression data for the calibration curves showed a good linear relationship over the concentration range 20-120µg/ml for Method A and Method B. The linear regression equation was found to be y= 0.0463x–0.0403 and y = 0.0373x+0.1652 for AUC zero order and AUC first order respectively while a good correlation coefficient (r^2=0.9995 and r^2=0.9993) for both the methods A and B (Figures 5a & 5b) and for method C the linearity concentration range 10-50µg/ml and the linear regression equation was found to be y= 327.29x+5649.7 with r^2=0.9992 (Figure 6).

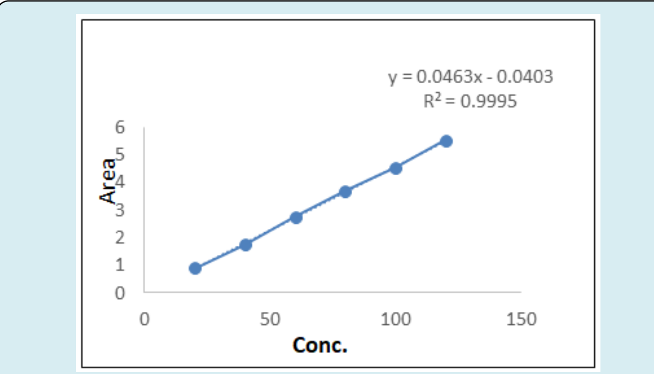

Figure 5a: Linearity Curve of Flecainide Acetate by AUC Zero Order Derivatives.

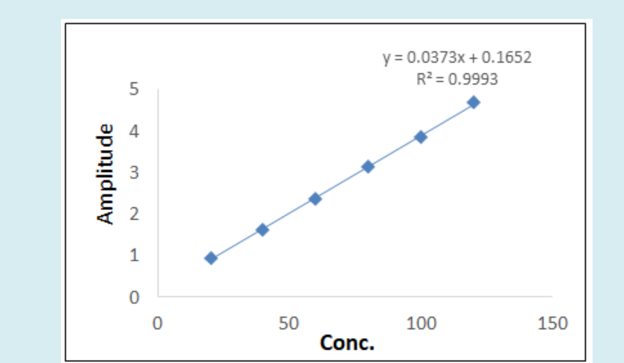

Figure 5b: Linearity Curve of Flecainide Acetate by AUC First Order Derivatives.

Precision

The precision of the developed method was expressed in terms of % relative standard deviation (% RSD). These results show reproducibility of the assay. The % RSD values found to be less than 2 indicate that the methods were precise for the determination of drugs in formulation. The results are expressed in Table 3.

Methods	Conc. (µg/ml)	Intra-day precision		Inter-day precision

Table 7: Analysis of Flecainide Acetate in Tablet Formulation.

Sensitivity

The LOD and LOQ for selected drug were found to be 0.20 and 0.61µg, respectively, for method A, and 0.32 and 0.97µg, respectively for method B while it is found to be 0.03 and 0.12 for method C. The results are expressed in Table 8.

Methods	Linear Regression Equation	LOD (µg/ml)	LOQ (µg/ml)
A	$y = 0.0463x - 0.0403$ ($r^2 = 0.9995$)	0.2	0.61
B	$y = 0.0373x + 0.1652$ ($r^2 = 0.9993$)	0.32	0.97
C	$y = 327.29x + 5649.7$ ($r^2 = 0.9992$)	0.03	0.12

Table 8: Sensitivity Studies of Flecainide Acetate.

Conclusion

The spectrophotometric and chromatographic methods are developed and validated successfully for estimation of Flecainide acetate. The determination of drug candidate was done by taking bulk as well as in pharmaceutical tablet formulation. The results of the analysis of pharmaceutical formulation by the proposed methods are reproducible and reliable. This indicates that there is no interference of excipients. All these developed spectrophotometric and chromatographic methods are found to be simple, accurate, precise, and economical when validated as per ICH guidelines. Thus the proposed method can be used for routine analysis of Flecainide acetate.

Acknowledgments

The authors are thankful to Life Sciences Pvt. Ltd, Mumbai, (India) for providing Flecainide acetate as a gift sample.

Abstract

Pectin is a naturally occurring biopolymer. It has been used successfully for many years in the food and beverage industry as a thickening agent, a gelling agent and a colloidal stabilizer. In this review, study of the role of pectin polysaccharides, including its various pharmacological activity, such as its immuno-regulatory, anti-inflammatory, hypoglycemic, antibacterial, antioxidant and antitumor activities, have been summarized. The review provides natural sources, chemical structures, biological activities, and practical applications in the food industry as well as pharmacology and different branches of medicine. Pectin has become an essential part of the research and development of natural herbs and health products due to their wide availability.

***Keywords**: - Citrus Pectin, Source, extraction, Biological activity, glycogen regulation.*

INTRODUCTION

French chemist Louis Nicolas Vauquelin in 1790 in tamarind fruit, discovered pectin in citrus fruits (Vauquelin, 1790). Henri Braconnot introduced the term "pectin" because of the gelling properties of these substances (Braconnot, 1825). Pectin is usually obtained from the residues of plant material after extracting the juice (apple or citrus peel) or sugar (sugar beet). This review will first describe the source and production, chemical structure and general properties of pectin. Pectin is the methylated ester of polygalacturonic acid, contains 1, 4-linked α-D-galacturonic acid residues.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

STRUCTURE OF PECTIN

Pectin is a polysaccharide with a core consisting of α-1,4-linked D-galacturonic acid and α-1, 2-L-rhamnose, large number of neutral sugars, including arabinose, galactose, and lesser amounts of other sugars. The structural classification of pectin includes: homogalacturonan (HG), rhamnogalacturonan I (RG-I), and substituted galacturonans such as rhamnogalacturonan II (RG-II) (Figure 1). It composed of as many as 17 different monosaccharides and more than 20 different linkages. (Minzanova, Salima T et al. 2018)

GENERAL PROPERTIES OF PECTIN

Pectins are soluble in warm water. Monovalent cation salts of pectinic and pectic acids are usually soluble in water; di- and trivalent cations salts are weakly soluble or insoluble. Dry powdered pectin, when added to water, has a tendency to hydrate very rapidly, forming clumps.

Most important use of pectin is based on its ability to form gels. HM-pectin forms gels with sugar and acid. HM-pectin, unlike LM-pectin, does not contain sufficient acid groups to gel or precipitate with calcium ions, although other ions such as aluminium or copper cause precipitation under certain conditions. (Rolin C 1993), (Hercules Incorporated 1999). (Raj et al. 2012)

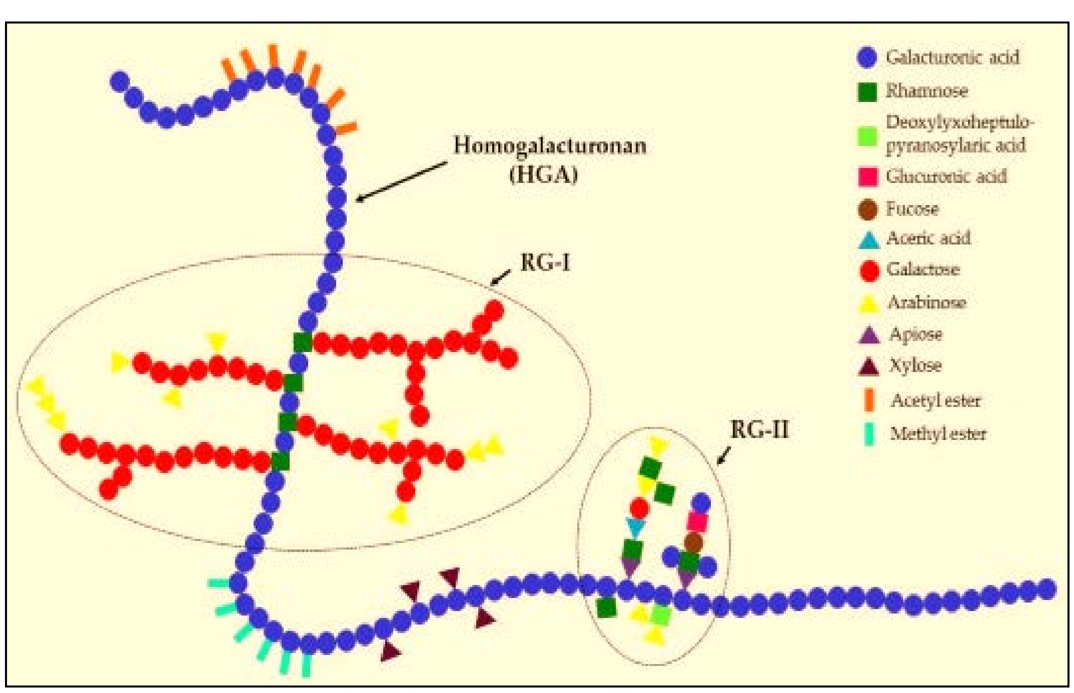

***Fig.1**. A scheme of primary structure of pectin*

METHODSOF PECTIN PREPRATION

Sample Preparation

The samples (Cola milleni, Irvingia gabonensis and Theobroma cacao) peel and husk were sun dried for one week and making powder using blender. The powdered samples were sieved with a fine mesh of size 14mm. The sieved samples were kept in an air tight container prior to extraction process.

Extraction of Pectin (Oloye, 2013)

Extraction of pectin from the samples was performed under acid condition. The dried powder pectin was extracted by mixing with acidified distilled water inside a water bath at different temperatures ranges from 50 - 100°C and different time from 30 – 150 mins. After contact time reflux, the samples were filtered through cheesecloth and cooled; it was then centrifuged for 20 mins at 3,500 rpm. Ethanol 96% was added to the supernatant and allowed to stand for one hour for pectin precipitation. The precipitated pectin was separated by filtration, washed thrice its volumes with absolute ethanol and washed twice with water to remove impurity. The extracts were separately dried in an oven at 50°C and the pectin yield was determined. The dried pectin samples were stored in aluminium foils at 4°C until used.

Chemical Constituents: The neutral sugars that essentially form the side chains on the pectin molecules are namely: galactose, arabinose, xylose, and fructose. They also contain Saponin, Tannin, Alkaloid, Flavonoid, Steroid, Terpenoid, Glycoside and Phenol. (Oloye, 2013)

ROLE OF CITRUS PECTIN IN BIOLOGICAL ACTIVITY

Immunomodulatory Activity:

Immunomodulators are natural or synthetic substances that have a regulating effect on the immune system. Plant-derived polysaccharides, including pectin can directly activate the immune function of macrophages, promote the production of cytokines, and therefore regulate the immune system on multiple levels. The immunomodulatory activities of the oligomer fractions are still observed in the studies. Enzymatic digestion of pectin, which also show the value of the back bone of pectin.

The carbohydrate chain of pectin determines immunosuppressive activity. It was found that pectin containing more than 80% of galacturonic acid residues suppress the activity of macrophages and inhibit the delayed-type hypersensitivity reaction. In addition, the branched region of the pectin macromolecule mediates the stimulation of phagocytosis and increased production of antibodies. (Popov & Ovodov, 2013)

Anti-inflammatory Effect:

Inflammation has been considered as a main risk factor for different progressive illnesses in human beings, such as neurological disorders, cancer, metabolic diseases, and cardiovascular disease, and a primary strategy to prevent these diseases is to target the reduction of chronic inflammation. (Leivas C.L et al., 2016)The intake of dietary fibers such as plant cell wall polysaccharides enhances the efficiency of treatment of inflammatory processes. Much attention has been focused in recent years on pectin.

Popov et al. has studied the anti-inflammatory activity of citrus pectin in vivo after oral administration in mice. (Popov S.V et al., 2013)Three models of inflammation were used: cytokine production by blood leukocytes in response to lipopolysaccharide, acetic acid-induced colitis, and endotoxin shock.

The results of the study demonstrate that low methyl-esterified citrus pectin inhibits local and systemic inflammation, while

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

pectin with a higher degree of esterification can inhibit intestinal inflammation.

Antioxidant Activity:

Oxidation is vital to plenty of organisms that can generate energy to supply biological processes. In normal circumstances, free radicals govern cell growth, and suppress viruses and bacteria. Nevertheless, in large quantities and without regulation, the production of free radicals induced by oxygen cause cell damage, which renders the pathological progressions. The oxidative stress is associated with chronic obstructive pulmonary disease, asthma, diabetes, inflammation, cardiovascular diseases, and myocardial infarction. (Wang, J et al., 2016)

Antitumor Activity:

Many in vitro and in vivo studies concerning the antitumor activity of native and modified pectin revealed a decrease of adhesion and cell proliferation, as well as the induction of apoptosis and migration. (Bush, P et al., 2014) Maxwell et al. have assessed pectin from different sources (potato, sugar beet, larch, and citrus) for effects against colon cancer cells. (Maxwell,E.G et al.,2015) Extracts of potato pectin lowered the proliferation of colon cancer cells by the alteration of dose.

Sugar beet pectin extracts presenting various structures of pectin showed high anti-proliferative action against colon cancer cells. (Maxwell, E.G et al., 2016) The alkali treatment of pectin surged the antitumor activity of sugar beet pectin due to an apoptosis promotion. The pectic polysaccharide from apple can induce the death of cancer cells death and suppress the growth of tumors in vivo, as Delphi and Sepehri described. (Delphi, L et al., 2016)

Hypoglycemic / Anti-diabetic Effect:

Research was conducted to study the anti-diabetic effect of citrus pectin in diabetic rats and the potential benefits of citrus pectin to produce anti-diabetic effects in cases of T2DM caused by a low-dose streptozotocin and a fat-laden diet. Many tests have demonstrated that anti-diabetic polysaccharides effectively improve glucose tolerance.

Low-dose citrus pectin (500 mg/kg bw per day), the medium-dose citrus pectin (1000 mg/kg bw per day) and the high-dose

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

citrus pectin (2000 mg/kg bw per day) intragastrically administered.

Citrus pectin reduced fasting blood glucose levels, benefited hyperlipidemia, and refined hepatic glycogen content glucose tolerance in the diabetic rats. Citrus pectin modulated the expression of the basic proteins in the PI3K/Akt signaling pathway, which could have influenced the enhancement of insulin sensitivity in the diabetic rats, possibly by signifying the anti-diabetic effect of citrus pectin. (Liu, Dong, Yang, & Pan, 2016)

Neuroprotective Effect:

We investigated the neuroprotective activities of ginseng pectin (GP) against hydrogen peroxide (H_2O_2)-induced neuronal toxicity in different neuronal cells. GP protects neuronal cells from hydrogen peroxide-induced cell death. GP protects cortical neuron cell neurites from degeneration. GP neuroprotective effect occurs through the activation of ERK/MAPK and Akt survival signaling pathways. Ginsenoside Rb1 has been shown to protect neuronal cells against hydrogen peroxide-induced cell damage possibly by scavenging free radicals, inhibiting the production of nitric oxide, preventing lipid peroxidation and avoiding decrease in SOD activity.

GP showed similar protective effects on neuronal cells against H_2O_2-induced oxidative stress via regulating the pro-survival ERK/MAPK and Akt pathways. Moreover, GP preserved the structural integrity of neurons, suggesting that it may be a new neurotrophin. In conclusion, GP appears to be anti-oxidant without side-effects, which may eventually lead to further development of therapeutics for neurodegenerative diseases. (Fan et al., 2012)

Glycogen regulation

Pectin decreased PKC (protein kinase-c) activity in liver and increased PKC activity in brain. (Kramer HK, 1997) Pectin also enhanced glycogenesis and reduced glycogenolysis. Activation of PKC stimulate the serotonin receptor or transporter in brain. (Vijayalakshmi, 2014).MCP prevents blood-brain barrier disruption possibly by inhibiting galectin-3.

DISCUSSION

Pectin structure provide significant immunomodulatory properties. However, future research studies necessary to verify

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

the immune activity in vivo and determine howthemechanismsofpectinaffectmacrophagesandotherimmunocytesforsafeclinical applications.

Studies of the antimicrobial properties of pectins show a general tendency for the development of nanocomposites and nanoemulsions on their base. Both exhibit noticeable inhibitory effects, mainly against Gram-negative Escherichia coli and Gram-positive Staphylococcus aureus. The analysis of the reviewed studies shows that pectin polysaccharides from various source demonstrate antioxidant activity. It was also shown that pectins of diverse chemical structure (HG, RG-I, RG-II) exhibit antioxidant properties. Hypoglycemic activity of pectins is useful for the development of low-toxicity antidiabeticagents.

Drugs based on dietary and medicinal plants don't cause side effects, which helps pectin promising for further research. Anti-inflammatory properties of pectin is given great attention in the literature, because pectin have a great potential for anti-inflammatory multi-purpose therapy. Another fast-growing field of pectin useful application is anti-cancer therapy, which is due to safety of pectin and its derivatives. However, the lack of research on pectin polysaccharide protection mechanisms and clinical trials has limited the application of pectin in the field of medicine thus far.

CONCLUSION

Recently updated knowledge about Citrus pectinplay beneficial role in various biological activity. Pectin extracted from Citrus fruits, Cola milleni, Irvingia gabonensis and Theobroma cacao. Pectin also enhanced glycogenesis and reduced glycogenolysis .Results of a study of the bioactivity of pectin polysaccharides, including its various pharmacological action, such as its immunoregulatory, anti-inflammatory, hypoglycemic, antibacterial, antioxidant and antitumor activities, Neuroprotective have been summarized.

Abstract

The Oral controlled drug delivery system represent the most popular form of sustain drug delivery system for the obvious advantages of oral route of drug administration. Such systems release the drug with constant or variable release rates. The oral controlled release system show a typical pattern of drug release in which the drug concentration is maintain in the therapeutic windows for prolonged period of time (sustain release), there by insuring sustained therapeutic action. They are used as single dosage form. λMax of losartan potassium was found to be at 205.3 nm. All formulation of Losartan potassium micro beads showed the particle size between 0.61 to 0.77mm. The lowest % entrapment efficiency was obtained in formulation F1 and highest was found to be formulation F3. The result demonstrated that effect on % entrapment efficiency with in decreasing concentration of sodium alginate. The drug releases of F 1, F 2 and F 3 formulations is found to be 50.2% to 98.52%, 49.21% to 98.23% and 43.21% to 98.52% respectively. Among all formulations, F 3 was show maximum drug release i.e. 98.51% after 12 hr. It was observed that extent of drug release is attributed to the increase in amount of sodium alginate. All the formulation of microbeads produced the optimum swelling [...] 156–267. The minimum swelling ratio of formulation F1 and higher swelling ratio of formulation F3 is obser[...] involves preparation and evaluation of sustained release of microbeads of losartan potassium employing sodium alginate as natural polymer. Abstract

The aim of the present work is to establish three simple, economical and rapid methods for the quantification of Flecainide acetate in bulk drug and in tablets formulation. This study is designed to validate and developed spectroscopic and chromatographic methods as per ICH guidelines. In Method A, area under curve (AUC) of zero-order spectrum was recorded between 277.00 and 310.00nm. Linearity was found in the concentration range of 20-120µg/ml. In Method B, zero-order spectra were derivatized into first-order and the AUC was recorded between 280.00 and 310.20 nm. The linearity was found in the conc. range of 20-120µg/ml. In Method C, separation was achieved using RP-HPLC by gradient elution using a C18 Qualisil BDS (250mm×4.5mm×5µm) column, a mobile phase consisting of water: acetonitrile (60:40 v/v) with mobile phase pH adjusted with orthophosphoric acid (pH 3.0), a flow rate of 1.0ml/min and UV detection at 296nm. The linearity was obtained in the concentration range of 10-50µg/ml. The developed methods are validated successfully across various parameters in accordance with ICH guidelines. Thus, the proposed methods can be used for routine analysis of Flecainide acetate as it does not showed any interference of excipients when estimated in pharmaceutical formulations.

Keywords: Flecainide Acetate; Spectrophotometric; Chromatographic; Area Under Curve; Derivative-Spectrophotometry; Validation; ICH Guidelines

Abbreviations: AUC: Area under Curve; FA: Flecainide Acetate; LOQ: Limit of Quantification; LOD: Limit of Detection.

Introduction

Flecainide Acetate (FA) is chemically designated as N-(2-piperidinylmethyl)-2, 5-bis (2, 2, 2–trifluoroethoxy) benzamide acetate having molecular formula: $C_{19}H_{24}F_6N_2O_5$ with molecular weight: 474.4g/mol (Figure 1) [1]. It is a white solid powder with melting point 146-152°C [2]. It is an antiarrhythmic agent (class IC) causing a decreased in intra-cardiac conduction velocity in all parts of the heart [3]. It is used for the treatment of tachyarrhythmia, atrial fibrillation, supraventricular tachycardia and ventricular tachycardia by blocking Na+ current delayed rectifier K+ current [classified as a Na+ channel blocker drug] [4]. Flecainide also has local anesthetic effects. It selectively increases anterograde and retrograde accessory pathway refractoriness. The action of Flecainide in the heart prolongs the PR interval and widens the QRS complex. The effect on the JT interval is insignificant as Flecainide does not lengthen ventricular repolarization [5]. The drug is official in the European [6], British [7] and US pharmacopeias [8]. Several chromatographic methods have been reported in the literature for the determination of FA in its bulk powder, in pharmaceutical formulations or in the presence of its enantiomers, metabolites or other

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR

Satara

antiarrhythmic drugs [4].

Figure 1: Chemical Structure of Flecainide Acetate.

Analysis part is an important for formulation development of any drug molecule. A suitable and validated method should be vacant for the drug delivery system for analysis of bulk drug and formulation [9]. The developed methods were validated for accuracy, precision, ruggedness, and sensitivity. Accordingly, the objective of this study was to develop and validate the simple spectrophotometric method for the estimation of FA in bulk and tablets as per ICH guidelines.

Experimental

Instrumentation

The Shimadzu double beam UV-VIS spectrophotometer with spectra manager software UV Probe 2.21 with 10mm quartz cells was used. The chromatographic separation was achieved by using Agilent system consisting photodiode array detector, C_{18} Qualisil BDS (250mm×4.5mm×5µm) column [10]. All weights were taken on an electronic balance (Model Shimadzu AUX 120).

Chemicals

The gift sample of FA was obtained from Indeus Life Sciences Pvt. Ltd, Mumbai. Analytical grade solvents and reagents were purchased from Merck specialties Pvt. Ltd. Mumbai (India). Double distilled water filtered through the membrane filter was used. Flecarite tablets each containing 100mg of active drug were purchased from the local market.

Preparation of Standard Stock Solution

The standard stock solution was prepared by dissolving 10mg of FA in the 100ml of water, sonicated and to obtain the concentration of 100µg/ml.

Method A: Area under Curve Zero Order UV Spectrophotometric Method: Concentration of 10µg/ml was prepared by diluting 1ml of standard stock solution with 10ml of water. This solution was scanned in the UV-visible range 400-200nm. FA showed the maximum absorbance at 296 nm as shown in and the AUC of the zero order spectrums was recorded between the 277.00-310.00nm (Figure 2).

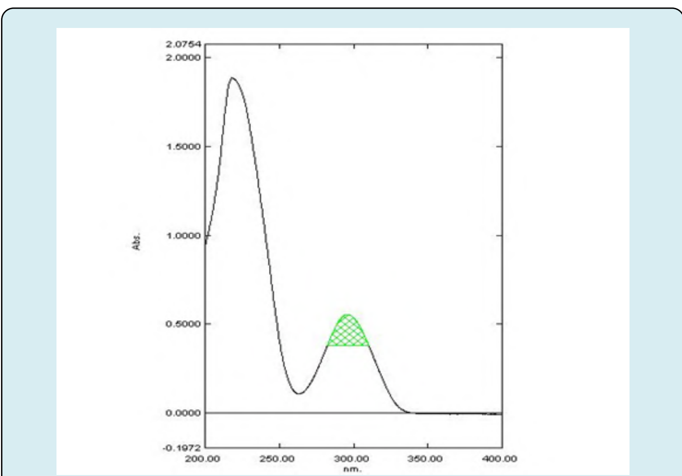

Figure 2: AUC Zero Order Derivative Spectrum of Flecainide Acetate in Water.

Method B: Area Under Curve First Order UV Spectrophotometric Method: The zero order spectrums were derivatized into first order spectrum and the AUC was recorded between 280.00-310.20nm as shown in Figure 3.

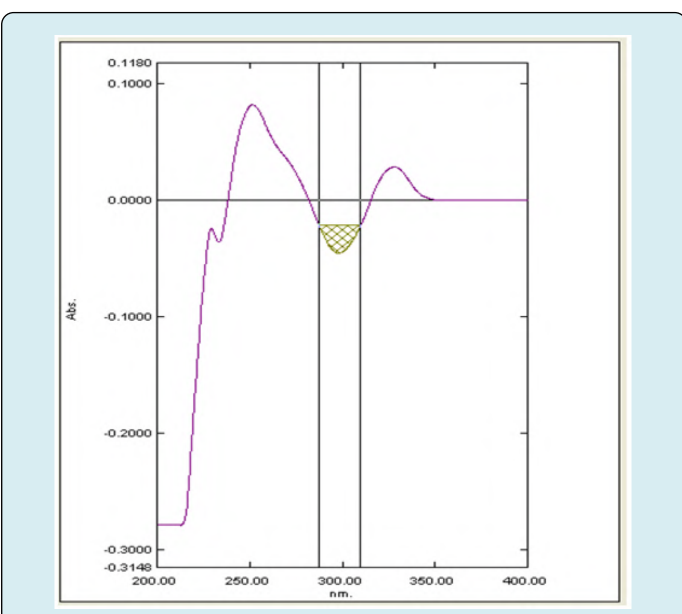

Figure 3: AUC First Order Derivative Spectrum of Flecainide Acetate in Water.

Method C: RP-HPLC Method: In Method C RP-HPLC method in which separation was achieved by gradient elution using a C_{18} Qualisil BDS (250mm×4.5mm×5µm) column, a mobile phase consisting of water: acetonitrile (60:40 v/v) with mobile phase pH adjusted with orthophosphoric acid (pH 3.0), a flow rate of 1.0ml/min and UV detection at 296nm. The linearity was obtained in the conc. range of 10-50µg/ml. The retention time of Flecainide acetate was 9.3min (Figure 4).

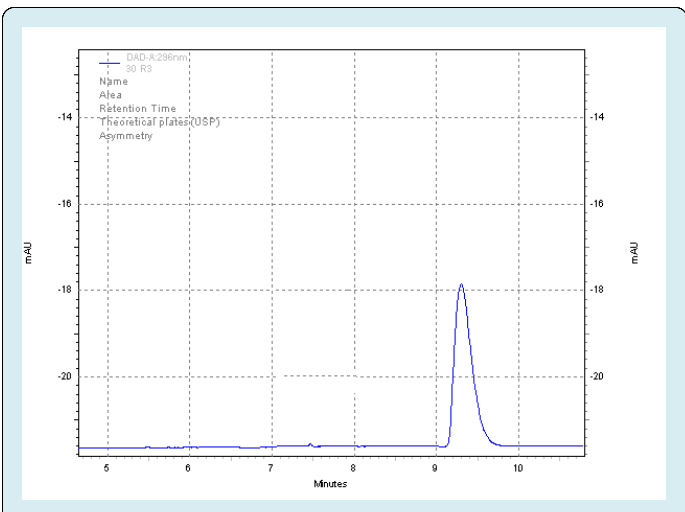

Figure 4: Chromatogram of Flecainide Acetate Showing Retention Time 9.3min.

Validation of Proposed Methods A, B and C

The proposed UV and HPLC methods A, B and C were validated across various parameters like linearity, accuracy, precision, ruggedness, sensitivity, repeatability, bulk and pharmaceutical formulation assay according to ICH guidelines [11].

Linearity

The concentration range 20-120µg/ml for method A and method B, while for method C the linearity concentration range 10-50µg/ml.

Accuracy

To the pre-analyzed sample solutions, a known amount of stock standard solution was added at different levels, i.e. 80%, 100%, and 120%. The solutions were re-analyzed by the proposed methods.

Precision

The precision of the methods was studied as intra-day and inter-day variations. In Method A and B precision was determined by analyzing the 40, 60, and 80µg/ml of FA solutions as intra-day and inter-day variations. While in method C precision was determined by analyzing 20, 30, and 40µg/ml of FA solutions as intra-day and inter-day variations.

Ruggedness

The ruggedness of the proposed methods was determined for 60µg/ml concentrations of drug in Method A and B and 30µg/ml in Method C by analysis of aliquots from a homogenous slot by two analysts using the same operational and environmental conditions.

Sensitivity

The sensitivity of measurements of FA by the use of the proposed methods was estimated in terms of the limit of quantification (LOQ) and the limit of detection (LOD). The LOQ and LOD were calculated using equation LOD=3.3×N/B and LOQ=10×N/B, where 'N' is the standard deviation of the AUC of the drugs (n=3), taken as a measure of noise, and 'B' is the slope of the corresponding calibration curve.

Repeatability

Repeatability was determined by analyzing 60µg/ml concentration of FA solution for six times for methods A and B and 30µg/ml for method C.

Determination of Flecainide Acetate in bulk

A quantity of powder equivalent to 60µg/ml was transferred into a 100ml volumetric flask containing 30 ml of water, sonicated for 15min, the volume was adjusted to the mark using the same solvent and filtered through Whatman filter paper no. 41. An appropriate volume 6 ml was transferred into a 10ml volumetric flask and volume was adjusted to the mark to obtain the desired concentration of 10µg/ml. The AUC was recorded at selected wavelengths for Method A while in Method B, AUC of the first-order derivative spectrum were recorded in between selected wavelength ranges and for method C concentration of 30µg/ml was injected in system and the concentration of the drug was determined from the respective linear regression equations.

Application of Proposed Method for Pharmaceutical Tablet Formulation

The pharmaceutical tablet formulation, Flecarite (Torrent) 20 tablets were accurately weighed, average weight determined and ground into fine powdered. A quantity of powder equivalent to 60µg/ml was transferred into a 100ml volumetric flask containing 30ml of water, sonicated for 15min, volume was adjusted to the mark using the same solvent and filtered through Whatman filter paper no. 41. An appropriate volume 6ml was transferred into a 10ml volumetric flask and the volume were adjusted to the mark to obtain the desired concentration of 10µg/ml. The AUC was recorded at selected wavelengths for method A while in method B, AUC of the first-order derivative spectrum was recorded in between selected wavelength ranges and 30µg/ml injected in HPLC system (Method C).The concentration of the drug was determined from the respective linear regression equations.

Results and Discussion

The proposed methods (A, B and C) was validated across the various parameters like linearity, accuracy, precision, ruggedness, sensitivity, repeatability, bulk and pharmaceutical formulation assay as per ICH guidelines.

Linearity

The linear regression data for the calibration curves showed a good linear relationship over the concentration range 20-120μg/ml for Method A and Method B. The linear regression equation was found to be y= 0.0463x–0.0403 and y = 0.0373x+0.1652 for AUC zero order and AUC first order respectively while a good correlation coefficient (r^2=0.9995 and r^2=0.9993) for both the methods A and B (Figures 5a & 5b) and for method C the linearity concentration range 10-50μg/ml and the linear regression equation was found to be y= 327.29x+5649.7 with r^2=0.9992 (Figure 6).

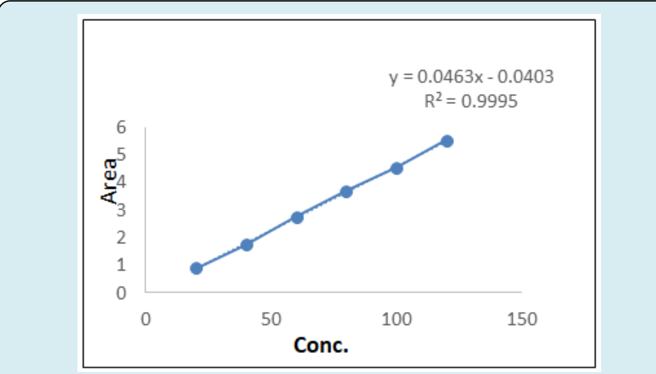

Figure 5a: Linearity Curve of Flecainide Acetate by AUC Zero Order Derivatives.

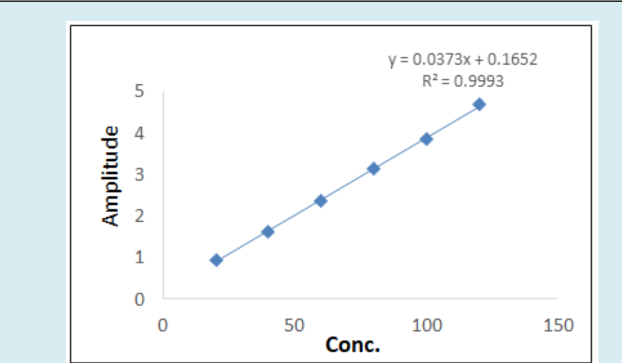

Figure 5b: Linearity Curve of Flecainide Acetate by AUC First Order Derivatives.

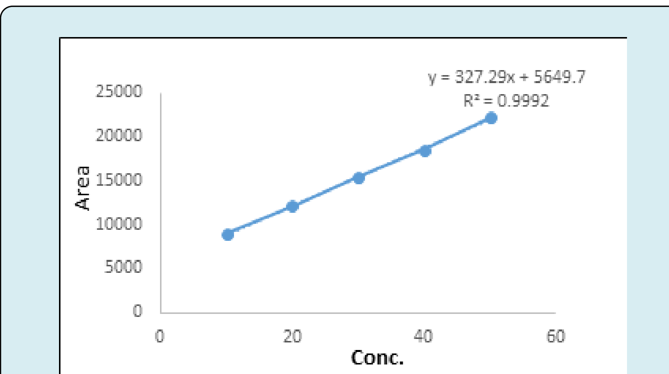

Figure 6: Linearity Curve of Flecainide Acetate by RP-HPLC.

The results of linearity are expressed in Table 1.

Method A		Method B		Method C

120	5.5188	120	4.6912		

Table 1: Linearity Studies of Flecainide Acetate.

Accuracy

The solutions were reanalyzed by proposed method. The mean % recovery was found to be in the range of 98.45 to 99.99% for all three methods with % RSD less than 2 indicate that the methods were precise. The results are expressed in Table 2.

Precision

The precision of the developed method was expressed in terms of % relative standard deviation (% RSD). These results show reproducibility of the assay. The % RSD values found to be less than 2 indicate that the methods were precise for the determination of drugs in formulation. The results are expressed in Table 3.

Methods	Conc. (µg/ml)	Intra-day precision		Inter-day precision	
		% Amount found*± SD	% RSD	% Amount found*± SD	% RSD
A	40	98.35± 0.65	0.66	98.48± 0.47	0.48
	60	99.36± 0.76	0.77	99.31± 0.72	0.73
	80	99.12± 0.13	0.13	99.05± 0.11	0.11
B	40	98.25± 0.55	0.56	98.31± 0.50	0.51
	60	98.44± 0.59	0.6	98.56± 0.61	0.62
	80	99.40± 0.62	0.62	99.50± 0.67	0.68

Ruggedness

Ruggedness of the proposed methods was determined for selected concentrations. The results were in the acceptable range for all the three methods and % RSD was found to be less than 2, indicating that the method is rugged. The detail results are tabulated as in Table 4.

Methods	Conc. (µg/ml)	Analyst I		Analyst II	
		% Amount found*± SD	% RSD	% Amount found*± SD	% RSD
A	60	99.07± 1.04	1.05	98.56± 0.84	0.85
B	60	98.54± 0.70	0.71	99.04± 1.05	1.06
C	30	98.86± 0.81	0.82	98.47± 0.83	0.84

*(n=6)

Table 4: Ruggedness Studies of Flecainide Acetate.

Repeatability

Repeatability was determined for selected concentrations of FA solution for six times and the % amount determined with % RSD less than 2 for all the three methods. The results are expressed in Table 5.

Methods	Amount taken (µg/ml)	Amount found*	% Amount found*± SD	% RSD
A	60	59.07	98.45± 0.87	0.88
B	60	59.14	98.56± 0.66	0.67
C	30	29.63	98.77± 0.84	0.85

Analysis of Flecainide Acetate in Bulk

The concentrations of the drug were calculated from linear regression equations. The % amount found was within 98.66% to 99.15% with % RSD less than 2 for all the three methods. The results are expressed in Table 6.

Methods	Amount taken (µg/ml)	Amount found*	% Amount found*± SD	% RSD
A	60	59.42	99.03± 1.03	1.04
B	60	59.49	99.15± 0.90	0.91
C	30	29.59	98.66± 0.99	1

*(n=6)

Table 6: Analysis of Flecainide Acetate in Bulk.

Analysis of Flecainide Acetate in Tablet Formulation

The spectrum was recorded at 296nm. The concentrations of the drug were calculated from linear regression equation. The % amount was found around 98% with % RSD less than 2 for all the three methods. The results are expressed in Table 7.

Methods	Amount taken (µg/ml)	Amount found*	% Amount found*± SD	% RSD
A	60	59.11	98.52± 0.80	0.81
B	60	59.2	98.67± 0.79	0.8
C	30	29.59	98.64± 0.68	0.69

*(n=6)

Table 7: Analysis of Flecainide Acetate in Tablet Formulation.

Sensitivity

The LOD and LOQ for selected drug were found to be 0.20 and 0.61µg, respectively, for method A, and 0.32 and 0.97µg, respectively for method B while it is found to be 0.03 and 0.12 for method C. The results are expressed in Table 8.

Methods	Linear Regression Equation	LOD (µg/ml)	LOQ (µg/ml)
A	$y = 0.0463x - 0.0403$ ($r^2 = 0.9995$)	0.2	0.61
B	$y = 0.0373x + 0.1652$ ($r^2 = 0.9993$)	0.32	0.97
C	$y = 327.29x + 5649.7$ ($r^2 = 0.9992$)	0.03	0.12

Table 8: Sensitivity Studies of Flecainide Acetate.

Conclusion

The spectrophotometric and chromatographic methods are developed and validated successfully for estimation of Flecainide acetate. The determination of drug candidate was done by taking bulk as well as in pharmaceutical tablet formulation. The results of the analysis of pharmaceutical formulation by the proposed methods are reproducible and reliable. This indicates that there is no interference of excipients. All these developed spectrophotometric and chromatographic methods are found to be simple, accurate, precise, and economical when validated as per ICH guidelines. Thus the proposed method can be used for routine analysis of Flecainide acetate.

ABSTRACT: The oral route is the most favored technique for administering the drug orally in the body. As a result of certain limitations such as drug absorption, poor bioavailability, first-pass hepatic metabolism and drug targeting to particular organs, may cause problems for administration via oral route. Therefore parenteral route, transmucosal route and transdermal route are preferred over oral route. Intranasal route is deemed to be a desirable route because of the time profile of concentration a drug is close to that of the intravenous route. To increase patient safety and efficacy a new approach for drug delivery i.e. *in situ* nasal drug delivery system has been designed. In *in situ* nasal gels drug is administered as a low viscous solution. When in contact with nasal mucosa, the conformation of the polymer changes to gel form. The gel formulation via nasal route is appropriate for those drugs whose oral administration is problematic due to gastric discomfort, drug absorption, poor bioavailability of drug and first-pass hepatic metabolism. For the gel formulation various triggered polymers are used. The present review focused on therapeutic considerations, anatomy and physiology of nasal cavity, challenges and opportunities in nasal drug delivery, marketed products of *in situ* nasal gels and various evaluation parameters considered during preparation of in situ gel.

INTRODUCTION:

Oral drug delivery is a most desirable route for drug administration. Whenever systemic effects are planned out, oral bioavailability of some compounds has promoted the search of more effective route for the systemic delivery [1].To attain faster and higher level of drug absorption nasal mucosa is the major route of administration in Transmucosal route of drug delivery [1]. Transmucosal nasal delivery has been a very promising route of delivery. Many drugs have been shown to achieve better systemic bioavailability through nasal route when compared with the oral route [2]. In the

6757 YASHODA TECHNICAL CAMPUS SATARA

Ayurvedic systems of Indian medicines, nasal route there is a well-recognized form of treatment; it is known as NASYA KARMA. It is a convenient route for delivery of drugs, which are active in small doses and show minimal oral bioavailability. It is the most suitable dosage form for self-medication [2].

Intranasal administration represents a feasible choice for local and systemic delivery of various therapeutic compounds. The nasal mucosa has a large surface area that affords a quick onset of effects, potential for direct delivery to the central nervous system, it avoids first pass metabolism and shows non-invasiveness; all of this may maximize patient convenience, comfort and compliance [3]. The nasal mucosa acts as a permeation barrier to high molecular weight therapeutic compounds such as proteins and peptides. The tight junctions forming this barrier to paracellular drug delivery can be reversibly and safely opened. Intranasal treatment does not require sterile preparations, it is non-invasive, painless and can also be simply and readily administered by the patient, e.g. in an emergency [4-6].

Intranasal microemulsions, gels and microspheres have increased interest in current years to deliver protein and peptide through nasal route [2]. Recently, *in situ* gel has been introduced as a new dosage form in nasal drug delivery. Liquid nasal formulation compared with *in situ* gels is instilled as low viscosity solutions into the nasal cavity. On interaction with nasal mucosa, the polymer changes its conformation to a gel. So that it not only increases the contact time between drug and absorption site but also slowly releases drugs in the nasal cavity [7].

Therapeutic considerations:

Nose is an integral part of the body for inhalation purposes but when the nose is used as a drug delivery path the effective dose for different drugs has been achieved since the nose provides faster and higher levels of drug absorption and also self-administration possibilities. It is effective in delivery of local, systematic and central nervous system sites [8]. Therapeutic considerations are paramount when selecting the dosing route. These considerations include the pharmaceutical target like local versus systemic, the dosing frequency and the patient population. In approximately cases, intranasal delivery mostly preferred mode of administration [9].

Local delivery:

For the prevention of typical nasal disorder intranasal administration of medications is the natural choice. Common cases are corticoids and antihistamines for cold symptoms. In such a situation, the intranasal route is the principal choice for drug delivery since it shows a rapid sign of relief and shows lesser side effects [8].

Vaccine delivery:

The nasal mucosa was given some antigen through as a route of vaccination. Appropriate antigen with a good adjuvant to the nasal-associated with lymphoid tissue has the ability to encourage humoral and cellular immune responses [10]. This approach may be particularly effective for achieving rapid mass immunization, for instance in children and/or in developing countries and disaster areas [11]. The intranasal immunization can lead to the development of both local and systemic immunity.

Systemic delivery:

The intranasal administration is an effective way of delivering drugs systematically compared to oral and intravascular routes. Thus, the number of drugs administered as nasal formulations intended to attain systemic effects has widely improved [8].

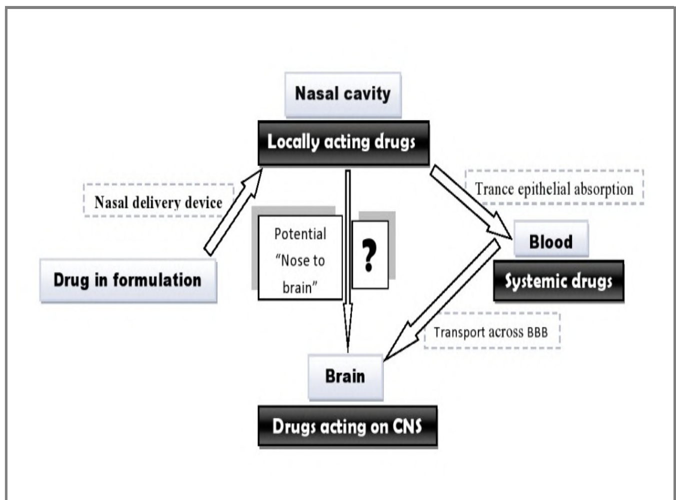

Fig 1. Nose to systemic circulation to brain pathway.

CNS delivery through nasal route:

The tight junctions of Blood Brain Barrier (BBB) surrounding the brain result in a greater trans-endothelial electric resistance (1500 to 2000 Ωcm^2) compared to that other tissues like skin, bladder, colon, lungs (3 to 33 Ωcm^2). The difficulty forced by those brain protective mechanisms has increased the interesting developing strategies to overcome them when brain drug exposure is required. The interpellation imposed by the interesting strategies to overcome them when brain drug exposure is needed for the mechanisms of brain defense has increased. In recent years, intranasal path has occurred

TECHNICAL 6757 YASHODA CAMPUS SATARA
DIRECTOR
Yashoda Technical Campus
Satara

as a positive approach for the delivery of drugs in the brain. The benefits of this drug delivery are the lack of gastrointestinal and hepatic pre-systemic removal [8].

Anatomy and physiology of nasal cavity:

The nasal cavity is divided into two hales by the nasal septum and extends back to the nasopharynx, while the nasal vestibule is the most anterior portion of the nasal cavity, opens up through the nostril to the nose (Fig 2). There are three main regions in the nasal cavity which are the nasal vestibule, the olfactory region and the respiratory region. The surface area in the nose can be increased by the lateral walls of the nasal cavity around 150 cm which contains a folded structure [12]. When compared with its minor volume, its surface area is very high. This folded structure involves three turbinates: the superior, median and the inferior. The nasal airway has narrow passages which is about 1 to 3 mm wide and which helps to perform its principal functions. The nasal cavity is covered by a mucous membrane that splits into two areas; non-olfactory and olfactory epithelium. In the non-olfactory region, the nasal vestibule is lined with skin like stratified squamous epithelial cells, whereas the respiratory field, having a standard airway epithelium filled with multiple microvilli, provides a large area accessible for drug absorption and transportation [13]. In this way, the position of the mucus layer from the anterior to the rare part of the nasal cavity is thus shifted. The mucous membrane protects the nasal turbinate and the atrium. The goblet cells secrete the mucus as mucus granules that swell in the nasal fluid to contribute to the mucus layer. The mucus secretion is composed of approximately 95 % water, 2 % mucin, 1 % salts, 1 % of other proteins such as albumin, immunoglobulin, lysozyme and lactoferrin and 1% lipids. The mucous secretion allows immune response suppression of inhaled bacteria and viruses [13].

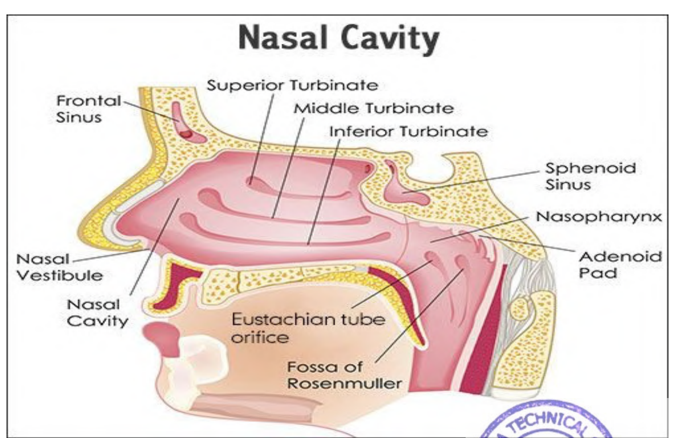

Fig 2. Anatomy of Nasal cavity.

It also performs a number of physiological functions as mentioned below.

- This forms the mucosa, and preserves this physically and enzymatically.
- The mucus has capacity to hold water.
- This exhibits electric behavior on the surface.
- It allows efficient heat transfer.
- It functions as glue and brings particulate matter to the nasopharynx.

Mechanism of drug absorption:

In the first step of absorption, the absorbed drug has to move from the nasal cavity to the mucus layer. Small uncharged drugs can pass through the mucus layer but greater and charged drugs find it very difficult to pass/cross it. Mucin is the main protein of mucus which has a tendency to bind to the solutes and hinders diffusion. The additional structural changes in the mucus layer occur as result of environmental (Temperature and pH) changes.

In this process mainly two mechanisms have been predominantly observed, they are,

➢ Paracellular transport - It produces aqueous, but sluggish and passive transport route. This route is not appropriate for those drugs that have molecular weight larger than 1000 Dalton due to its poor bioavailability [14].

➢ Transcellular transport - This develops the lipoidal pathfor lipophilic drug transport [14].

Transport of the drug through the cell membrane can also be brought about by an active transport path. For example, chitosan, a natural biopolymer from shell fish opens tight junctions between epithelial cells to facilitate drug transport [14].

CHALLENGES AND OPPORTUNITIES FOR NASAL DELIVERY SYSTEMS:

The nasal delivery incentives cannot take full advantage of current nasal delivery systems, such as spray, pumps and pipettes. On the frontal section linked by skin a large portion of the dose is deposited and the deposited drug is not targeted for either topical site or systemic circulation. The patient acceptance is decreased because of the bad taste and discomfort to patients caused by drugs brought along the nose floor. Finally, a real task of prolonging nasal administration of drugs and vaccines is inadequate as a result of complex deposition in the remote region with sinus and middle ear openings and in the olfactory region. New advanced and costly drugs require reproducible bioavailability and demanding combination of dependable dosing and high patient compliance to confirm their efficacy and safety. Mostly liquid nasal products are delivered by metered spray pumps [15].

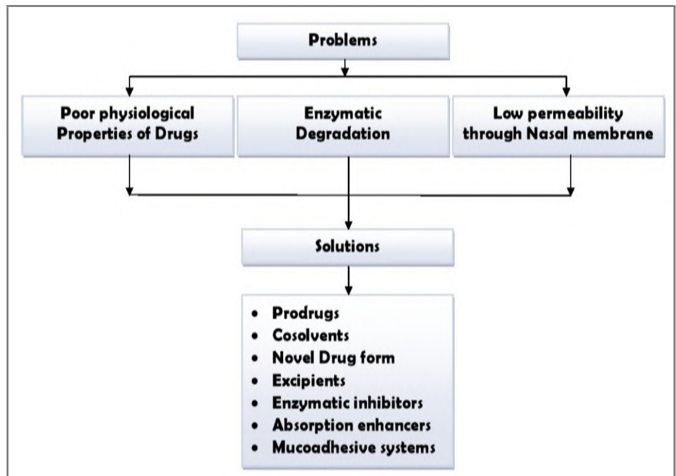

Fig 4. Problems and solutions for *in situ* nasal drug delivery system.

Problems and solutions for in- situ nasal drug delivery system:

The challenges in nasal drug delivery are improved physicochemical properties of drug and formulation, greater permeability and degradation of substances, modify nasal membrane, enhance drug residence time, decrease drug affinity to nasal enzymes, inhibit nasal enzymes, protect nasal enzymes against drug and reduced rapid mucociliary clearance.

CURRENT APPROACHES FOR NASAL PERMEATION ENHANCEMENT:

Based on low drug solubility, rapid enzymatic degradation in the nasal cavity, weak membrane permeation and rapid mucociliary clearance, the bioavailability of nasally administered drugs is largely limited. Several methods to overcome those limitations have been suggested. These methods are enlisted and described below.

Prodrugs:

Lipophilic drugs are poorly water soluble so they easily pass through biomembranes. To make the development of an aqueous nasal formulation probable with an appropriate concentration they should be administered as prodrugs with higher hydrophilic character [16]. The prodrugs must be converted rapidly to the parent drug when in the bloodstream. For example, in contrast with the parent drug many prodrugs of L-Dopa have higher solubility, hence allowing the progress of adequate nasal formulations [15-17].

Co-solvents:

In order to increase drug solubility the usage of co-solvents is an alternative approach for prodrugs. The co-solvents generally used in intranasal formulations include glycerol, ethanol, propylene glycol, polyethylene glycol, and they may be the most relevant as they are non-toxic, pharmaceutically safe, and non-irritating to nasal mucosa [15].

Enzymatic inhibitors:

Nasal mucosa layer serves as an enzymatic barrier during nasal drug delivery, because they have a wide range of enzymes. The different methods are used including protease and peptidase inhibitors to avoid enzymatic degradation. For example, amino peptidases are used as inhibitors in the degradation of calcitonin bestatine, comostate amylase and leupeptin and aprotinin as tyrosine inhibitors probably involved. Furthermore, to help prevent enzymatic degradation of drugs such as

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

leucine encephalin, bacitracin, amastatin,boroleucin and puromycin has been used [18,19]. Eventually, the enzymatic reduction can also be done by using the absorption enhancers like (bile salts and fluidic acid). Disodium EDTA, an absorption enhancer, has been shown to limit enzymatic degradation of beta-sheet breaker peptide used to treat Alzheimer's disease [20].

Permeation enhancers:

Small and large hydrophilic drugs may exhibit poor permeability across nasal epithelium and may thereby show insufficient bioavailability. The permeation can be improved by administering in combination with absorption enhancers which make reversible changes to the epithelial barrier structure [21]. Permeation enhancers and their mechanism of action with examples are given in Table 1.

METHODS OF FORMULATION OF *IN SITU* NASAL GEL:

Cold method:

In this method of formulation, the product and sample quantity of double distilled water are mixed in a refrigerator and held overnight at 4 ºC. Then the in situ gelling polymer is further added slowly with constant stirring.

In a refrigerator the dispersion is stored till a clear solution is designed and volumes adjusted. When gelling polymers like poloxamer, chitosan or Carbopol are used for formulation then this method is selected. In view of the fact that polymeric dispersion of poloxamer persists as a solution at lower temperatures and is concentrated in gel at higher nasal temperatures because the solubility of poloxamer's propylene oxide chain decreases at high temperatures, resulting in precipitation or salting from polymer.

Likewise, chitosan often requires low temperatures to survive as a solution at room temperature, its hydrophobicity increases with higher temperatures [22].

Hot Method:

This form is preferred if gellan gum or pectin is used as a gelling polymer. Gellan chains dissolve in water at higher temperatures and postulate a random coil conformation with high segmental mobility at high temperatures and proceed as a solution at higher temperatures. In the presence of ions such as K^+ or Ca^{2+} sol-gel transformation occurs when gellan gum solution is cooled. Similarly, pectin also needs a higher temperature for demethoxylation purposes which helps to formulate a solution or dissolve pectin [23].

TRIGGERED *IN SITU* GELLING FORMATION:

Temperature triggered *in situ* gel:

There are some polymers which undergo large and unexpected physical and chemical changes in response to small external changes in their environmental conditions. Such polymers are called Stimuli-responsive polymers. They are also called as stimuli-sensitive, intelligent, smart or environmentally sensitive polymers. These polymers recognize a stimulus as a signal, judge the degree of the signal and then transform their chain conformation in response.

Temperature sensitive polymers are the most extensively studied class of environmentally responsive polymer systems in drug delivery. This is because temperature is relatively easy to control and also easily applicable to both *in vitro* and *in vivo*.

In this system, gelling of solution is triggered by alteration in temperature, thus sustaining the drug release.

These hydrogels exist in liquid form at room temperature (20 to 25°C) and undergo gelation when comes in contact with body fluid (35 to 37°C). The use of biomaterial whose transition from sol-gel is triggered by increase in temperature is an attractive way to approach *in situ* formation. The best critical temperature range for such systems is ambient and physiologic temperature; such that clinical manipulation is facilitated and no external source of heat other than that of the body is required to trigger gelation.

pH triggered *in situ* gel:

Another physiological stimulus that induces formation of *in situ* gel is pH. Polymers included in this class contain an acidic or a basic group that either accept or release protons when they are exposed to different environmental pH. Hence these are called pH sensitive polymers. Most of the pH sensitive polymers containing anionic group are based on PAA (Carbopol®, Carbomer) and its derivatives [7].

Ion- activated *in situ* gel:

In this type of gelation, a polymer that undergoes phase transition in presence of ions. Gellan gum is an anionic polysaccharide that undergoes phase transition in the presence of monovalent and divalent cations like Ca^{2+}, Mg^{2+}, K^+, and Na^+ present in the nasal secretion.

Table 1. Mucosal penetration enhancers and mechanisms of action with examples.

Classification	Examples	Mechanism
Surfactants	Anionic: Sodium lauryl sulphate Cationic: Cetyl pyridinium Chloride. Nonionic: Poloxamer, Span	Intercellular lipid disease, Protein domain integrity, Distorts membrane
Bile salts	Sodium glycodeoxycholate, Sodium glycocholate, Sodium taurodeoxycholate	Mucolytic activity, Open tight junctions, Distorts membrane
Cyclodextrins	α,β,γ - Cyclodextrin, Methylated β - Cyclodextrins	Inclusion of membrane compounds, Open Tight junctions
Fatty acids	Oleic acid, Methyloleate, Lauric acid, Caprylic acid, Phosphotidylcholine.	Phospholipid fluidity improves domain, Distorts membrane.
Cationic compounds	Poly-L-arginine, L-lysine	Ionic interaction on the mucosal surface with negative charge
Chelators	Sodium salicylate, EDTA, Sodium citrate, citric acid	Interfere with CaPolyacrylates
Positive charged polymers	Chitosan, Trimethylchitosan	Ionic interaction with negative chargeon the mucosal surface
Bioadhesive Materials	Carbopol, Chitosan Starch	Opens tight junctions, Reduce nasal clearance

Table 2. Delivery System Based Approaches for Intranasal Drug Delivery.

Formulation	Advantages	Disadvantages
Nasal spray	Nasal sprays may be formulated in the form of solution and suspension Exact dose can be delivered via metered dose pumps and actuators	Less efficient than nasal drops when human serum albumin is stored in the nostrils
Nasal drops	Simple and convenient system	Lack of dose precision
Nasal gels	Due to high viscosity reduction of post nasal drip, reducing the effect of tastes due to reduced swallowing and reduction of anterior formulant leakage	Local side effects
Nasal powders	Absence of preservatives and superior stability.	The appropriateness of powder composition depends on the solubility, particle size, aerodynamic properties and nasal discomfort of active drugs
Liposomes	Active encapsulation of large and small molecules with high hydrophilicity and pKa values	Production cost is high Short half-life
Nanoparticles	Deposits their small size	Only the smallest nanoparticles penetrate to the mucous membrane by paracellular route and in a limited amount

POLYMERS USED FOR THE *IN SITU* GELLING SYSTEM PREPARATION:

Polymer used for pH *In situ* gelling system:

***Carbopol*:**

The water absorption property of Carbopol polymers is very good. Because of the pKa of that polymers is 6.0, they swell in water up to 1000 times its original volume adds 10 times its original diameter to form a gel until exposed to a pH of 4.0 to 6.0. Carbopol polymer has high molecular weight and cross linked polyacrylic acid derivatives and also it has strong mucoadhesive properties. It will reduce polymer concentration and improve concentration and improve gelling property when cellulose addition is done. The mostly used gelling polymers are Carbopol 934 and Carbopol 841 [24].

The Mucoadhesive property is due to electrostatic interaction or hydrophobic interaction, hydrogen bonding. It is an acidic molecule. The carboxylic group within the molecule partially dissociates and forms a spiral when dispersed in water. As it is pH sensitive polymer, a rise in the pH of the solution results in polymer swelling. In two stages the gelling effect is activated, neutralization of result by addition of sodium hydroxide or potassium hydroxide, triethanolamine [24].

Polymer used in temperature sensitive *In situ* gelling system:

***Poloxamer*:**

It is a water soluble tri-block copolymer. It contains two polyethylene oxide and polypropylene oxide in an ABA configuration [25].

It has excellent thermal setting properties and improved drug resistance time and it is also known as Pluronic. It is used as a gelling agent and solubilizing agent. It gives colorless, transparent gel. It is available innumerous molecular weights, having different gelling properties. The gelling property depends upon the ratio and partition of the hydrophobic and hydrophilic chain.

The Poloxamer consists of essential polypropylene oxide enclosed by polyethylene oxide. At room temperature (25 °C), it works as viscous liquid and when temperature increases (37 °C) it transforms to transparent gel. It forms a small micellar subunit in solution at low temperatures and changes in temperature results in increased viscosity resulting in swelling to form a large micellar cross-linking network [26,27].

Polymer used in ion sensitive *In situ* gelling system:

***Sodium alginate*:**

It is extracted from brown algae and it is salt of alginic acid. It is linear block polysaccharides. It consists of two types of monomers β-D-Mannuronic acid and α-L glucuronic acid residues linked by 1,4-glycosidic linkages.It is non-toxic and biodegradable. Due to its carboxylic group it has good mucoadhesive property.

The monomers of alginate β-D-Mannuronic acid and α-L glucuronic acid are arranged as M-M block with altering sequence (M-G) block.G-block polymer interacts with calcium molecules resulting in homogenous gel formation. Mechanical strength and porosity of hydrogel depends on the ratio G: M, type of cross linker used [24].

Synthetic Polymers:

***N-isopropyl acrylamide copolymers*:**

It is a non-biodegradable LCST polymer, which collapses about 32 °C in water and forms cross-linked gels.

***PEG/ PLGA Block copolymers*:**

This is a new concept because they combine thermal gelation, biodegradable, and no toxicity. It was planned for an injectable gel device with greater safety and longer gel length [28].

EVALUATION OF NASAL *IN SITU* GELS [26-32]:

Clarity:

The visual inspection under a black and white backdrop will assess the clarity.

Viscosity:

The viscosity and rheological properties of the polymer formulation can be calculated in solution or gel made from artificial tissue fluid and with various viscometers such as the Brookfield viscometer, cone and plate viscometer.

Texture analysis:

For main indications of the syringe capacity of sol the firmness, uniformity and cohesiveness of formulation may be determined using a texture analyzer so the preparations can easily administer *in-vivo*.

Drug content:

About 1ml of prepared solution is taken in 10ml volumetric flask and made up to 10ml and then diluted with 10ml of distilled water. About 1ml from this solution again diluted up to 10ml with distilled water. Using the UV visible spectroscopy, formulated solutions at specific wavelengths are tested.

Gel strength:

Gel strength can be measured by using a Rheometer. A specific volume of gel is prepared in a beaker. A probe is

DIRECTOR
Yashoda Technical Campus
Satara

pushed through the gel. The changes in the load on the probe can be determined as a function of the depth of immersion of the probe below the gel surface.

Sol-gel transition temperature and gelling time:

The temperature and pH of the sol-gel process should be measured for *in situ* gel forming systems. Gelling time is the time required to detect *in situ* gelling in the first place. The thermosensitive *in situ* gel must be tested for in situ gelling at body temperature.

Drug polymer interaction study and thermal analysis:

By using Fourier Transform Infrared (FTIR) Spectroscopy interaction study may be determined. The technique of employing KBr pellet method the nature of the interacting forces may be measured. The Thermo Gravimetric Analysis (TGA) for *in situ* formation method can be performed to measure the percentage of water in hydro gel. The Differential Scanning Calorimeter (DSC) used to detect some difference in thermo gram compared to the pure active ingredients used for gelation.

Gelling capacity:

Mix *in situ* gel with simulated tear fluid (in the proportion of 25: 7, i.e. application volume 25 µL and volume of tear fluid in eye is 7 µL) to find out the gelling capacity of ophthalmic products. The gelation may be assessed visually by noting the time for and time taken for dissolution of the formed gel.

Sterility testing:

As per the IP 1996 the sterility testing is carried out. In this testing, incubate the formulation in the fluid thioglycollate medium at 30 to 35 ºC for a period of 14 days to find the growth of bacteria and in the soybean casein digest medium at 200 to 25 ºC to find the growth of the fungi in the formulation.

Accelerated stability studies:

In amber colored vials and sealed with aluminum fail the formulation is replaced for the short term. As per ICH state guidelines the accelerated stability done at 40±20 °C and 75±5 % RH.

***In vitro* drug release study:**

In situ preparations to be given by the nasal, ocular, the drug release tests are carried out using the plastic dialysis cell. The cell consists of two half cells containing a donor compartment and a receptor compartment. These are isolated by cellulose membranes. The preparation sol form is put inside the donor container. In an incubator, the assembled cell is then shaken horizontally. The total volume of the receiver solution can be removed at intervals and replaced with the fresh media. This receptor solution is examined using analytical receptor media and placed in a shaker water bath at appropriate temperature and oscillation rate. Samples are routinely removed and examined.

APPLICATION OF *IN SITU* DRUG DELIVERY SYSTEM:

Oral drug delivery system:

The natural polymers including pectin, xyloglucan and gellan gum are used in situ forming oral drug delivery systems. The gelation of pectin usually occurs in the presence of H^+ ions, a source of divalent ions, typically calcium ions are required to produce the gels used as vehicles for drug delivery. The paracetamol was reported as an oral in situ gelling pectin formulation for sustained delivery as possible [33].

Ocular drug delivery system:

The natural polymers such as gellan gum, alginic acid and xyloglucan are mostly used in situ forming oral drug delivery systems. The various compounds such as antimicrobials, anti-inflammatory agents and autonomic drug mostly used to alleviate intraocular stress in glaucoma for this purpose have been used for the local delivery of ophthalmic drugs. Due to the high tear fluids and the complexities, the substances are quickly removed from the eyes. The conventional delivery systems often lead to poor bioavailability and therapeutic reactions. So, bioavailability problems have been identified in ophthalmics in situ gels. Because of the temperature and ionic concentration (Ca^{++}) in the tear fluid, gellan's aqueous solution lowered into the eye undertakes a transition to gel state. In the pharmaceutical application the interest about the gellan gum has focused on its application for ophthalmic drug delivery. The drug release from these in situ gels is delayed due to longer precorneal contact times of the viscous gels compared with conventional eye drops [34].

Nasal drug delivery system

The *in situ* gel device for the nasal delivery of mometasone furoate was developed and tested for its safety and efficacy in the treatment of allergic rhinitis by choosing the nasal route. The polymers such as xanthan gum and gellan gum have been used as *in situ* gel

forming systems. The animal studies were conducted using an allergic rhinitis model and the results of in situ gel on antigen mediated nasal symptoms have been observed in sensitized rats. As compared to marketed nasonex formulation (mometasone furoate suspension 0.05 %) *in situ* gel was found to inhibit the increase in nasal symptoms [35].

Rectal drug delivery system:

It also possesses a potential application for rectal and vaginal drug delivery in situ gels. Miyazaki et al. researched the use of xyloglucan based thermoreversible gels for the rectal drug delivery of indomethacin [19].

Vaginal drug delivery system:

A mucoadhesive, thermosensitive, prolonged release vaginal gel incorporating clotrimazole-β-cyclodextrin complex was prepared for the treatment of vaginitis and gives better therapeutic effectiveness and patient compliance. Pluronic F-127 was used as an *in situ* gel forming polymer with mucoadhesive polymers such as Carbopol 934 and hydroxyl propyl methyl cellulose to ensure long residence time at the application site [36].

Injectable drug delivery system:

For tumor treatment an injectable, novel, thermosensitive *in situ* gelling hydrogel was developed. It consists of a chitosan solution filled with drugs neutralized with β-glycerophosphate [37].

MARKETED IN SITU GEL FORMULATIONS:

The marketed *in situ* gel formulations are enlisted in Table 3, 4 and 5.

CONCLUSION:

Nasal drug delivery is a novel platform and it is a promising alternative to injectable route of administration. There is possibility in the near future that more drugs will come in the market in the

DIRECTOR
Yashoda Technical Campus
Satara

form of nasal formulation intended for systemic treatment.

Development of a drug with a drug delivery system is influenced by several factors. For the treatment of long illnesses such as diabetics, osteoporosis, fertility treatment novel nasal products are also expected to be marketed. Bioavailability of nasal drug products is one of the major challenges in the nasal product development. In contrast, a huge amount of money is investigated by pharmaceutical companies in the development of nasal products, because of growing demand of nasal drug products in global pharmaceutical market. So for the avoidance of side effect and improve effectiveness of nasal products we should pay attention to basic research.

ACKNOWLEDGEMENT:

ABSTRACT

Resources for all stakeholders but can be harmful for consumers. Creating awareness of rational drug use is only possible through continued public education with a broad vision of good health and wellbeing of the society. In developed economies, the four As of marketing has been addressed fairly well but in India, the accessibility and awareness is still on a lower side especially for allopathic OTC drugs. In India, the import, manufacture, distribution and sale of drugs and cosmetics are regulated by the Drugs and Cosmetics Act (DCA) and its subordinate legislation, the Drugs and Cosmetics Rules (DCR).

KEYWORDS: OTCs, distribution of patient, side effect of drug, Direction on package, dose regime, survey and Questionnaire, Satara.

INTRODUCTION

Over-the-counter (OTC) medications drugs available to consumers without a prescription play an increasingly vital role in our healthcare system and are the most prevalent means of treating the majority of common health problems in the United States.[1] There are over 80 therapeutic categories of OTC drugs which can be grouped in 12 broad therapeutic classes.[2] Over-the-counter (OTC) drugs are medicines that may be sold directly to a consumer without a prescription from a healthcare professional, as compared to prescription drugs, which may be sold only to consumers possessing a valid prescription. In many countries, OTC drugs are selected by a regulatory agency to ensure that they are ingredients that are safe and effective when used without a physician's care. OTC drugs are usually regulated by active

6757 YASHODA TECHNICAL CAMPUS SATARA
DIRECTOR
Yashoda Technical Campus
Satara

pharmaceutical ingredients (APIs), not final products. By regulating APIs instead of specific drug formulations, governments allow manufacturers freedom to formulate ingredients, or combinations of ingredients, into proprietary mixtures.[3,4]

OTC Medications

Analgesics and antipyretics :- Paracetamol, Diclofenac
Cold, cough, and allergy products:- Levocetrizine,Cetirizine
Gastrointestinal products:- Omiprazole, Ranitidine
Dermatological products:-Dermi5, Dermiside
antifungals, :- Flucanazole, Itraconazole,
Ophthalmic products:-Ketotifen, Nepafenac
Oral health care products: Mouthwash, ToothPest
Menstrual products:- Mefenamic acid,
Vitamins Product :- Cholecalciserol, Ferrous gluconate

Paracetamol

Paracetamol, also known as acetaminophen or APAP, is a medication used to treat pain and fever. It is typically used for mild to moderate pain relief. Evidence for its use to relieve fever in children is mixed. It is often sold in combination with other ingredients such as in many cold medications. In combination with pain medication, paracetamol is also used for more severe pain such as cancer pain and pain after surgery. It is typically used either by mouth or rectally but is also available intravenously. Effects last between two and four hours.[5]

Paracetamol is generally safe at recommended doses. Serious skin rashes may rarely occur, and too high a dose can result in liver failure. It appears to be safe during pregnancy and when breast feeding. In those with liver disease, it may still be used, but in lower doses. Paracetamol is classified as a mild analgesic. It does not have significant anti-inflammatory activity and how it works is not entirely clear.[6]

Omeprazole

Omeprazole contains a tricoordinatedsulfinylsulfur in a pyramidal structure and therefore can exist as either the (*S*) - or (*R*)-enantiomers. Omeprazole is a race mate, an equal mixture of the two. In the acidic conditions of the canaliculi of parietal cells, both enantiomers are converted to chiral products.[7] (sulfenicacidand sulfenamide configurations) which react with

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

a cysteine group in H^+/K^+ ATPase, thereby inhibiting the ability of the parietal cells to produce acid. AstraZeneca has also developed esomeprazole (Maximum) which is a eutomer, purely the (*S*)-enantiomer, rather than a race mate like omeprazole.[8]

Fluconazole

Fluconazole is an antifungal medication used for a number of fungal infections. This includes candidiasis, blast mycosis, coccidiodomycosis, cryptococcosis, histoplasmosis, dermatophytosis, and pityriasisversi colour. It is also used to prevent candidiasis in those who are at high risk such as following organ transplantation, low birth weight babies, and those with low blood neutrophil counts. It is given either by mouth or by injection into a vein. Common side effects include vomiting, diarrhoea, rash, and increased liver enzymes. Serious side effects may include liver problems, QT prolongation, and seizures. Fluconazole was patented in 1981 and came into commercial use in 1988.[9,10] It is on the World Health Organization's List of Essential Medicines, the most effective and safe medicines needed in a health system. Fluconazole is available as a generic medication. The wholesale cost in the developing world is about 0.05 to 0.10 USD per day. In the United States the wholesale price is about 1.14 to 1.75 USD per day as of 2016.[11]

Levocetirizine

Levocetirizine (as levocetirizine dihydrochloride) is a third-generation, non-sedating antihistamine, developed from the second-generation antihistamine cetirizine. Chemically, levocetirizine is simply the isolated levorotary enantiomer of cetirizine, which is sold as a racemic mixture.[12]

Erythromycin

Erythromycin is an antibiotic useful for the treatment of a number of infections. This includes respiratory tract infections, skin infections, chlamydia infections, pelvic inflammatory disease, and syphilis. It may also be used during pregnancy to prevent Group B streptococcal infection in the new-born. Erythromycin may be used to improve delayed stomach emptying. It can be given intravenously and by mouth. An eye ointment is routinely recommended after delivery to prevent eye infections in the new-born.[13,14]

Diclofenac

The primary mechanism responsible for its anti-inflammatory, antipyretic, and analgesic action is thought to be inhibition of prostaglandin synthesis by inhibition of the transiently

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

expressed prostaglandin-endoperoxide synthase-2 (PGES-2) also known as Cycloxygenase-2 (COX-2). It also appears to exhibit bacteriostatic activity by inhibiting bacterial DNA synthesis.[15]

Inhibition of prostaglandin synthesis occurs systemically resulting undesirable symptoms such as irritation of the gastric epithelium. This is the main side effect of diclofenac. Diclofenac has a low to moderate preference to block the constitutively expressed COX-1 isoenzyme (approximately 10-fold) and is said to have, therefore, a somewhat lower incidence of gastrointestinal complaints than noted with aspirin which irreversibly inhibits COX-1.[16]

Nimesulide

Nimesulide is a nonsteroidal anti-inflammatory drug (NSAID) with pain medication and fever reducing properties. Its approved indications are the treatment of acute pain, the symptomatic treatment of osteoarthritis, and primary dysmenorrhoea in adolescents and adults above 12 years old.

Side effects may include liver problems, it has a multifactorial mode of action and is characterized by a fast onset of action. It works by blocking the production of prostaglandins (a chemical associated with pain), thereby relieving pain and inflammation.[17]

Clotrimazole

Clotrimazole, sold under the brand name Canesten among others, is an antifungal medication. It is used to treat vaginal yeast infections, oral thrush, diaper rash, pityriasis versicolor, and types of ringworm including athlete's footand jock itch.It can be taken by mouth or applied as a cream to the skin or in the vagina.[18]

Albendazole

Albendazole, also known as albendazolum, is a medication used for the treatment of a variety of parasitic worminfestations.[19]

Common side effects include nausea, abdominal pains, and headaches. Potentially serious side effects include bone marrow suppression which usually improves on stopping the medication. Liver inflammation has been reported and those with prior liver problems are at greater risk. It is pregnancy category C in the United States and category D in Australia,

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

meaning it may cause harm if taken by pregnant women. Albendazole is a broad-spectrum anthelminthic agent of the Benzimidazole type.[20]

Loperamide

Loperamide, sold under the brand name Imodium among others, is a medication used to decrease the frequency of diarrhoea. It is often used for this purpose in gastroenteritis, inflammatory bowel disease, and short bowel syndrome.]It is not recommended for those with blood in the stool. The medication is taken by mouth.[21]

Common side effects include abdominal pain, constipation, sleepiness, vomiting, and a dry mouth. It may increase the risk of toxic mega colon. Loperamide's safety in pregnancy is unclear, but there is no evidence of harm. It appears to be safe in breastfeeding. It is an opioid with no significant absorption from the gut and does not cross the blood brain barrier when used at normal doses. It works by slowing the contractions of the intestines.[22]

Plan of Work

Collection of information about OTCs taken by patients in satara. Gathering useful and relevant information that is essential for careful consideration to the design of questionnaire. Prepare questionnaire for patients. Collection of answers to the questionnaire by personal visit to patients.

Questionnaire Method Was Followed

A questionnaire is a research instrument consisting of a series of questions and other prompts for the purpose of gathering information from respondents. Questionnaires have advantages over some other types of surveys in that they are cheap, do not require as much effort from the questioner as verbal or telephone surveys, and often have standardized answers that make it simple to compile data.

According to questions

1. Distribution of patient according to Age in year
2. Distribution of patient according to Sex
3. Distribution of patient according to education
4. On whom will you Trust while taking OTC drug
5. Patient experiencing any Side effect of drug
6. Patient following dose regime
7. Which information sources used by patient?

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

8. Which formulation of OTC drugs Preferred?

Basic Rules for Questionnaire Item Construction

Use statements which are interpreted in the same way by members of different subpopulations of the population of interest. Use statements where persons that have different opinions or traits will give different answers. Think of having an "open" answer category after a list of possible answers. Use only one aspect of the construct you are interested in per item. Use positive statements and avoid negatives or double negatives. Do not make assumptions about the respondent. Use clear and comprehensible wording, easily understandable for all educational levels. Use correct spelling, grammar and punctuation.

RESULT

According to survey in Satara (Wadhe) region it was found that people of age group 50 to 69 experiences acute problems (42.85%) like illness, headache, joint pains and acidity etc. Males took more OTCs (64.28%) than females (35.71%) because from survey it was observed that male has to do hard work, also are having roles and responsibilities, they usually having task to seat in front of PC in industry, so they need to take pain killers and antacid frequently. The patient who took more OTCs was mostly businessman (34.28%) as compared to other occupation because businessman has to manage everything in his business and they are having less time than salaried peoples. Most of people prefer to trust pharmacist (45.71%) while taking OTC drugs rather than doctor, friends and neighbours because it's time saving

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

and most often people didn't experience the side effects of drugs(86.85%) but very few experienced side effects (13.14%) such as fever, acidity, skin itching and loss of appetite.

Most of patient followed the dose regime (81.71%) and less percentage of patient didn't follow the dose regime (18.28%) because they didn't remember to take medicine due to their busy schedule. According to survey in Satara (Wadhe) region it was found that amongst several OTC drugs Omeprazole was frequently taken by the patient than any other drugs because most of the people were having problems like acidity, burning sensation in stomach and chest etc.

CONCLUSION

According to survey mostly people above 50-69 of Age. They patient take OTCs and those people OTC as they think that OTC's has less side effect.

Many people follow dose regime while taking OTC drugs. Patient believes on pharmacist for consulting taking OTC's drug from the survey in (Wadhe) Satara region it was conclude that Omeprazole is mostly used OTC Drug.

ABSTRACT

Sustained drug release formulations are quite helpful in treating chronic diseases. Matrix tablets have been the most likely forms of sustained drug release forms given by oral route. Matrix tablets work by maintaining a constant plasma drug concentration and sustains the rate of release of drug over time and produces therapeutic action for prolonged time period. Extended release plays an important role in formulations having the shorter half-life and high dosing frequency. The matrix controls the rate of release of the drug. Retardants like hydroxy propyl methyl cellulose (HPMC), polyglycolic acid, poly methyl methacrylate are used. The drug is embedded into a matrix core of the retardant. The matrices used may be hydrophobic, bio degradable or mineral types. Different classes of polymers are used in controlling the release of drugs in matrix tablets which may be formulated by wet granulation or direct compression methods. The mechanisms involved in drug release in matrix tablets include both dissolution-controlled and diffusion-controlled. Thus, matrix tablets improve patient compliance by reducing the frequent administration of drug and produce better therapeutic efficacy.

KEYWORDS: Sustained release, Matrix, Polymers.

INTRODUCTION[1,2]

The best route of administration of drugs among all other routes is oral route of Administration. This is because of advantages like low manufacturing cost, ease of administration etc. Many researchers on Rapid and novel delivery had taken place over the past many years. The objective of any drug delivery system is to produce a therapeutic effect

DIRECTOR
Yashoda Technical Campus
Satara

in the specific site to maintain the aspired drug concentration. For the release of medication for a long period of time After administration of a single dose. Sustained release Matrix tablets are used. Matrix tablets are the best commercial affordable sustained action drugs as they can accommodate large doses of drugs, no special requirements while manufacturing. Sustained release matrix type drug delivery system is the novel drug delivery system (NDDS) which plays an important role in improving the therapeutic effectiveness of the drugs by providing controlled, sustained release and by targeting to the desired site. A constant drug level is maintained for a specific period of time so that the adverse effects are cut down. The basic principle of sustained release drug delivery system is to enhance the pharmacokinetic and pharmacodynamic as well as biopharmaceutical properties in a way where its use is maximized, the side effects are cut down and the disease is cured efficiently when compared to conventional dosage forms.

The dosing frequency is reduced with SRDDS As these optimise pharmacokinetic, biopharmaceutics and pharmacodynamic properties of the drug compared to conventional doses forms. Conventional methods and complex procedures like coating and pelletization is not used in the manufacture.

Advantages[1,2,6]

- Therapeutic concentrations Maintain rate constant levels.
- Drug concentration in blood is uniform.
- Reduction in frequency of administration of dose.
- Ease of manufacturing and cost efficient.
- Accumulation of drug is reduced as the frequency of Administration is less.
- The deficiency in treatment can be improved.
- Compliance problems of the patients are reduced.
- Maximizing bioavailability and minimising local side effects.

Disadvantages[3,4]

- Cost of production is high compared to conventional doses form.
- In vivo and vitro correlation is poor.
- First pass metabolism has increased potential.

Rationale of Developing Sr Material Dds[15,19]

- Reduction in truck frequency.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

- Reduction of toxicity.
- The activity of a drug having less half life is increased.
- Stabilise plasma level drug concentration.

Principle of Sustained Release Drug Delivery Systems[5,8,9]

The active ingredients are released into and absorption pool by the conventional dosage forms. The solution of drug at absorption site is known as absorption pool. Ke,Kr&Ka are first order rate constant of drug elimination, drug release and drug absorption . In conventional doses form drug release immediate showing that Kr>>>>Ka. But Kr <<<< Ka for non immediate release dosage forms, i.e., The rate limiting step is Release of drug doses form. Zero order kinetics is seen and that is shown by the equation.

$$Kr^{\circ} = \text{Rate In} = \text{Rate Out} = KeCd\ Vd$$

Where, K: Zero-order rate constant for drug release- r°Amount/time, K : First-order rate constant for overall e drug elimination-time, C: Desired drug level in the d body – Amount/volume, and V: Volume space in d 4 which the drug is distributed in litre.

Factors Considered In Dosage Form Design[7,11,12]

There are mainly 2 kinds of factors that effect the dosage form design. They are divided into:

1. **Biological factors**

a. First pass effect: Drugs which suffer an extensive first pass effect shows retarded release rate. This retarded release rate affects the bioavailability.

b. Half life: The half-life of a drug is the measure of its time of residence in the body. If the medication has a short half-life (less than 2 hours), a prohibitively large amount of the drug may be found in the dosage form. On the other hand, a drug with a half-life of removal of eight hours or more is adequately maintained in the body when administered in traditional doses and continuous delivery of drugs systems

c. Adverse effects: Prolonging the drug release may develop undesirable adverse reactions.

d. Absorption and solubility: absorption and solubility both are interlinked. incorporation of drugs which are poorly water soluble can cause the reduction in overall absorption efficiency.

2. Physiochemical Factors

a. **Drug stability:** The important factor in oral dosage forms is the loss of medication in the GI tract by means of acid hydrolysis and/or metabolism. While a drug undergoes degradation in solid states at a much slower rate than a suspended or solution substance. It

DIRECTOR
Yashoda Technical Campus
Satara

is possible to significantly improve the relative bioavailability of a medication that is toxic in the stomach; the most effective control unit would be one that activates its substance only in the intestine.

b. **Aqueous solubility & Pka:** A medication to be absorbed and dissolved in the aqueous phase adjacent to the route of administration site and then partitioned into the absorbing membrane. Two of the most important physicochemical properties of a drug that affect its absorption activities are its aqueous solubility and, if it is soft acid, its pKa. Such properties reward a dominant role in the success of controlled release schemes. Drugs with high aqueous solubility have poor degradation levels and are typically susceptible to oral bioavailability tribulations.

c. **Partition Coefficient:** It is the ratio of the drug in the oil phase to that of the aqueous phase. Drugs having higher partition co efficient are not suitable for oral SRDDS as they won't partition out of the lipid membrane once it gets in the membrane . It can be calculated by the formula

$$K = Co / Cw$$

Co = Equilibrium concentration in organic phase

Cw= Equilibrium concentration in aqueous phase

d. **Diffusivity and molecular size:** The membrane cavitie's size and shape influences the diffusivity. Ntermediate molecular weight drug diffusion coefficient is 100-400 Daltons; 10-6-10-9 cm2/sec is due to flexible polymer array. For drugs having molecular weight > 500 Daltons, the diffusion coefficient in many polymers are very less i.e. less than 10-12 cm2/sec. Proteins and peptides are examples of drugs that are difficult to control drug release level from dosage form.

Requirements To Be Met To Incorporate Drug Into Sustain Release Dosage Form[17,18]

Both the physiochemical and pharmacokinetic properties had to be considered while incorprating the drug into SRDDS:

Table No 1: Physicochemical Parameters for Drug Selection.

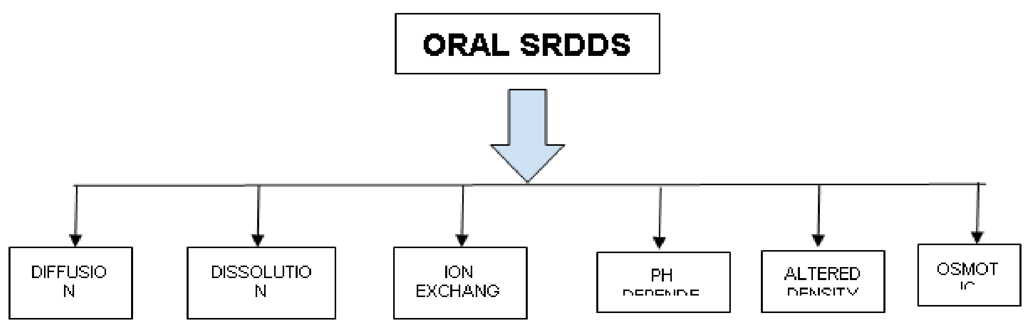
Parameters	Criteria
Molecular size	< 1000 Daltons
Aqueous Solubility Apparent partition coefficient	More than 0.1 mg/ml for pH 1 to pH 7.8 High
Absorption mechanism	Diffusion
General absorbability From all GI segments	Release Should not be influenced by pH and enzymes

TECHNICAL CAMPUS 6757 SATARA YASHODA
DIRECTOR
Yashoda Technical Campus
Satara

Table No.2: Pharmacokinetic Parameters for Drug Selection.

Parameters	Comment
Elimination half-life	Between 2 to 8 hrs
Absolute bioavaliability	Should be 75% or more
Absorption rate constant (Ka)	Must be higher than release rate
Apparent volume of distribution(Vd) Required for design	Larger Vd and MEC, Larger will be the required dose
Total clearance	Not depend on dose
Elimination rate constant	Required for design
Therapeutic concentration (Css)	The lower Css and smaller Vd, the loss among of drug required.
Toxic concentration	Apart the value of MTC And MEC safer the dosage form

Formulation Strategies[13,14,16]



1. **Dissolution sustained systems:** A product that naturally retains this drug at a slow dissolution rate and reduces its dissolution rate by sufficient salt or derivative formation for those drugs with high water solubility. Generally speaking, these devices are used in the processing of enteric coated dosage forms.Stomach safety from the effects of drugs like Aspirin is used, a coating that dissolves in natural or alkaline water. It delays drug release from the dosage process until the lower pH of the intestine is achieved.
2. **Diffusion sustained system:** It involves the passage of drug molecules from higher concentration to the lower concentration. The flux of drug is given by

   J= - D dc/dx

   D = diffusion coefficient in area/ time dc/dx = change of concentration 'c' with distance ‘x’
3. **pH– Independent formulations:** Maintain the constant pH , help to make pH-independent drug release substitutes such as amino acid salts, citric acid, phthalic acid, phosphoric acid and tartaric acid applied to the formulation. Preparation of buffered sustained release formulation is generally done by combining a simple or acidic product with one or more buffering agents, granulating with suitable pharmaceutical excipients, and covering with permeable film forming polymer with gastrointestinal fluid. As

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

gastrointestinal fluid permeates through the membrane, the buffering agents change the fluid inside by making a constant drug release rate to the correct constant pH.

4. **Ion exchange:** Using ion exchange resin is an appealing strategy for continuous drug delivery as the characteristic of drug release depends largely only on the ionic environment of drug-containing resins and is less sensitive to environmental conditions such as enzyme content and pH at the absorption site zero order release kinetic can be accomplished satisfactorily using this approach.
5. **Altered density:** Not releasing of all the drug contents in GIT causes a limited use, to over come this various methods are developed to increase the resident time in GIT.

a. **High density Approach:** The density of the pellets should be 1-4 gm/cm3 which is more than that of the stomach contents. The drug is coated with heavy inert materials like Zinc Oxide.

b. **Low density approach:** lobular shells with a thickness smaller than that of gastric fluid used as a product carrier for sustained release purposes such as polystyrene, pop rice and popcorn are all used as carriers to undercoat the surface of these empty shells with sugar or polymeric materials such as methacrylic polymer and cellulose acetate phthalate. A mixture of product with polymer such as ethyl cellulose and hydroxy propyl cellulose then coats the undercoated shell. The final product thus remains on the gastric fluid for a long time, while the substance is gradually released.

Table No.3: Examples of Polymers.

TYPE	EXAMPLE
Soluble polymers	Polyethylene glycol (PEG) Polyvinyl alcohol (PVA)
Biodegradable polymers	Polyacetic acid (PLA) Polyglycolic acid (PGA) Polyanhydrates
Hydrogels	Poly-hydroxyethyl methacrylate (PHEMA) Cross-linked polyvinyl alcohol (PVA) Polyacrylamide(PA)
Mucoadhesive polymers	Polycarbophil Sodium carboxymethylcellulose Tragacanth Methylcellulose
Non-biodegradable polymers	Cellulose acetate (CA) Polyethylene vinyl acetate (PVA) Polyether urethane (PEU)
Natural gums	Xanthan gum Guar gum Karaya gum Gum arabic

Classification of Matrix Tablets[10,17]

Matrix tablets can be classified as;

A) On the basis of retardant materials used :

Under this category the matrix tablets are further divided into 5 types:

a) Hydrophobic matrices (plastic matrices)
b) Lipid matrices
c) Hydrophilic matrices
d) Bio-degradable matrices
e) Mineral matrices.

B) On the basis of porosity of matrix:

a) Macroporous systems
b) Microporous systems
c) Non-porous systems.

A) ON THE BASIS OF RETARDANT MATERIAL USED

a) Plastic matrices or hydrophobic matrices

Plastic matrices were first introduced in 1959 by using hydrophobic/ inert materials. In this method; firstly, the drug was mixed with a hydrophobic polymer and then compressed into a tablet. The dispersion of the drug is achieved by the diffusion across a network of channels which exists between compact powder particles. Thus, sustained release is produced. The hydrophobic matrices are made by using polyethene, poly-vinyl chloride and acrylate polymers and their co-polymers. These matrix tablets are inert in nature due to the presence of water and gastro- intestinal fluids. The mechanism of these matrix tablets is diffusion and the liquid penetration is the rate limiting step.

b) Lipid matrices

Lipid waxes are used in the preparation of these matrices. The drug is released from these matrices through pore diffusion and erosion. The sustained release through these matrices is more sensitive to digestive fluid composition when compared to totally insoluble polymer matrix. Carnauba wax is combined with stearyl alcohol/ stearic acid to form the retardant base for most of the sustained release formulation.

c) Hydrophillic matrices

A matrix is defined as a properly mixed composite of one or more drugs using a hydrophilic polymer (gelling agent). The hydrophilic polymer matrix is often used in oral controlled drug

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

delivery because of the efficiency in obtaining a desirable drug release profile, cost effectiveness and broad regulatory acceptance. These matrices are further divided into three groups based on the polymers used;

- **Cellulose derivatives**

The polymers used in the formulation are methylcellulose 400 and 4000cps, hydroxypropylmethyl cellulose (HPMC) 25, 100, 4000 and 15000cps, hydroxyl ethyl cellulose and sodium carboxymethyl cellulose.

- ***Non-cellulose natural/semi—synthetic polymers***

Polymers of acrylic acid: The most widely used polymer under this category is carbopol-934. Other polymers include agar-agar, alginates, carob gum, molasses, polysacharrides of galactose and mannose, chitosan and modified starches.

d) Biodegradable Matrices

Polymers linked to one another via functional groups having unstable linkage in the backbone, are present in biodegradable matrices. These matrices are degraded biologically and the enzymes which are generated by the surrounding living cell erode the matrix. The degradation can occur by non enzymatic process by metabolising the oligomers and monomers. Natural polymers include proteins and polysaccharides. It also contains certain modified natural polymers. The synthetic polymers include aliphatic polyesters and poly anhydrides.

e) Mineral matrices

Mineral matrices contain polymers obtained from different species of seaweeds. Alginic acid, a hydrophilic carbohydrate obtained from species of brown seaweeds by using dilute alkali, is an example of mineral matrices.

B) ON THE BASIS OF POROSITY OF MATRIX

In this the drug molecules diffuse across the matrix and produce sustained release.

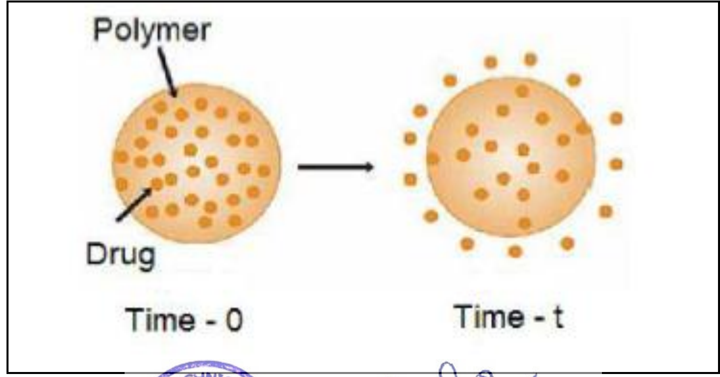

Figure: Diffusion of Drug Across The Matrx.

6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

The matrix is further divided into 3 types.

a) Macro porous systems

The pores of this kind of matrix range from 0.1µm to 1µm which is larger than the diffusant molecule size. In this type of system permeation of drug occurs through these pores.

b) Micro porous systems

Permeation of drug molecules occurs through pores of sizes ranging from 50-200Å.

c) Non-porous systems

These systems have no pores. The diffusion of molecules occurs through network meshes. There is no pore phase where as the polymeric phase is present.

CONCLUSION

The review of the above article is mainly focused on the formulation and uses of the SRDDS. It concludes that the use of matrix tablets was really helpfull to over come the patient complience problems which are associated with the conventional dosage forms . The cost of production of the matrix tablets is also under control. Due the use of these tablets the daily required frequence of the doses was also reduced.

ABSTRACT

The aim of present work was to develop carboxymethylcellulose (CMC)-polyvinyl alcohol (PVA) hydrogel films for extended delivery of water soluble basic drug, using citric acid (CA) as a cheap and non-toxic crosslinking agent. Gentamicin sulfate (GTM) was used as a model drug. The hydrogel films were evaluated for carboxyl content, tensile strength, swellability, drug loading and release, hemocompatibility and characterized by ^{13}C-CP-MAS NMR, ATR-FTIR and thermal analysis (TGA and DSC). The instrumental analysis helped to confirm the formation of ester crosslinks. CMC-PVA hydrogel films exhibited greater carboxyl content, tensile strength and swellability than the pure CMC hydrogel films. The GTM loading increased with an increase in the amount of PVA in the hydrogel films. The CMC-PVA hydrogel films showed propensity to extend the release of GTM above 24 h. Hemolysis assay revealed the hemocompatible nature of the hydrogel films. Altogether, the CMC-PVA hydrogel films can be envisioned as promising biomaterial for the delivery of water soluble basic drugs.

1. Introduction

Hydrogels are the crosslinked polymeric network structures capable of absorbing large amount of water without dissolving in it. Due to their rubbery consistency and water retention capacity which resembles natural tissues, hydrogels are mostly used in the field of biomedical and pharmaceutical sciences [1]. The hydrogels can be prepared from synthetic or natural polymers using physical, chemical or radiation crosslinking. The hydrogels prepared using synthetic polymers exhibit good mechanical properties; however, most of them do not support cell adhesion and tissue formation. On the other side, natural polymer based hydrogels are biocompatible, biodegradable and support cellular activities [2]. In recent years, extensive research has been carried out to develop hydrogel-based drug delivery systems using natural polymers [3–9]. Amongst the natural and semi-synthetic polymers, cellulose and its water soluble derivatives are mostly preferred because of the abundance of cellulose on earth and relatively low cost of the cellulose derivatives than the synthetic polymers [10].

Carboxymethylcellulose (CMC) is highly hydrophilic cellulose derivate [11,12]. It is widely used as thickening and suspending agent in the food and pharmaceutical industry. The scientists dealing with the hydrogels for drug delivery are interested in CMC due to its good swellability, non-toxicity and modifiability [13]. Large number of reports are available on the preparation of CMC-based hydrogels for the delivery of water soluble drugs [14–17]. In most of these cases, the crosslinking agents used are either expensive or toxic [18]. In last few years, citric acid (CA) has emerged as a non-toxic and cheap crosslinking agent. At high temperatures, it esterifies the hydroxyl groups present on the nearby polymer chains and forms the crosslink. For preparation of CA crosslinked hydrogels of alone CMC, excess of CA is required as CMC shows poor crosslinking due to electrostatic repulsion in between the carboxylate ions present on the adjacent polymer chains. This leads to the formation of intramolecular crosslinks. Therefore, Demitri and co-workers (2008) fabricated CA crosslinked superabsorbent hydrogels by combining CMC with hydroxyethylcellulose (HEC) for improving the intermolecular crosslinking [19]. These hydrogels were intended for agricultural application. The hydroxyl groups attached to the oxyethylene chains in HEC are highly reactive and hence, can readily undergo esterification reaction with CA and facilitate the formation of CMC hydrogels with good integrity. Very few works are reported on the use of CA crosslinked CMC based hydrogels in drug delivery. Mali et al. (2018) have prepared hydrogel films comprised of CMC and tamarind gum (TG) for delivery of moxifloxacin HCl. Furthermore, we have prepared CMC-polyethylene glycol

(PEG) hydrogel films for the improvement of loading and extended release of hydrophobic drugs [20].

Polyvinylalcohol (PVA) is a synthetic polymer which is biocompatible, biodegradable and widely used in pharmaceutical, bio-medical and food sectors [21]. The large number of reactive hydroxyl groups present on the polymer chain of PVA makes it suitable for the synthesis of hydrogels, mostly by physical [22–24] or chemical [25–28] crosslinking. The CA crosslinked PVA films have been prepared for antimicrobial packaging purpose [29]. Taking this into consideration, PVA can be used as a better alternative to HEC while preparing CMC hydrogels since the amount of PVA required for the formation of intact hydrogels will be less. In previous studies, CMC-PVA hydrogels have been prepared for drug delivery [30–32]; however, CA crosslinked CMC-PVA hydrogels have not been investigated for their ability to control the drug release.

The present work deals with the preparation of CMC-PVA hydrogel films using CA as crosslinking agent, for the delivery of water soluble basic drugs. Our objective was to develop the inexpensive hydrogels with good drug loading efficiency and ability to control the release of water soluble drugs, so that they can be used as implants or wound dressings. As the crosslinks consist of COOH branching which usually ionize at physiological pH, the prepared hydrogel films could be more favorable for the delivery of basic drugs. Along with an improvement in the extent of crosslinking, the large number of OH groups on PVA chains may also contribute towards the enhancement of swellability of the CMC-PVA hydrogel films. Also, the OH groups of PVA and COOH groups of CA crosslinks may hold the weakly basic drug molecules (pKa > physiological pH) within the hydrogel matrix by hydrogen bonding and electrostatic interactions. Taking these aspects into account, we hypothesize that the CA crosslinked CMC-PVA hydrogel films may enhance the loading as well as control the release of water soluble basic drug.

The hydrogel films were suitably characterized to confirm the formation of ester crosslinks. The films were loaded with gentamicin sulfate (GTM, model water soluble basic drug) and evaluated for drug release. Hemolysis assay was performed to test the hemocompatibility of the hydrogel films.

2. Materials and methods

2.1. Materials

Gentamicin sulfate (GTM) was obtained as a gift sample from RP Pharma, Mumbai, Maharashtra (India), sodium carboxymethylcellulose (CMC, degree of substitution: 0.7, average molecular weight: ~250000) was purchased from Sigma Aldrich, Mumbai, Maharashtra (India), polyvinyl alcohol (PVA, MW: 115,000 Da, Hydrolysis: 98–99%) and citric acid (CA) were purchased from Loba Chemie, Mumbai, Maharashtra (India). All other chemicals were of analytical grade and used as received.

2.2. Preparation of CMC-PVA hydrogel films

The CMC-PVA hydrogel films were prepared by modifying the previously reported method [20]. Initially, a suitable amount of PVA was dissolved in distilled water by heating on a water bath at 80 °C for 20 min, under reflux. The obtained PVA solution was cooled to room temperature followed by addition of CMC and CA (% of polymer amount). This mixture was stirred on a magnetic stirrer to obtain a homogenous solution and placed overnight in a closed compartment in order to remove the air bubbles. The clear solution was poured into the petri dish of specific diameter (9 cm) and dried in the hot air oven at 50 °C for 24 h. The dried CMC-PVA-CA film was cured at 145 °C for 5 min, to promote the crosslinking reaction in between the polymer chains. The cured film was washed with distilled water in cycles until the pH of water became nearly neutral. Finally, the swollen film was washed with isopropyl alcohol to remove the water entrapped within the matrix. The shrunken film so obtained was dried in the hot air oven at 40 °C for 24 h and stored in a desiccator. The concentration of PVA was varied in order to study their effect on the film properties (see Table 1).

Table 1
CMC-PVA hydrogel films containing different concentrations of PVA.

Batch	CMC (%w/v)	PVA (%w/v)	CA (%)[a]
HF0	2	0	20
HF0.5	2	0.1	20
HF1	2	0.2	20
HF2	2	0.4	20
HF3	2	0.6	20

[a] Indicates % of the polymer amount.

2.3. Determination of carboxyl content

The total carboxyl content of hydrogel films was determined by acid-base titration [33,34]. CO_2 free water was used for the preparation of titrant (0.1 N HCl) and analyte (0.1 N NaOH). A specific amount of hydrogel film was added to the adequate volume of 0.1 N NaOH and stirred on a magnetic stirrer for 2 h. The hydrogel films disintegrated and dissolved completely due to sodium hydroxide aided breaking of the ester crosslinks. Also, sodium hydroxide reacts with the free carboxylic acid groups to form sodium citrate. The excess amount of 0.1 N NaOH was titrated with 0.1 N HC1 using phenolphthalein indicator. The carboxyl content in milliequivalents per 100 g of hydrogel film was determined using following formula:

$$Total\ carboxyl\ content\ (mEq/100\text{g}) = \frac{(V_b - V_a) \times N_{HCl} \times 100}{W_{HF}} \quad (1)$$

where, N_{HCl} is the normality of HCl (mEq/mL), V_b and V_a are the volumes of HCl in absence and presence of hydrogel film, and W_{HF} is the weight of hydrogel sample (g).

2.4. Characterization of hydrogel films

Solid state ^{13}C cross-polarization-magic angle spinning (^{13}C CP-MAS) NMR spectra of CMC, PVA, CA and CMC-PVA hydrogel film (HF3) was recorded using JEOL-ECX400 spectrometer operated at 400 MHz, with a spinning speed of 10 KHz. The contact time, relaxation delay and sweep width were fixed at 3.5 ms, 5 s and 35 kHz, respectively. The external hexamethylbenzene standard methyl resonance at 17.3 ppm was used for the calibration of chemical shifts.

The infrared spectra of CMC, PVA, CA and hydrogel films were obtained using ATR-FTIR spectrophotometer (MIRacle-10, IR Affinity-1, Shimadzu, Japan). The samples were transferred to the ATR compartment and spectra were obtained in the range of 400–4000 cm^{-1} (scans = 25; resolution = 4 cm^{-1}).

CMC, PVA and hydrogel films (HF0 and HF3) were subjected to the thermal analysis (TGA and DSC) using SDT Q600 V20.9 Build 20 (TA instruments, Water, USA). Samples (approx. 5 mg) were taken in the sample pan and were heated from 30°C to 300 °C, at the heating rate of 10 °C/min, under nitrogen atmosphere (purge rate = 10 mL/min).

2.5. Determination of tensile strength

The tensile strength of the hydrogel films was tested using Texture Analyzer (CT 3-10,000, Brookfield, WI) [35,36]. The analyzer was fitted with a 10 kg load cell. Each film was cut into 2 cm × 1 cm size and clamped on probe TA-DGA (hold time = 60 s). Holding the lower clamp stationary, the hydrogel film was pulled apart with the help of upper clamp with a speed of 2 mm/s to a distance of 6 mm (trigger load = 0.05 N). The force at which the film broke was recorded and the

DIRECTOR
Yashoda Technical Campus
Satara

tensile strength of the hydrogel films was determined as given below.

$$Tensile\ strength\ (kg/mm^2) = \frac{Force\ at\ break}{Initial\ cross - sectional\ area} \quad (2)$$

2.6. Determination of swelling behavior

The swelling behavior of the hydrogel films was studied in phosphate buffer (pH 7.4) at 37 °C. The hydrogel films (~0.2 g) were immersed in the beaker containing 20 mL buffer. After 30 min, swollen film samples were removed from the buffer and their surface was blotted with tissue paper to remove the excess water followed by weighing on the analytical balance (Shimadzu, AX 120). The hydrogel films were reimmersed in the buffer and the procedure was repeated at specific time intervals till 24 h. The swelling ratio of the hydrogel films was determined by using eq. no. (3).

$$Swelling\ ratio\ (g/g) = \frac{W_s - W_d}{W_d} \quad (3)$$

where, W_s is the weight of swollen hydrogel film and W_d is the weight of dry hydrogel film. The measurements were taken in triplicate [3,37].

2.7. GTM loading

In order to load GTM into the hydrogel films, the preweighed films (~100 mg) were allowed to swell in the aqueous GTM solution (10 mg/mL) till equilibrium. The swollen hydrogel films were dried at room temperature for 24 h. In order to determine the amount of GTM loaded in the hydrogel films, they were initially cut into fine pieces. The specific amount of these pieces were added to 50 mL phosphate buffer (pH 7.4) and stirred for 48 h. Thereafter, the amount of GTM released in the buffer was determined using colorimetric estimation as GTM shows negligible UV absorbance [38]. Briefly, standard solutions of GTM (5–9 μg/mL) were prepared in phosphate buffer (pH: 7.4). One mL of these solutions was taken in the 10 mL volumetric flasks followed by addition of 0.5 mL of 2 M H_2SO_4 and 2 mL of 5×10^{-4} M $KMnO_4$ solutions. The obtained mixtures in the flasks were heated on the water bath for 25 min, cooled to room temperature and 2.5 mL of 5×10^{-4} M methylene blue was added to the respective flasks. The volume was adjusted to 10 mL with buffer and the mixtures were subjected to spectrophotometric analysis (UV1800, Shimadzu, Japan) at 664 nm. The calibration curve so obtained was used further for determination of GTM released in the buffer [39].

2.8. In vitro GTM release

The in vitro drug release study was performed by modifying the previously reported methods [40,41]. The GTM loaded hydrogel films of known weight were placed in screw-capped vials containing 10 mL of phosphate buffer (pH: 7.4). These vials were kept in the constant temperature bath (without agitation) at 37 °C. At specific time intervals, aliquots were withdrawn and suitably diluted followed by spectrophotometric analysis (UV1800, Shimadzu, Japan) using colorimetric method as described above. All the measurements were taken in triplicate.

2.9. Hemocompatibility study

Recently, biocompatibility of natural polymer based biomaterials was tested by few authors using hemolysis assay [5,7,9]. As the CMC-PVA hydrogel films can be used as implants or wound dressings, they were examined for hemocompatibility using hemolysis assay with slight modification [42]. The hydrogel films were cut in order to get surface area of 2 cm^2. These films were allowed to swell in the phosphate buffer saline (PBS) maintained at 37 °C for 1 h. Thereafter, PBS was removed and 0.5 mL of human CPD (citrate-phosphate-dextrose) blood was added over the films. After 20 min, the hemolysis process was stopped by addition of 4 mL, 0.9% NaCl saline followed by incubation of the samples for 1 h at 37 °C. The incubated samples were centrifuged at 4000 rpm for 10 min and the supernatant was subjected to spectrophotometric analysis (UV1800, Shimadzu, Japan) at 545 nm. The hemolysis (%) was determined using following formula:

$$Hemolysis\ (\%) = \left(\frac{A_{Test\ sample} - A_{-ve\ control}}{A_{+ve\ control} - A_{-ve\ control}}\right) \times 100 \quad (5)$$

where, A = absorbance.

+ve control = mixture of 0.5 mL, human CPD blood and 4 mL double distilled water
- ve control = mixture of 0.5 mL, 0.9% NaCl saline and 4 mL double distilled water

2.10. Statistical analysis

The experimental data were compared by one-way analysis of variance (ANOVA) using GraphPad Prism 5.01 software. The statistical significance was considered at $p < 0.05$.

3. Results and discussion

3.1. Formation of CMC-PVA hydrogel films

The CMC-PVA hydrogel films were obtained by esterification-crosslinking mechanism. At high temperatures, CA gets converted into an anhydride which esterifies the OH groups of CMC and PVA. This leads to the formation of ester crosslinks in between the polymer chains. Fig. 1 displays the possible reaction involved in the formation of CMC-PVA hydrogel films. Besides CMC-PVA crosslinks, there may be presence of CMC-CMC and PVA-PVA crosslinks in the hydrogel matrix. The concentration of CA, curing temperature and curing time required for the formation of the hydrogel films was decided on the basis of preliminary studies. The minimum concentration of CA needed for the formation of hydrogel film with good matrix integrity was 20%. On increasing the CA concentration above 20%, the hydrogels exhibited poor swellability. Although the previous reports indicate the formation of hydroxyl acid crosslinked cellulose-based hydrogels at the curing temperature of 80 °C, the time required for the curing was more (> 10 h) [19,43]. In the preliminary studies, we found that the curing temperature of 145 °C and curing time of 5 min was sufficient to obtain the hydrogel films with desired swellability and integrity. However, increasing the curing temperature and curing time above 145 °C and 5 min led to the development of yellowish color on the films, possibly due to thermal decomposition. The obtained hydrogel films showed an average thickness in the range of ~130–135 μm.

3.2. Total carboxyl content

Table 2 represents the total carboxyl content of the CMC-PVA hydrogel films. It was observed that an increase in the amount of PVA up to 0.2% increased the carboxyl content of the hydrogel films. In case of CMC hydrogel film (HF0), the carboxyl content was found to be less as compared to the CMC-PVA hydrogel films. This indicates that CMC hydrogel film showed minimum number of interpolymer crosslinks than the CMC-PVA hydrogel films. This can be attributed to the degree of substitution (DS) of CMC i.e. 0.7 and weak electrostatic repulsion in between the adjacent CMC chains due to presence of few COO^- groups in the feed of HF0. The DS equivalent to 0.7 suggests that very few primary hydroxyl groups (C6-OH) are available on CMC for taking part in the esterification reaction. On the other hand, the weak electrostatic repulsion in between the adjacent CMC chains may inhibit the CA from linking them. As a result, most of the CA may remain unutilized. PVA

DIRECTOR
Yashoda Technical Campus
Satara

Fig. 1. Reaction involved in the formation of CMC-PVA hydrogel films.

consists of large number of secondary hydroxyl groups which are highly reactive [44]. These hydroxyl groups can readily participate in the esterification reaction. On inclusion of PVA in the feed, the CA which was unutilized in case of CMC hydrogels will get involved in the formation of CMC-PVA and PVA-PVA crosslinks. This may be the reason behind increase in the carboxyl content of HF0.5 and HF1. However, further increase in the amount of PVA (HF2 and HF3) led to decrease in the carboxyl content possibly due to decrease in the crosslinking density of the hydrogel films caused by dilution effect. In case of batch HF1 (0.2% PVA), there might be a possibility of maximum consumption of the citric acid in the formation of crosslinks. As a result, further increase in the concentration of PVA may increase the distance in between the adjacent crosslinks within the hydrogel films and reduce the crosslinking density. Another reason behind decrease in the crosslinking density on increasing the concentration of PVA beyond 0.2% may be insufficient physical interactions in between CMC and PVA at high concentrations of PVA. HF3 containing high amount of PVA showed low carboxyl content than HF1 and HF2 but it was greater than HF0.

Table 2
Total carboxyl content (TCC), tensile strength (TS), equilibrium swelling ratio (ESR), GTM loading and hemolytic activity of the CMC-PVA hydrogel films.

Batch	TCC (mEq/100 g)	TS (kg/mm^2)	ESR (g/g)	GTM loading[a]	Hemolysis (%)
HF0	229.55	3.13 ± 0.16	50.51 ± 3.63	137.51 ± 1.56	4.15 ± 0.22
HF0.5	391.20	3.38 ± 0.09	53.55 ± 2.75	162.24 ± 2.12	4.52 ± 0.83
HF1	417.35	3.54 ± 0.12	59.75 ± 1.90	190.40 ± 1.04	4.02 ± 0.71

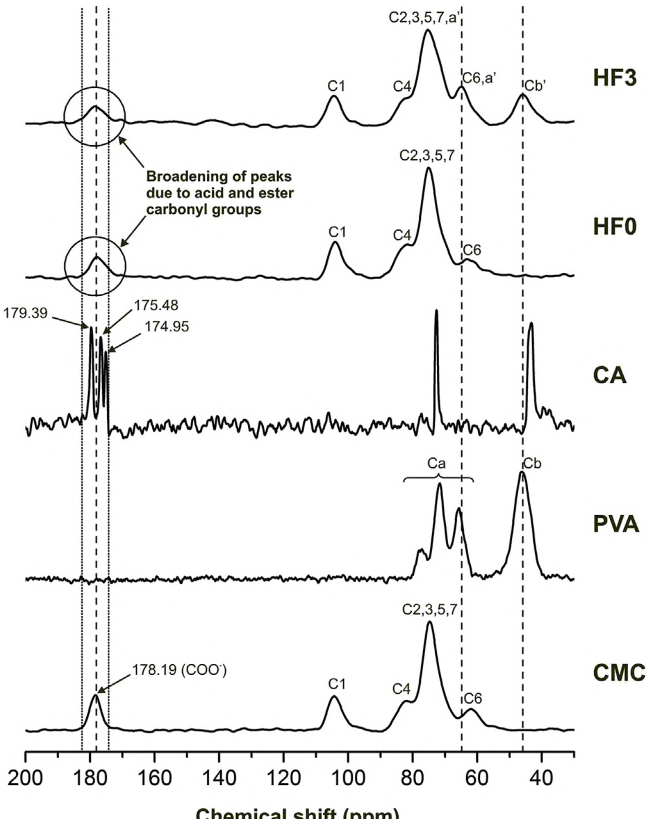

Fig. 2. Solid state ^{13}C-NMR of CMC, PVA, CA, HF0 and HF3.

3.3. Solid state ^{13}C-NMR analysis

The solid state ^{13}C-NMR spectrum of CMC, PVA, CA, CMC hydrogel film (HF0) and CMC-PVA hydrogel film (HF3) is shown in Fig. 2. The symbolic representation of various carbon atoms of CMC and PVA is indicated in Fig. 1. The carbon atoms of CMC showed a signals in the region 56-66(C6), 68-80(C2,3,5,7), 81-89(C4), 98-109(C1) and 175-183(COO^-) ppm. The resonance peaks corresponding to the carbon atoms of PVA appeared at 46.16 ppm (Cb) and in the range of 60–80 ppm (Ca). The carbonyl carbons of citric acid showed sharp signals at 174.95, 175.48 and 179.39 ppm. The spectrum of CMC-PVA hydrogel film (HF3) showed existence of new peaks at 45.90 and 64.70 ppm which represent the peaks of PVA (Cb at 46.16 ppm and Ca at 65.64 ppm). These peaks were absent in the spectrum of pure CMC and CMC hydrogel film (HF0). The remaining peaks of PVA were not visible in the spectrum of HF3 because they overlapped with the peaks of carbons belonging to the anhydroglucose units of CMC. Besides, the sharp carboxylate carbon peak of CMC at 178.19 ppm was found to be slightly broadened towards up-field region in the spectrum of HF0 and HF3. This clearly indicates the presence of ester crosslinks in the hydrogel films.

3.4. ATR-FTIR analysis

The presence of ester crosslinks in the CMC-PVA hydrogel films was further confirmed from ATR-FTIR analysis. Fig. 3a depicts the ATR-FTIR spectra of CMC, PVA and CA, whereas spectra of hydrogel films (HF0-HF3) are presented in Fig. 3b. The spectrum of CMC showed the characteristics peaks at 3450 cm^{-1} (O-H stretching), 2920.52 cm^{-1} (C-H stretching), 1584 cm^{-1} (C=O stretching) and 1051 cm^{-1} (C-O stretching). In the spectrum of PVA, broad band was observed at 3257 cm^{-1} corresponding to O-H stretching and sharp peaks at 2929 cm^{-1} represented C-H stretching. The peaks of PVA at 1427 cm^{-1}, 1327 cm^{-1} and 839 cm^{-1} were related to the C-H bending whereas the prominent peak at 1082 cm^{-1} represented C-O stretching. The distinct IR peaks of CA were observed at 3498 cm^{-1} and 3283 cm^{-1} (O-H stretching), 1693 cm^{-1} (C=O stretching), 1199 cm^{-1} (C-O stretching) and 786 cm^{-1} (C-C stretching).

The spectrum of HF0 showed peak at 1722 cm^{-1} corresponding to the ester as well as carboxylic acid carbonyl stretching. This indicates the presence of ester crosslinks in the CMC hydrogel film (see Fig. 3b). The changes in the carbonyl peak of the hydrogel films on addition of PVA can be clearly observed in Fig. 3c. The intensity of this peak was found to be increased as we move from HF0 to HF1, which suggests an increase in the carboxyl content and hence, the extent of crosslinking of the hydrogel films as the concentration of PVA is increased up to 0.2%. As the concentration of PVA was further increased (HF2 and HF3), the carbonyl peak intensity was found to be reduced. This clearly reveals that increase in the concentration of PVA reduces the crosslinking density. The results of carboxyl content determination were in accordance with this finding. It was also noticed that the carbonyl peak shifted towards lower wavenumber with increase in the amount of PVA from 0.2% to 0.6% (HF1-HF3). An increase in the hydrogen bonding interaction in between the OH groups of PVA and carbonyl groups of free acid and ester groups of the CMC-PVA hydrogel films may be responsible for this shifting. The intensity of peak at 2942 cm^{-1} was found to be increased from HF0 to HF3 (see Fig. 3b) which can be attributed to an increase in the number of CH_2 groups associated with PVA.

3.5. Thermal analysis

Fig. 4 depicts the TGA, DTG and DSC profiles of CMC, PVA, HF0 and HF3. The TGA thermogram of CMC showed two stages whereas that of PVA showed three stages of mass loss (see Fig. 4a). In case of CMC, 10.56% mass loss occurred in between 40 °C to 163 °C due to loss of moisture followed by 42.19% mass loss in the range of 253 °C–316 °C, owing to thermal decomposition of the sample. The maximum degradation temperature (T_m) of CMC was observed at 295.11 °C (see Fig. 4b). For PVA, the initial mass loss due to moisture evaporation took place within the temperature range of 60–190 °C. The major loss (61.96%) occurred in between 239 °C to 374 °C which can be ascribed to the elimination of hydroxyl groups in the form of water and formation of polyene macromolecules [45]. The T_m of PVA was noticed at 305.06 °C. In the third step (410–476 °C), decomposition of macromolecules led to the mass loss of 10.98%. The batch HF0 exhibited degradation in two stages (I: 40–174 °C; II: 223–350 °C) with total weight loss of 62.3% at 485 °C whereas HF3 showed three stages of degradation (I: 30–176 °C; II: 234–343 °C; III: 418–480 °C) to due to presence of PVA. The total weight loss for HF3 at 485 °C was found to be 67.24% which was slightly greater than HF0. Also, T_m of HF3 was found to be reduced when compared with HF0. This clearly reveals that the crosslinking density of HF3 was less than HF0.

The values of the glass transition temperature (T_g) obtained from the DSC curves of HF0 and HF3 helped to reconfirm our above statement (see Fig. 4c). The T_g of HF3 was lower as compared to HF0 indicating decrease in its crosslinking density.

Thus, the results of carboxyl content and instrumental characterization were in complete agreement with each other.

3.6. Tensile strength of hydrogel films

The tensile strength of the hydrogel films was found to be increased with increase in the concentration of PVA up to 0.2% followed by decrease (see Table 2). The reason behind low value of tensile strength of CMC hydrogel films may be the lesser extent of crosslinking. The addition of PVA not only increases the extent of crosslinking but also enhances the hydrogen bonding interaction in between unreacted OH groups of PVA and, OH and carbonyl groups of other components (i.e.

CMC and CA crosslinks) within the CMC-PVA hydrogel films [46]. This can improve the mechanical property of the hydrogel films. The batch HF1 exhibited maximum tensile strength ($3.54 \pm 0.12\,kg/mm^2$) than the other hydrogel films. As the concentration of PVA was increased above 0.2%, the tensile strength of the CMC-PVA hydrogel films was found to be reduced slightly which can be attributed to the decrease in the crosslinking density of the hydrogel films. As compared to the pure CMC hydrogel film, CMC-PVA hydrogel films exhibited better mechanical strength.

3.7. Swelling study

Fig. 5 illustrates the swelling behavior of the hydrogel films. All the films showed initial increase in the swelling ratio till equilibrium followed by erosion. The pure CMC hydrogel films (HF0) showed minimum equilibrium swelling ratio (ESR) as compared to the CMC-PVA hydrogel films (HF0.5-HF3) (see Table 2). It was noted that despite of greater extent of crosslinking than HF0, HF0.5 and HF1 showed good swelling. This can be related to the increase in the total polymer concentration where PVA chains will be arranged in between the CMC chains. Secondly, on addition of PVA, the number of free OH groups in the hydrogel film will increase which can enhance the hydrophilicity of the hydrogel films [47]. An increase in the number of unreacted hydroxyl groups can be confirmed from an increase in the intensity of O-H stretching vibrations from HF0.5 to HF3 (see Fig. 3b). The other reason behind increase in the swellability of HF0.5 and HF1 than HF0 may be introduction of highly hydrophilic carboxylic groups due to increase in the number of crosslinks. These free carboxylic groups play an important role in the formation of a polyelectrolyte network within the hydrogel films and improve the water sorption [19]. The time taken by HF1 to reach the equilibrium (5 h) was found to be more than HF0 (4 h) which can be due to greater crosslinking density in HF1. A further increase in the concentration of PVA increased the swellability of the hydrogel films (HF2 and HF3) and also reduced the time required to achieve the equilibrium. This may be due to increase in the hydrophilicity and decrease in the crosslinking density of HF2 and HF3. HF3 showed maximum ESR than the other films (see Table 2).

3.8. GTM loading and release

The GTM loading increased with increase in the swellability of the hydrogel films and hence, the amount of PVA (see Table 2). The greater

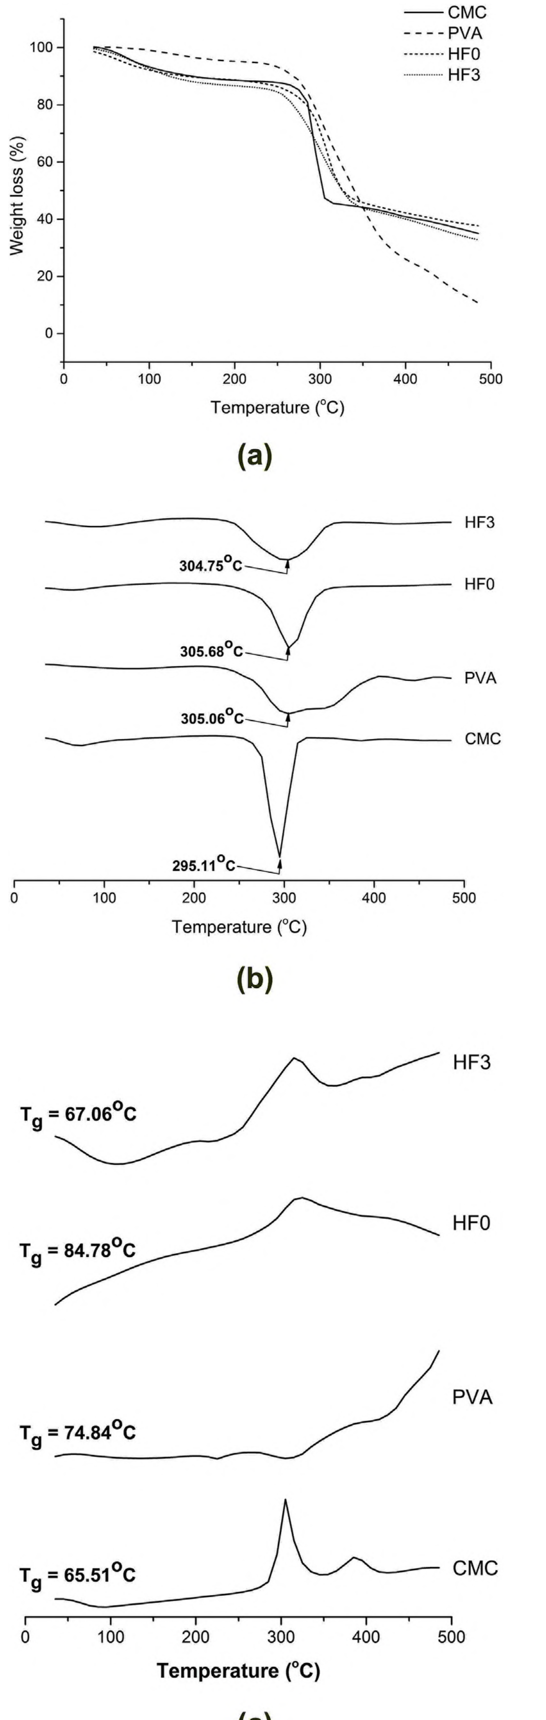

Fig. 4. TGA (a), DTG (b) and DSC (c) thermograms of CMC, PVA and hydrogel films (HF0 and HF3).

the swellability of the hydrogel films more will be their tendency to absorb the drug solution. As a result, large number of drug molecules will get entrapped in the polymeric network of hydrogels. The CMC-PVA hydrogel films showed significant improvement ($p < 0.05$) in the GTM loading than the CMC hydrogel film, with HF3 exhibiting maximum drug loading.

Besides swellability, hydrogen bonding interaction in between amine groups of GTM and hydrogel components (hydroxyl and carbonyl groups), and electrostatic interaction in between protonated amine groups of GTM and deprotonated carboxyl groups of hydrogel films may also contribute in enhancing the loading of GTM. In order to confirm the hydrogen bonding interactions, ATR-FTIR analysis of pure GTM and GTM loaded HF3 was performed (see Fig. 6). The spectrum of GTM showed absorption bands in the range of 2900–3500 cm^{-1} corresponding to N-H stretching vibrations of amino groups. Multiple peaks were found to be fused in the range of 2300–2900 cm^{-1} which represented C-H stretching and absorption due to the other components of GTM [48]. The peaks in the range of 1400–1700 indicated N-H bending, C-H stretching and C-N stretching vibrations. The strong band in the range of 900–1250 was related to C-N and C-O stretching vibrations. In spectrum of GTM loaded HF3, the N-H stretching bands of GTM nearly disappeared. Also, the broad peak of blank HF3 representing O-H stretching shifted from 3284 cm^{-1} to 3217 cm^{-1}, with decrease in its intensity. Such changes suggest the existence of hydrogen bonding interactions in between NH_2 groups of GTM and OH groups of HF3. As the number of OH groups increase from HF0 to HF3, the hydrogen bonding interactions in between GTM and hydrogel components will increase, thus enhancing the loading of GTM in the hydrogel films. The hydrogen bond formation is also possible in between amine groups of GTM and carbonyl groups of hydrogel films. The C-O stretching peak of HF3 at 1082 cm^{-1} shifted to lower wavenumber due to peak of GTM at 1037 cm^{-1}. The other peaks of GTM overlapped with the peaks of HF3 and therefore could not be distinguished.

Furthermore, electrostatic interaction in between GTM and free COOH groups of hydrogel films was possible because the drug loading was carried out in the aqueous drug solution of pH 5.8. At this pH, the amine groups of GTM undergo protonation (pKa = 8.6) whereas free carboxylic acid groups of hydrogel films are deprotonized. Consequently, electrostatic attraction will occur in between NH_3^+ groups of GTM and COO^- groups of hydrogel films, thus assisting in the drug loading improvement. As CMC-PVA hydrogel films exhibited greater carboxyl content than the pure CMC hydrogels, such electrostatic interaction will be more favored in their case.

An increase in the GTM loading in the CMC-PVA hydrogel films inspite of decrease in their carboxyl content indicates that the drug loading was mainly dependent upon swellability and hydrogen bonding.

Fig. 7 demonstrates the drug release profile of the GTM loaded hydrogel films. HF0 showed a noticeable burst release of GTM (26.96 ± 1.48%) within first hour, followed by rapid release. During drying of the drug loaded hydrogel films, most of the drug molecules diffuse along with the solvent towards the surface of the hydrogel films. As a result, a large number of drug molecules concentrate near the surface of the hydrogel films resulting into burst release. An increase in the concentration of PVA reduced the burst release due to an increase in the interaction between GTM and PVA (hydrogen and electrostatic bonding) within the hydrogel films. This will lead to maximum entrapment of GTM within the core of hydrogel matrix and concentration of the GTM molecules near the hydrogel surface will be reduced, thus reducing the burst release in case of CMC-PVA hydrogel films.

In case of HF0, nearly complete GTM release (98.90 ± 1.74%) occurred in 12 h. The CMC-PVA hydrogel films were capable of controlling the release of GTM above 24 h. The retardation of drug release was observed as we move from HF1 to HF3 which can again be attributed to the intermolecular interactions which can restrict the rapid transit of the GTM molecules from the hydrogel matrix into the release

medium. HF3 showed maximum drug release retardation (80.29 ± 2.22% at the end of 24 h) as compared to HF0.5 (98.41 ± 2.14% at the end of 24 h), HF1 (94.03 ± 2.86% at the end of 24 h) and HF2 (86.54 ± 1.94% at the end of 24 h). As HF3, showed maximum drug loading and had greater tendency to control the release of GTM than the other batches, it can be considered as optimized hydrogel film.

3.9. Hemocompatibility

The results of hemolysis assay are shown in Table 2. It was observed that the hemolysis due to pure CMC and CMC-PVA hydrogel films was less than 5% indicating hemocompatible nature of the hydrogel films [7]. From the values of percent hemolysis, it was difficult to determine the effect of PVA on the extent of hemolysis.

4. Conclusion

The CA crosslinked CMC-PVA hydrogel films were formed by esterification-crosslinking mechanism. As the concentration of PVA in the feed was increased, the carboxyl content increased initially indicating increase in the crosslinking density, followed by decrease due to dilution effect. The presence of ester crosslinks and extent of crosslinking was confirmed from ATR-FTIR, solid state ^{13}C NMR and thermal analysis. The CMC-PVA hydrogel films showed good mechanical strength than the pure CMC hydrogel films. An increase in the amount of PVA in the hydrogel films improved the swellability of the hydrogel films and also enhanced the loading of GTM. CMC-PVA hydrogel films were capable of extending the release of GTM above 24 h. The prepared films were hemocompatible. Thus, CA crosslinked CMC-PVA hydrogel films exhibited potential to be used as an efficient and cheap biomaterial for delivery of water soluble basic drugs; however this can be confirmed only after conduction of few more tests such as MTT assay and in *vivo* studies.

Financial source of support

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

Conflicts of interest

Authors declare no conflict of interest.

Acknowledgement

Authors are thankful to the President of YSPM's Yashoda Technical Campus, Satara, for providing necessary facilities in order to carry out this research work. We also acknowledge Shivaji University, Kolhapur and NMR facility centre of Indian Institute of Science, Bangalore for the instrumental analysis.

ABSTRACT

Introduction: At present days there was considerable attention has been taken to develop lipid based pharmaceutical preparation which improves solubility as well as permeability leads to improve oral bioavailability of poorly water soluble drug with a system known as self nano-emulsifying drug delivery system. **Materials and Methods:** The SNEDDS of garlic oil was prepared by using oleic acid as oil, capryol PGMC as a surfactant and ethanol as a co-surfactant, as the garlic oil shows better solubility in these excipients which is find out by constructing pseudo-ternary phase diagram. The Km = 3 was selected for the preparation of SNEDDS of garlic oil because it shows better nanoemulsion region as compared to Km = 1 and 2. **Discussion:** The formulated SNEDDS of garlic oil was evaluated for physical characterization, thermodynamic stability, rheology study, globule size and zeta potential, dispersibility study, cloud point determination, % transmittance, drug content, FTIR study and *in vitro* drug release study. Three batches of SNEDDS of garlic oil was formulated using Km value 3 which cover maximum nanoemulsion region, containing oleic acid (solubility 57.53 ± 0.45), Capryol PGMC (solubility 59.80 ± 0.82) and ethanol (solubility 49.83 ± 0.30). Based on the compatibility study, optimum globule size (177.2 nm), minimum polydispersity (0.386), higher drug content (90.89 ± 0.68) and higher drug release (98.85%), batch F2 was optimized. **Conclusion:** The bioavailability problem can be overcome by the Self nano- emulsifying drug delivery system, which presents the more drug in solubilized form in the body as compared with other conventional drug delivery systems.

Key words: Self Nanoemulsifying Drug Delivery System, Garlic oil, Pseudo ternary phase diagram, Capryol PGMC, poorly water soluble drug.

INTRODUCTION

Garlic, botanically known as *Allium sativum* Linn. a member of Liliaceae family is one of the earliest documented example of plants employed for the treatment of diseases and maintenance of health.[1] Garlic oil is best known for its number of medicinal values such as anti-atherosclerosis, blood lipid and sugar modulation, antifungal, antimicrobial, anti-thrombolic, cardiovascular disease treatment and stimulation of immune system.[2] However, the application of garlic oil in the food industry is limited due to its volatility, strong odour, insolubility in water and low physicochemical stability.[3] To overcome these problems various methods are listed in the literature which include incorporation of hydrophilic excipients, solid dispersion, micellar solubilization, microemulsion etc. But in recent years considerable attention has been made to develop lipid based pharmaceutical preparation as it improves not only solubility but also permeability which leads to improve oral bioavailability of poorly water soluble

Satara

drugs, such a system is known as Self Nanoemulsifying Drug Delivery System (SNEDDS).[4]

Self Nanoemulsifying Drug Delivery Systems (SNEDDS) are regarded as anhydrous forms of the nanoemulsion. SNEDDS are homogenous liquid mixtures consisting of drug, natural or synthetic oil, surfactant and co-surfactant that have a rival ability of spontaneously forming fine oil-in-water (O/W) nano-emulsions of size about 200 nm or less, upon dilution with water. These preparations are thermodynamically stable and transparent or translucent system. Nano-sized dispersion of nanoemulsion was stabilized by the addition of surfactants and co-surfactants. SNEDDS are also known as nanoemulsion, miniemulsion, ultrafine emulsion or submicron emulsion. These systems were formulated mainly by using medium chain triglycerides, oils and non-ionic surfactant, which is important in oral ingestion. SNEDDS are one of the stable nanoemulsion and it provides a large interfacial area for partitioning of drug between oil and aqueous phase, thereby improves the rate of drug dissolution and increases bioavailability of the drug formulation. SNEDDS are the most preferred drug delivery system due to their stability, practicability of easy oral administration and ability to enhance drug self emulsification inside the gut.[5,6]

Thus, utilizing SNEDDS as a promising technology to overcome the problems of low bioavailability leads to develop a drug with improved solubility as well as improved physiochemical stability.[7] Hence, SNEDDS of garlic oil will control different aspects of drug efficacy such as pharmacokinetics, bioavailability, targeted delivery, non-specific toxicity and immunogenicity and will be beneficial as suitable dosage form which results in better patience compliance and improved therapeutics.[8,9]

MATERIALS AND METHODS

Garlic oil (Sanket Enterprises, Mumbai), Oleic acid (Molychem, Mumbai), Capryol PGMC (Gattefosse, France), Ethanol and Methanol (S. D. fine Chemicals, Mumbai). All other materials or chemicals used were of analytical grade.

Selection and screening of drug components

For the selection of suitable components with good solubilizing capacity for garlic oil, saturation solubility of garlic oil was examined in various oils (oleic acid, cotton seed oil, almond oil, castor oil), surfactant (Capryol PGMC, Labrafac PG, tween 20, span 80, cremophore EL) and co-surfactants (Ethanol, propylene glycol, PEG 200, glycerol). In this solubility study the excess amount of drug i.e. garlic oil was added into screw caped glass vials containing two ml of each excipients followed by sealed vials. The sealed vials were kept in sonicator for 2 h. after that the mixture was kept in water bath at 40°C for 24 h and then these vials were centrifuged at 15000 rpm for 30 min. The samples were collected and filtered using a membrane filter (0.45 micro meter). The filtrate was suitably diluted with methanol and drug concentration was obtained by using UV Visible spectrophotometer.[10]

Construction of pseudo ternary phase diagram

The pseudo ternary phase diagram was constructed without garlic oil to recognize the maximum self-emulsifying domain existence and to specify the optimal ratio of oil, surfactant and co-surfactant for the SNEDDS formulations. The pseudo ternary phase diagrams were constructed by drop wise addition of distilled water to homogeneous liquid mixture of oil, surfactant and co-surfactant, at ambient temperature by water titration method.

From result of solubility studies and screening of solubility of excipient: Oleic acid, Capryol PGMC and ethanol were selected as oil, surfactant and co-surfactant. The mixture of oil and surfactant / co-surfactant (S/CoS) i.e S_{mix} at certain weight ratio were diluted with water in drop wise addition. Surfactant and co-surfactant mixture were mixed in different weight ratio at different Km value 1, 2, 3 ratio i.e. 1:1, 2:1, 3:1 (w/w). The oil and S_{mix} were mixed at ratio of 1:9, 2:8, 3:7, 4:6, 5:5, 6:4, 7:3, 8:2, 9:1 Figure 2, 3 and 4. Slow titration with aqueous phase was done to each ratio of oil and S_{mix} and visual observation was carried out for transparency and flowability of nanoemulsion. The mixtures were examined for turbidity to transparency. Clear and isotropic mixtures were deemed to be within Nano emulsion region. On the other hand, the emulsion with coarse droplets or temporary emulsion exhibiting coalescence or creaming on terminating stirring was considered "bad". All the tests were performed in triplicate.[11,12]

Preparation of liquid SNEDDS

The phase diagram was constructed at different Km values. The Km value at which nano-emulsion region obtained was selected for further studies. Three formulations were selected from this nano- emulsion region.

Oil, surfactant and co-surfactant were accurately weighed and mixed by gentle stirring. Based on solubility, formulation amount of garlic oil (100mg) was dispersed into mixture of oil and surfactant and co-surfactant. All the components were mixed by gentle stirring on

Garlic F3	100	50	10	40

magnetic stirrer until garlic oil was completely dissolved. Mixture was sealed in glass vial and stored at room temperature for further study.[13] The composition of selected formulations showed in Table 1 and Figure 6.

Evaluation of SNEDDS[14-16]

Physical characterization

The organoleptic properties of the SNEDDS such as, color, odor and physical state were checked by visual observation.

Thermodynamic stability study

The thermodynamic stability of lipid based formulation can be adversely affected by precipitation of the drug in the excipients matrix. This can be also lead to phase separation of the excipients affecting not only formulation performance as well as visual functioning. The thermodynamic stability study was based on following three tests:

Heating and cooling cycle

Three heating/cooling cycles between 4°C and 40°C with storage at each temperature for not less than 24 h. The resultant formulations were evaluated for their thermodynamic instability like precipitation and phase separation. The formulation which qualifies this test was subjected to further study.

Centrifugation study

The prepared formulations were centrifuged using laboratory centrifuge at 5000 rpm for 30 min. The resultant formulations were then determined for any instability problem, such as phase separation, cracking or creaming. A formulation which qualifies this test subjected for further study.

Freeze thaw cycle

To determine the stability of SNEDDS freeze thawing was employed. The prepared formulations were subjected to three freeze thaw cycles, which included freezing at −4°C for 24 h followed by thawing at 40°C for 24 h. Then centrifugation was performed at 3000 rpm for 10 min. Then the tested formulations were observed for phase separation.

Rheological study

The viscosity of the prepared formulations was determined by using Brookfield viscometer which determines the consistency of nano-emulsion formulation. 1ml of each prepared formulations were diluted 10 times with distilled water and then viscosity was measured using Brookfield viscometer and assessed visually for any phase separation.

Globule size and zeta potential determination

Droplet size of SNEDDS was determined by photon correlation spectroscopy that analyses the fluctuations in light scattering due to Brownian motion of the particle, using a Zetasizer. The zeta potential of the SNEDDS should be evaluated as it may further give an idea of the colloidal stability. Both these tests were carried out by using Nanoparticle analyzer sz-100 (Horiba Scientific, Japan).

Dispersibility test (Assessment of self emulsification)

The efficiency of self- emulsification of oral nanoemulsion is determined by using a standard USP XXII dissolution apparatus II. 1ml of each formulation is added to 500 ml of water at 37±0.5°C. The stainless steel dissolution paddle rotating at 50 RPM provided gentle agitation. The emulsification time assessed visually.

Percent transmittance

The percent transmittance of the prepared formulations were measured using UV Visible double beam spectrophotometer or Single Beam Spectrophotometer using distilled water as blank at suitable wavelength. For this study 1ml of each prepared formulations were diluted to 100 ml of distilled water and observed for any turbidity and % transmittance was observed by using UV-visible spectrophotometer (Shimadzu UV 1800) against distilled water at suitable wavelength.

Cloud point determination

The prepared formulations were diluted with distilled water in the ratio 1:250, placed in water bath and its temperature was increased gradually. Cloud point was measured at the temperature at which there was a sudden appearance of cloudiness occurred.

Drug content

The total amount of drug in the formulation was analyzed by dissolving the formulation in 10 ml of

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

methanol. This solution was vortexed for 10 min in vortex mixture. The mixture was centrifuged at 15,000 rpm for 10 min. Then the supernatant was filtered through Whatman filter paper. The concentration of garlic oil was analyzed spectrophotometrically at 306 nm.

FTIR Study

The prepared formulations were analyzed by Fourier Transform infrared spectroscopy (UV Agilent Technology) to characterize the probable structural modification produced. The sample was analyzed in the region of 4000 and 400 cm^{-1} and then sample or mixture kept into sample holder for analysis.

In vitro drug release study

In vitro dissolution studies of prepared formulations were carried out. The prepared formulations were filled in hard gelatin capsule. *In vitro* drug release profile of garlic oil from SNEDDS was assessed using USP dissolution testing apparatus I (basket type) at 50 rpm with 900 ml 0.05 M NaCl of pH 1.5 as dissolution medium. Temperature was set at 37. 0± 0.5°C and sampling interval were fixed at 5, 10, 15, 20, 25, 30 min.1ml of sample withdraw at each time interval and replaced with 1ml fresh 0.05M NaCl of pH 1.5 solution. The solution was immediately filtered through whatman filter paper and the filtrate was diluted with dissolution medium up to 10ml and evaluated for the drug content using UV-Visible spectrophotometric method at 306 nm.[17]

RESULTS AND DISCUSSION

From the solubility study oleic acid was selected as oil, capryol PGMC as surfactant and ethanol as co-surfactant, as the garlic oil shows more solubility than the other components which were shown in Figure 1.

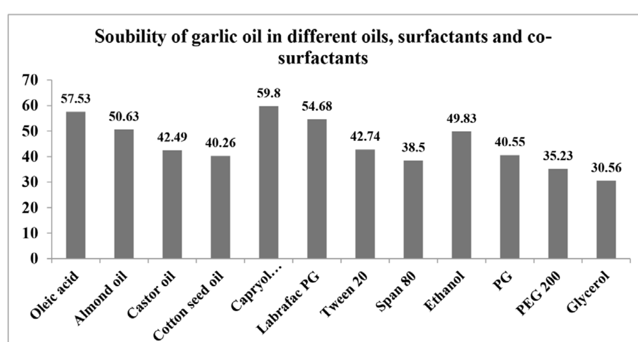

Figure 1: Solubility of garlic oil in different oils, surfactants and co- surfactants.

Figure 6: Formulated batches of SNEDDS of Garlic oil.

Construction of pseudo-ternary phase diagram

Preparation of liquid Self Nano-emulsifying Drug Delivery System

Oleic acid-Capryol PGMC-Ethanol-Water based system selected at final Pseudoternary phase diagram of various surfactants and co-surfactant weight ratio was constructed and system of highest water absorption (highest nano emulsion region) selected for formulation. The phase diagram at Km value 3 showed better nano-emulsion existence region than 1 and 2.

Three formulations were selected from phase diagram at Km value 3, named as Garlic F1, Garlic F2, Garlic F3, as shown in Figure 5. Quantitative unit compositions of selected formulation of SNEDDS were presented in Table 2.

Evaluation of prepared SNEDDS

Physical characterization

The physical characterization of formulated batches was shown in Table 3.

Table 2: Composition of selected formulations.

Batch	Drug (mg)	Smix (ml)	Oil (ml)	Water (ml)
F1	100	30	10	60
F2	100	40	10	50
F3	100	50	10	40

Table 4: Thermodynamic stability study of formulated batches.

Batch	Heating cooling cycles	Centrifugation test	Freeze thaw cycles
Garlic F1	+	+	+
Garlic F2	+	+	+
Garlic F3	+	+	+

Thermodynamic stability study

Thermodynamic stability of SNEDDS was essential to its performance, which can be affected by precipitation of the drug. In addition the formulation having poor physical stability can affects the formulation performance and it also leads to phase separation. Hence thermodynamic stability studies were performed by performing heating cooling cycle, centrifugation test and freeze thaw cycle, it was observed that formulation passed the heating cooling cycle test, hence further exposed to centrifugation test then it was taken for freeze thaw stress test. After freeze thaw stress test it was found that all three formulations showed good stability with no phase separation, creaming or cracking were showed in Table 4.

Rheological study

The rheological properties of the prepared formulations were evaluated by Brookfield viscometer. This viscosities determination confirm the system is o/w or w/o. If system has low viscosity then it is o/w and high viscosity then w/o. Viscosity of prepared batches was determined by diluting 1 ml sample of each batch with 10 ml and 100 ml of distilled water by using Brookfield viscometer. The obtained results were showed in Table 5.

Globule size and zeta potential determination

The globule size of the emulsion is a crucial factor of self nano-emulsification performance because it deter-

6757
DIRECTOR
Yashoda Technical Campus
Satara

mines the rate and extends of drug release as well as drug absorption. Also, smaller particle size of the emulsion droplets may lead to more rapid absorption and improve the bioavailability.

The globule size and zeta potential determined using Nanoparticle analyzer sz-100. The average globule size was taken into consideration. Table 6 shows the particle size, zeta potential and PDI of formulated batches of garlic oil SNEDDS diluted with water. The average particle size obtained from optimized batch Garlic F2 of SNEDDS formulation of garlic oil was found to be 177.2 nm, zeta potential -25 mv and polydispersity index was found to be 0.386 Figure 7 and 8. Zeta potential is the another property that was assessed for increased absorption of SNEDDS is the charge of oil droplets which is usually found to be negative due to the presence of free fatty acid. These results indicate that the optimal garlic oil SNEDDS formulation produced clear nano emulsion with nanometric size.

Dispersibility test (Assessment of Self Emulsification)

Emulsification time is a major parameter that helps in the determination of emulsification rate of SNEDDS. Oil is a major factor that affect relatively because when it present in high concentration, it prevent penetration of water. While hydrophilic compound such as surfactant and co-surfactant helps in dispersion and so enhance the emulsification rate. The efficiency of self- emulsification could be estimated primarily by determining the rate of oil droplets of SNEDDS formulation dispersed quickly and completely when subjected to aqueous dilution under agitation. The self- emulsification time of prepared formulation of SNEDDS were show in Table 7.

Percent transmittance

The results of % transmittance were shown in Table 8. The clarity of prepared nano emulsion was checked by transparency, measured in terms of transmittance. SNEDDS forms o/w nano emulsion since water is external phase. Formulation Garlic F2 has 97.50 % transmittance. The result indicates good clarity of emulsion Table 8.

Cloud point determination Cloud point of prepared nanoemulsion was found to be higher than 80°C, which indicate that nanoemulsion will be stable at physiological temperature without risk of phase separation. The obtained results were showed in Table 9.

Drug content The drug content of the prepared formulations was shown in Table 10.

Drug and formulation has shown no any difference in spectra indicate drug is intact in the formulation which was shown in Figure 9.

In vitro drug release

In vitro drug release study of prepared formulations of garlic oil SNEDDS was performed in 0.05 M NaCl of pH 1.5. The % drug release was shown in Table 11 and Figure 10.

CONCLUSION

In this study, liquid SNEDDS was formulated by using capryol PGMC as surfactant. From this study, it was concluded that the prepared liquid SNEDDS was thermo dynamically stable with good self-emulsification efficiency, improved dissolution rate and having globule size in the nanometric range which may be physiologically stable. The SNEDDS with relatively high drug content was prepared which self-emulsified easily with mean emulsion droplet size of 177.2 nm. Thermodynamic stability study and cloud point study confirmed that the SNEDDS had no dilution effect and was stable without any precipitation of drug and without any change in emulsion droplet size.

ACKNOWLEDGEMENT

The authors are thankful to Ashokrao Mane College of Pharmacy management for providing facility to carry out research work, also thankful to Sanket Enterprises, Mumbai for providing Garlic Oil and Gatteffosse Mumbai for providing Capryol PGMC as gift sample.

CONFLICT OF INTEREST

The authors declare no conflict of interest.

PICTORIAL ABSTRACT

Problems associate with Garlic oil:
Volatility, Strong odour, Insolubility in water, Low physicochemical stability

SUMMARY

In this present work, liquid SNEDDS of garlic oil was formulated by using capryol PGMC as surfactant. From this study, it was observed that the prepared liquid SNEDDS of garlic oil was thermodynamically stable with good self-emulsification efficiency, improved dissolution rate and having globule size in the nanometric range which may be physiologically stable. The garlic oil shows better solubility in oleic acid (oil), capryol PGMC (surfactant) and ethanol (co-surfactant) which was find out by constructing pseudo-ternary phase diagram. The Km=3 was selected for the preparation of SNEDDS of garlic oil because it shows better nanoemulsion region as compared to Km=1 and 2. The SNEDDS with relatively high drug content was prepared with mean emulsion droplet size of 177.2 nm. Thermodynamic stability study and cloud point study confirmed that the SNEDDS had no dilution effect and was stable without any precipitation of drug and without any change in emulsion droplet size.

Abstract

Most of the marketed cosmetics when applied on the skin cause dryness of skin after its long term use which results less life of skin problems of acne and redness. Solution for this problem is use of scrub gel once or twice in week which consist all herbal ingredients which increases cleansing, softening, moisturizing, fairness of skin. In the present work we have formulated the herbal facial scrub by using a different herbal powders and it was evaluated by using the parameters like smoothness, appearance, spreadibility, irritation etc.

Abstract

Polyherbal soap was prepared by using sandal wood and Orange peel extract and evaluated by using various evaluation parameters such as organoleptic characteristics, pH, foam height and retention, skin irritation and high temperature stability. Prepared Polyherbal soap having good appearance better cleansing and foaming effect and doesn't have any side effects.

Antimycobacterial activity

Abstract Fifty one hydrazone derivatives of eugenol were designed and docked with 2NSD and 2X22 (enzymes of H37Rv strain) using Schrodinger v7.4. The selective ten hydrazone derivatives (4, 5, 11, 18, 30, 34, 35, 37, 42, and 45) of eugenol were synthesized via esterification, hydrazination and treatment with different aldehydes. Synthesized compounds were characterized by IR, ^{1}H NMR, and LCMS data. The compounds were evaluated for their antitubercular potential against H37Rv using microplate alamar blue assay (MABA). The study revealed that all synthesized compounds were significantly active at concentration 50 and 100 μg/ml, whereas compound 11 exhibited activity at 25 μg/ml. Present study showed that antitubercular activity of novel hydrazone derivatives of eugenol is strongly connected with the position of the substituent on aromatic aldehyde or ketones.

1. Introduction

Current decade noticed tuberculosis as the most common infectious disease in the world that being a leading cause of mortality. Regardless of availability of tuberculosis treatment, yet every year 9 million new cases are reported in those 1.5 million are fatal cases (Pitucha et al., 2019). Tuberculosis (TB) is caused by mycobacterium of the "tuberculosis complex", including primarily *Mycobacterium tuberculosis*, *Mycobacterium bovis* and *Mycobacterium africanum* (Sensi and Grass, 1996). Drug discovery and development are complicated, time intense and costly method (Pieczonka et al., 2013). It becomes more expensive when safety, efficacy and other issues are raised. In silicon approach of drug design plays a significant role in all stages of drug development from the initial lead design to final stage of clinical aspect of drug (Abdel-Wahab et al., 2011). Reports suggest eugenol and hydrazones to possess significant anti-tubercular potential (de Almeida et al., 2019; More et al., 2018; Krátký et al., 2017). The chemistry of hydrazones always attract the investigators, as incorporation of these moieties in medicinal compounds due to their biological potential. The hydrazones are known to exhibit wide

variety of biological activities. They are used as antibacterial agent, anti-tubercular agent, analgesic, anti-inflammatory agent, antiviral agent, antifungal agent, muscle relaxants and antihistamines etc (Yatcheria et al., 2015; Saidugari et al., 2017; Raja et al., 2010; Zheng et al., 2009). In hydrazone, the nitrogen is attached to hydrogen and these hydrazones are stable enough for isolation (March, 1992). However, in some cases, especially with simple alkyl group, they rapidly decompose or polymerizes unless there is at least one aryl group on nitrogen or the carbon (Fuloria et al., 2008). When there is an aryl group the compound are quite stable and these compound are called as Schiff bases. The Schiff reaction is straight forward and proceeds in high yield (Fuloria et al., 2008). Enticed by research evidences, it was thought worthwhile to synthesize some novel hydrazone derivatives of eugenol. We have made an attempt to convert aryloxy moiety into some novel hydrazones via hydrazide and ester intermediates to explore its biological potential. These hydrazones were subjected to molecular docking, synthesis, characterization and antimycobacterial screenings against Mycobacterium tuberculosis.

2. Materials and methods

2.1. General

All chemicals, reagents and solvents were procured from Sigma-Aldrich and Merck Pvt Ltd. and were used without further purification. The reactions were carried out in oven-dried glassware (120 °C) under atmospheric condition. Chemicals and related solvents were procured from Merck Chemicals. From fifty-one in silico docked compounds, the selective ten compounds were subjected to synthesis. The reactions and purity of compounds were monitored by thin layer chromatography (TLC) over percolated plates coated with 0.2 mm Merck 60 F254 silica gel using butanol, acetic acid and methanol (4:3:1, v/v) eluent mixture, and were visualized by UV irradiation (254 nm). The synthesized compounds were purified using column chromatography. The melting points were determined using B-540 melting point apparatus using open capillaries and are uncorrected. The infrared spectra were recorded on a Shimadzu, MIRacle-10, IR Affinity-1 in the range of 400–4000 cm^{-1}. The ^1H NMR spectra were recorded in $CDCl_3$ using Agilent VNMRS 400 instrument at 300 MHz with chemical shift 0–10. The chemical shifts, δ are reported in ppm from 0 to 10 using tetramethylsilane (TMS) as internal standard. The mass spectra were performed using LCMS6103 at m/z values: 0–500.

2.2. Molecular docking

Fifty one compounds (Table 1) were docked in Small-Molecule Drug Discovery Suite of Schrodinger. All compounds were targeted on two enzymes such as 2NSD and 2X22 involved in tuberculosis activity. InhA, the enoyl-ACP reductase in Mycobacterium tuberculosis is an attractive target for the development of novel drugs against tuberculosis. The generated lower energy conformers of all ligands were docked into generated grid of active site of enzymes by XP precision of docking inside Glide-v7.4 (Joshi et al., 2016; Rohane and Makwana, 2019).

2.3. Synthesis of ethyl aryloxy acetate **2**

A mixture of compound 1 (eugenol: 0.1 mol), ethyl chloro acetate (0.1 mol) and anhydrous potassium carbonate (0.15 mol) in dried acetone was refluxed for 12 h. Resultant mixture was distilled off and poured on to ice-cold water and stirred. Residue was extracted with ether and the extract was dried over anhydrous sodium sulphate and was purified under reduced pressure to yield compound 2.

2.4. Synthesis of ethylaryloxyacetyl hydrazine **3**

A mixture of compound 2 (0.05 mol) and hydrazine hydrate (0.075 mol) in ethanol was refluxed for 4 h and after distilling off the solvent the residue was recrystallized from methanol to yield compound 3.

2.5. Synthesis of hydrazones **4, 5, 11, 18, 30, 34, 35, 37, 42,** and **45**

A mixture of compound 3 (0.01 mol) and 2, 4-dihydroxy benzaldehyde (0.01 mol) was refluxed for 2 h using acetic acid. The crystals formed were washed with ice-cold water, dried and recrystallized from methanol to yield compound 4. Following the same procedure using respective aldehydes / ketones, other compounds 5, 11, 18, 30, 34, 35, 37, 42, and 45 were synthesized Scheme 1.

2.6. Anti-tubercular activity

The synthesized compounds (4, 5, 11, 18, 30, 34, 35, 37, 42, and 45) were evaluated for their anti-tubercular potential against standard strain of H37Rv. The method used was microplate Alamar Blue assay (MABA). The final drug concentrations tested were 100–0.2 μg/ml. Plates were covered and sealed with parafilm and incubated at 37 °C for five days. After addition of Alamar Blue reagent and incubating for 24 h, the results were observed. A blue color in the well was interpreted as no bacterial growth, and pink color was scored as growth.

Being a non-toxic method, it has several advantages such as thermal stability of the reagent, and good correlation with BACTEC radiometric method.

3. Result and discussion

3.1. Molecular docking

The Insilco study of all fifty-one compounds was performed using Small-Molecule Drug Discovery Suite of Schrödinger. The compound 11exhibited good docking score and predicted interaction with enzymes. The docking result of novel hydrazone revealed that the binding energies were in the range of −6.097 kcal/mol to −10.393 kcal/mol, with the minimum binding energy of −10.393 kcal/mol (Table 2). The molecules were tested for structure analysis by the visualization tool. The entire compounds protein-ligand complex showed H - bond with the active site residue TYR 158 and PHE 149of 2NSD (Fig. 1) and GLY96 and TYR 158 of X22 (Fig. 2).

3.2. Synthesis and characterization of synthesized compounds

The ten hydrazone compounds 4, 5, 11, 18, 30, 34, 35, 37, 42 and 45 were selected for synthesis based on their in-silico docking results. The derivatives were synthesized by condensation of arylhydrazide with various aromatic aldehydes or ketones using ethanol. Physical data of all synthesized compounds are given in Table 3 and characterization data mentioned in supplementary file. In the IR spectra, all hydrazone derivatives displayed characteristic band from 1700 to 1650 cm^{-1} attributed to C=O stretching vibration. The N—H stretching vibration of the compounds exhibited a band at near 3150 cm^{-1}. The stretching bands for C=C and C=N groups were observed at 1610–1490 cm^{-1}. In general, the IR stretching frequencies for –OH groups varied for the compounds 4, 18, 34 and 42 in the region 3200–3650 cm^{-1}. In the ^{1}H NMR spectra of all the compounds,

3.3. Antitubercular activity

The compounds 4, 5, 11, 18, 30, 34, 35, 37, 42 and 45 were evaluated for *in vitro* antimycobacterial activity against *M. tuberculosis* H37Rv by microplate alamar blue assay (MABA) method, using isoniazid as standard. The results expressed in minimum inhibitory concentration (MIC) are given in Table 4 and the colour change observed during assay method is shown in Fig. 3. The obtained results indicate the biological potential and varying activity depending on the type of substituent on

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR

Satara

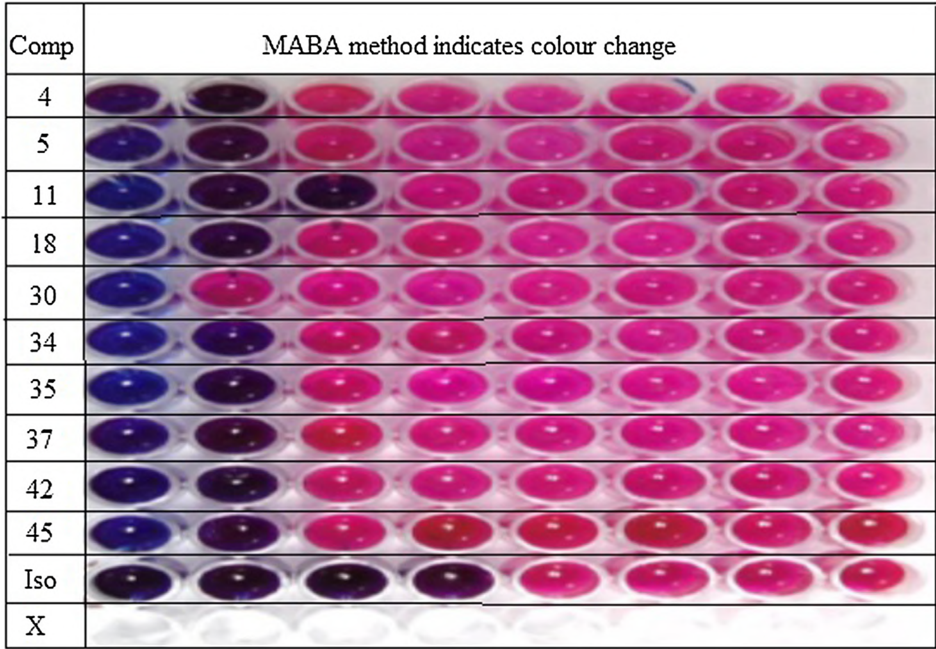

Fig. 3 Assessment of Microplate Alamar blue assay result.

hydrazide nucleus. The results of anti-tubercular activity revealed all newer hydrazones possess inhibitory potential against *Mycobacterium tuberculosis*. Whereas compound 11 possess highest sensitivity against *M. tuberculosis* H37Rv at 25 μg/ml level. The antibacterial activity is strongly connected with the position of the electronegative substituent on phenyl ring of aldehydes in relation to the hydrazone skeleton (Fuloria et al., 2017).

4. Conclusion

The molecular docking studies investigating hydrazone derivatives using the enzyme 2NSD and 2X22 as their potential biological target indicate that the amino, azide, hydroxyl and phenyl nucleus of hydrazone derivatives spacer play an important role in interactions with the active site such as TYR 158, ILE 215, GLU 219, PHE 97 and PHE 149 as the most active amino acid residues. Present study establishes the synthesis of newer hydrazone derivatives 4, 5, 11, 18, 30, 34, 35, 37, 42 and 45 by Schiff's reaction of aryloxy hydrazide with appropriate aldehyde or ketone. The structures of synthesized compounds were confirmed by spectroscopic methods. In the prepared hydrazone all compounds showed significant anti-tubercular action where as compound 11, exhibited highest anti-tubercular activity.

ABSTRACT

They because it has become part of our society and fashion, cosmetics areextremely in demand since historical times till the day. Lipsticks are most commonly used to enhance lip appeal, and they also aid greatly in preserving health and happiness. For this intention and objective, an attempt was made to frame herbal lipsticks using colored natural, and the lipsticks were tested on their sensory examination, such as spreading, stiffness, shine and gloss, in order to achieve a good product. Such lipstick preparations contain natural ingredients such as carnauba wax, white bees wax oil of peppermint, oil of castor, oil of almond. Because of various adverse effects of the available synthetic preparation, the present work was designed to formulate a herbal lipstick with minimal to no side effects that will be used extensively by our society's women with great compensation and satisfaction.

KEYWORDS: Red Barrie, Blue Barrie, Herbal Lipstick, Cosmetics.

1. INTRODUCTION

Cosmetics include skin care creams, lotions, powders, eye and facial make-up, permanent waves, colored contact lenses, hair colors, hair sprays, and gels, deodorants, infant products, bath oils, bubble baths, bath salts, butters, and many other types of cosmetics in both developing and developed countries.[1,2]

The world herbal is a symbol of safety in contrast to the synthetic one which has adverse effects on human health. Herbal preparations via ; herbal tablets , herbal tonics, herbal paste, herbal shampoo, herbal tonic, herbal paste, herbal sindhur, herbal contraceptives and herbal lipstick has become popular among the consumer herbal medicine represent the fastest

growing segment to heal the various aliment possibly, the herbal users desire to assume control over health.[3,4]

The use of the drug has increased in the present days and a lot of improvements occur in the choice of stain texture colors, lipstick luster.[5] It can be learned from the evidence that lipstick is being sold in hundreds of shades of colors to satisfy women's demand.[6] Now it's time to stick to the use of herbal products and embrace a more natural way of life in the whole world for days.[6]

Ideal characteristics of good lipstick

- It should be non- irritant.
- It should have required plasticity.
- It should nontoxic.
- That should be physically and chemically stable.
- It is not expected to dry up on board.
- It should be heavily particulate free.
- After application it can retain lip color for longer periods.
- This should offer sweating-free shiny and smooth appearance.
- It should look, smell and feel good.

It should not fuse or harden within acceptable climatic temperature variation.[7]

2. Noxious lipstick issues

while lipstick has a colorful background and a specific market, it also suffers from some dangerous disadvantage. Recent research has found that the lipstick contains traces of lead and other heavy metals such as antimony, arsenic, cadmium that cause serious health problems and can be carcinogenic or even fatal in extreme form as it is based on human ingestion.[9] Such lip care products cause some allergic reactions, the most severe being allergic touch cheilitis of the vermilion margin of the lip often spreading to the adjacent perioral area that may be acute or chronic.[10]

2.1 Lead traces

A recent federal study showed that 400 shades of common lipstick contained trace amounts of lead which intensified a continuing dispute between regulators and consumer activists about how much lead is safe in cosmetics.[11] According to tests by the Food and Drug Administration, five lipsticks manufactured by L'Oreal and Maybelline, operated by L'Oreal

Yashoda Technical Campus Satara DIRECTOR Yashoda Technical Campus Satara

USA, rated among the top 10 most contaminated of cosmetics.[10] Two Cover Girl and two NARS lipsticks have landed in the top 10, much as Stargazer did one. In October 2007, a study by the US consumer group Campaign for Healthy Cosmetics found that 60 per cent of the lipsticks tested contained trace amounts of lead, particularly in red lipsticks. Lead rates ranged from 0.03 parts to 0.65 parts per million. One third of lead-containing lipsticks reached the mark of 0.1ppm limit set by the U.S food and drug administration for lead in candy.[12]

2.2 Description of fruit

Red barrie: (Rubus idaeus)[12,13,14]

Botanical name	Red raspberry, Rubus Idaeus
Taxonomy	The raspberry, bramble fruit of genus rubus belong to family Rosaceae.
Geographical area	The wild beery gathering remains a popular activity Europe and north American
Chemical constituent	Anthocyanin, flavonoids, stilbenoids, phenolic acid, tannin and lignans Ellagic acid, cyanidins, pelargonidins Folate, omega 3 fatty acid.
Medicinal uses	Antioxidant and anti- inflammatory. Obesity and Blood sugar benefits. Anti-cancer

- **Blue Barrie: (Rubus ulmifolius)[15,16]**

Taxonomy	The blueberry fruit of genus belong to vaccinium and cyanococcus belong to family Ericaceae. n subfamily vaccinoideae genus vaccinium
Geographical area	· North America and Europe region · Atlantic Canada · Northeastern united states
Chemical constituent	· Anthocyanins, anthocyanidine (phenolic aglycone) · Chlorogenic acid, flavonoids, alphalinolenic acid and vitamins.
Medicinal uses	· Maintaining healthy bones · Skin health · Lowering blood pressure · Managing diabetes

3. MATERIAL AND METHOD

3.1 Material

Sr.no	Material	Manufactured by
1	Red Raspberry (Red Barriers)	Magsa Moulde, Food Market
2	Rubus Ulmifolius (Blue Berry)	Magsa Moulde, Food Market
3	Bees Wax	Vedant Lab
4	Carnuba wax	Vedant Lab

5	Lanolin	Vedant Lab
6	Mentha Piperita (Peppermint Oil)	Dhanvantari Ayurveda
7	Prunus amygdalus Oil (Almond Oil)	Dhanvantari ayurved
8	Orange Essence	Dhanvantari ayurved
9	Vanilla Essence	Dhanvantari ayurved

3. 2 Method

Herbal lipstick formulation requires the basic manufacturing process such as,[17]

- **Pigment premilling**

The first step involved in the formulation of herbal lipstick is pigment premilling where the agglomerates in the powder are broken down to give the lipstick a homogeneous smoothness and even colour.

- **Melting and mixing**

The next step involved is the melting and mixing stage, since waxes are solid at room temperature and can not be combined with other ingredients to make the waxes melted simple to make this process. Typically it can be combined with oil, and the pigment and other additives are added and blended to form a homogeneous substance to the melted foundation.

- **Molding**

Molding is the actual phase in which the molten lipstick is poured into metal or plastic mold, the mixture is poured when it is hot so it is helpful to harden and then removed with a slight pressure from the mole.

- **Flaming**

Flaming is the last stage in which the lipstick passes through the flame, is usually held and twisted in the flame for up to a second and then removed to prevent melting and losing shape to achieve a shiny finish and then put in the bottle. Different formulations are made from Test 1 to Test 5 to find the superior lipstick with colorant and oil as variable parameter.

Basic ingredient required

Sr. no.	Ingredients	% (w/w)
1	Bees wax	10
2	Caruba wax	10
3	Lanolin	15
4	Mentha Piperita (Peppermint Oil)	65
5	Prunus amygdalus Oil (Almond Oil)	65
6	Orange Essence	Adequate
7	Vanila Essence	Adequate

A cosmetic lip care should have the following criteria from a customer perspective: attractive color Homogeneous color when applied

- Attractive colour
- Homogeneous colour when applied
- Pleasant smell and taste
- Easy to apply
- No staining or bleeding into fine line surrounding the lips
- Long lasting effect

3.3. Evaluations test

The quality control parameter used in efficient are

- Melting point
- PH
- Surface anomalies
- Solubility test
- Skin irritation test
- Color
- Microbiological test

1. Melting point

Apparatus: Flat Bottom Tube, Thermometer

Procedure: Place the lipstick in a flat bottom tube with protruded salve. Fix the thermometer through a cork, so that the thermometer bulb just touches the salve of the lipstick. Place this arrangement into a 1-liter beaker filled with water over the upper tip of the lipstick salve to a point one centimetre above. Place this arrangement into a 1-liter beaker filled with water over the upper tip of the lipstick salve to a point one centimetre above. Warm the water gradually while stirring so that temperature increases at a rate of no more than 2 ° C per minute. As the temperature increases to about 45 ° C, increase the temperature to 1 ° C per minute. Keep the lipstick salve continuously. Report when the temperature is in when the salve begins to bend and lose form.[18]

2. PH test

The pH of herbal lipstick formulated was determined using pH paper[19]

3. Surface anomalies

This is being examined to identify any surface defects, such as surface crystal formation, mold contamination, fungi etc.[20]

4. Solubility test

The formulated herbal lipstick was dissolved to assess the solubility in various solvents.[21]

5. Skin irritation test

The drug is spread over the skin for 10 min.[22]

4. RESULT AND OBSERVATION

There has been enormous increase in women's use of cosmetics over the last few decades. The hazards caused by these chemicals, however, have recently come to the forefront. The goal of the present research formulating and evaluating herbal lipsticks was to formulate a lipstick using herbal ingredients with the hope of minimizing the side effects caused by the synthetic ones available. Therefore, from the present investigation it has been concluded that this formulated herbal lipstick has a better choice for women with limited side effects although a thorough clinical trial can be performed for better efficacy to access the formulation.

- **Melting point**

The melting point of the formulated herbal lipsticks was evaluated and the result indicates that formulation 6 has highest melting point compared to other formulations.

- **PH**

The pH of the formulated herbal lipstick was evaluated as quality control test and as a result it was found that four formulations have PH range of 6.

- **Microbiological test**

Any product will be in jeopardy by the growth of micro-organism hence it is essential to determine the number of microorganism that has grown on the product through microbiological test. This quality control test has been done on all six formulations and it has been found that formulation 6 is less susceptible to the growth of microorganism.

5. CONCLUSION

Study concluded that herbal lipstick can be successfully formulated using different natural ingredients such as white bees wax, butter , peppermint oil, almond oil, Vanilla & rose essence, blue berry extract , red berry extract powder, will be better option for synthetic colouring agents which may arise different side effects. Consumers can take safe and effective advantage of this herbal lipstick after thorough clinical trials.

ABSTRACT: The present study was undertaken to investigate the effect of cyclodextrin (CD) complexation in presence of hydrophilic polymer on physicochemical properties as well as anti- inflammatory activity of quercetin (QUN). The initial phase solubility studies were carried out in presence and absence of hydrophilic polymers (hydroxypropylmethylcellulose, polyvinylpyrrolidone K30 and poloxamer 188) to study their effect on the stability and complexation efficiency of CDs. The binary (QUN-βCD and QUN-HPβCD) and multicomponent (QUN-βCD-POLO and QUN-HPβCD-POLO) inclusion complexes of QUN prepared using lyophilization technique. The complexes were subjected to DSC, ATR-FTIR, XRPD and SEM analysis, and evaluated for drug content and saturation solubility. The phase solubility studies revealed the formation of QUN-βCD and QUN-HPβCD complexes with 1:1 stoichiometry. The incorporation of POLO increased the stability as well as complexation efficiency of CDs. FTIR and DSC analysis indicated hydrogen bonding interaction POLO with QUN and CDs. XRD and SEM analysis revealed greater amorphization in case of multicomponent inclusion complexes. All complexes showed uniform drug content. QUN-HPβCD-POLO exhibited maximum solubility than the physical mixtures and other complexes. The pure QUN and QUN-HPβCD-POLO were tested for in *vivo* anti-inflammatory activity by Carrageenan induced rat paw edema method. QUN-HPβCD-POLO exhibited significant increase in anti-inflammatory activity as compared to pure QUN.

KEYWORDS: Quercetin; β-cyclodextrin; hydroxypropyl-β-cyclodextrin; lyophilization; ternary complex.

1. INTRODUCTION

Quercetin (QUN) is a bioflavonoid (3,5,7,3′,4′-pentahydroxyflavone) widely distributed in many plants (see Figure 1). It is also a frequent component of major dietary constituents such as onions, apples, red wine and green tea. Flavonoids, intensely coloured polyphenolic phytochemicals, exhibit various biological activities. Nowadays research is being focused on the antioxidant, antitumour, antiinflammatory and antibacterial activity of flavonoids. In literature wide range of biological properties of QUN are reported which are often related to its antioxidant activity. Besides, it is also known for its anti-inflammatory, antihypertensive, vasodilator effects, antiobesity, antihypercholesterolemic and antiatherosclerotic activities [1–4]. QUN shows a strong inhibitory effect on the growth of several human and animal cancer cell lines and enhances the antiproliferative effect of cisplatin both *in vitro* and *in vivo*. However, the oral bioavailability of QUN is found to be less than 17% in rats and approximately 1% in humans which may be due to its low aqueous solubility [5–7].

From past few years, technique of cyclodextrin inclusion complexation is being widely used to improve the physicochemical properties of drugs such as solubility, chemical stability and bioavailability [5,8]. Cyclodextrins (CDs) are cyclic oligosaccharides consisting (α-1, 4)-linked α-D-glucopyranose units containing a relatively hydrophobic central cavity and hydrophilic outer surface [9]. In an aqueous environment, cyclodextrins form inclusion complexes with many lipophilic drug molecules through a process in which water molecules located inside the central cavity are replaced by either the whole drug molecule or more

frequently, by some lipophilic structure of the molecule. The natural cyclodextrins, in particular β-cyclodextrin (βCD), have limited aqueous solubility and their complex formation with

Figure 1. Chemical structure of QUN.

lipophilic compounds frequently results in precipitation of solid cyclodextrin complexes [10]. The application of βCD in the pharmaceutical formulations is limited owing to its low aqueous solubility [5].

2-hydroxypropyl-β-cyclodextrin (HPβCD); a hydroxyalkyl β-bcyclodextrin derivative has been successfully employed in pharmaceutical formulations due to its amorphous nature and enhanced water solubility than βCD [11]. However, the amount of HPβCD to be used in the pharmaceutical formulations is limited due to its toxicity [12]. The problems associated with βCD and HPβCD can be overcome by addition of small amounts of auxiliary substances such as hydrophilic polymers [13], hydroxyl acids [14] and/or amino acids [8] to the complexation media. This results in the formation of multicomponent inclusion complexes of CDs, where the auxiliary substances improve the complexation efficiency of CDs [11].

There are some reports where inclusion complexes of QUN with βCD and HPβCD have been prepared to enhance its solubility using freeze drying [5] and spray drying techniques [1]. Besides, the effect of complexation of QUN with three kinds of CDs in solution state on the antioxidant activity of QUN has been studied by Jullian and coworkers [3]. The complexes of QUN with βCD, HPβCD and sulfobutyl-βCD in solution state were studied in order to investigate the effect of complexation on chemical stability and water solubility of QUN [2]. To our knowledge, no reports related to the effect of multicomponent inclusion complexes of QUN with CDs and hydrophilic polymers on its solubility and anti-inflammatory activity are available.

The aim of this study was to prepare freeze dried multicomponent (ternary) inclusion complexes of QUN with βCD and HPβCD in presence of a suitable hydrophilic polymer in order to minimize the amount of CDs, increase the stability of the formed inclusion complexes and enhance the solubility of QUN so as to maximize its anti-inflammatory activity. Phase solubility studies were performed to study the stoichiometry between QUN and CDs, and to select the hydrophilic polymer that increases the stability of the formed complexes and improves the complexation efficiency of CDs. The prepared complexes were characterized by attenuated total reflectance-fourier transform infrared spectroscopy (ATR-FTIR), differential scanning calorimetry (DSC), scanning electron microscopy (SEM) and X-ray powder diffractometry (XRPD). The complexes were evaluated for saturation solubility and drug content. The in *vivo* anti-inflammatory activity of the complex exhibiting high solubility was evaluated using Carrageenan induced rat paw edema method.

2. RESULTS AND DISCUSSION

2.1. Phase solubility studies and interaction of QUN with CDs

The phase solubility diagram of QUN in aqueous solutions of βCD and HPβCD in the presence or absence of hydrophilic polymers (HPMC, PVP and POLO) are shown in Figure 2 (a and b). These diagrams exhibited a linear relationship between the amount of solubilized QUN and concentration of solution of CDs (A_L-type of curves) which signifies formation of water soluble complexes [15]. Table 1 shows the values of slope, stability constant (Kc) and complexation efficiency of the systems considered under phase solubility studies. The slope of phase solubility curves for all the systems was found to be less than one indicating 1:1 stoichiometry between QUN and CDs [16]. The presence of hydrophilic polymer caused increase in the stability of the formed complexes along with enhancement in the complexation efficiency of the CDs. This can be attributed to the molecular interactions in between QUN, CDs and hydrophilic polymers such as hydrogen bonding, formation of hydrophobic bonds and van der Waals interaction [17–19].

QUN/HPβCD/POLO (0.5%w/w)	0.0634	3193.08±16.81	0.0677	$4.13×10^{-5*}$

$K_{c,1:1}$: stability constant; S_o: intrinsic solubility; QUN: quercetin; βCD: β-cyclodextrin; HPβCD: hydroxypropyl-β-cyclodextrin; HPMC: hydroxypropyl-methylcellulose; PVP: polyvinylpyrrolidone K30; POLO: poloxamer 188. The values of slope C.E. and So are expressed as mean (n=3) whereas value of $K_{c,\ 1:1}$ is expressed as mean ± S.D. (n=3). * indicates solubility of QUN in presence of respective hydrophilic polymers.

Table 2 represents the Gibbs free energy change ($G_{tr}°$) in the systems with increase in the concentration of CDs. A decrease in the $G_{tr}°$ values with respect to increase in the CD concentration indicated the spontaneous nature of QUN solubilization suggesting that the reaction became more favorable with the increase in the concentration of CDs. The negative $G_{tr}°$values indicated the exothermic nature of the complexation process [20]. The system comprised of QUN, HPβCD and POLO showed maximum stability, high complexation efficiency and lowest value of $G_{tr}°$. This may be due to high solubility of HPβCD than βCD and ability of POLO to enhance the solubilizing efficiency of HPβCD by interacting with the functional groups present on the exterior of the HPβCD and QUN [21]. Due to its amphiphilic nature, POLO can also improve the solubility of the free uncomplexed drug [22]. As POLO was found to be more efficient ternary component amongst the selected polymers, it was used for the preparation of the freeze dried multicomponent inclusion complexes of QUN.

CDs: cyclodextrins; QUN: quercetin; βCD: β-cyclodextrin; HPβCD: hydroxypropyl-β-cyclodextrin; HPMC: hydroxypropylmethylcellulose; PVP: polyvinylpyrrolidone K30; POLO: poloxamer 188.

2.2. Characterization of the inclusion complexes

2.2.1. DSC analysis

DSC can be used to investigate the interaction between host and guest molecules. When guest molecules are included in CD cavity, their melting points usually shift to a different temperature or disappear [17]. DSC patterns of QUN and all complexes are shown in Figure 3. The thermogram of QUN showed a characteristic endothermic peak at 319.10^{0}C close to its melting point 316.0 indicating presence of crystalline phase. The broad endothermic peak at 126.59^{o}C (T_{onset} = 99.94^{0}C) represents removal of water of crystallization as QUN is a dihydrate molecule [23]. The DSC thermogram of βCD displayed a broad endotherm at 99.95^{o}C, indicating a loss of water due to dehydration process. A melting endotherm was observed at 335.32^{o}C. The thermal curve of pure HPβCD is characterized by a broad endothermic peak at 75.48 ^{o}C, indicating a loss of water due to dehydration process [24].

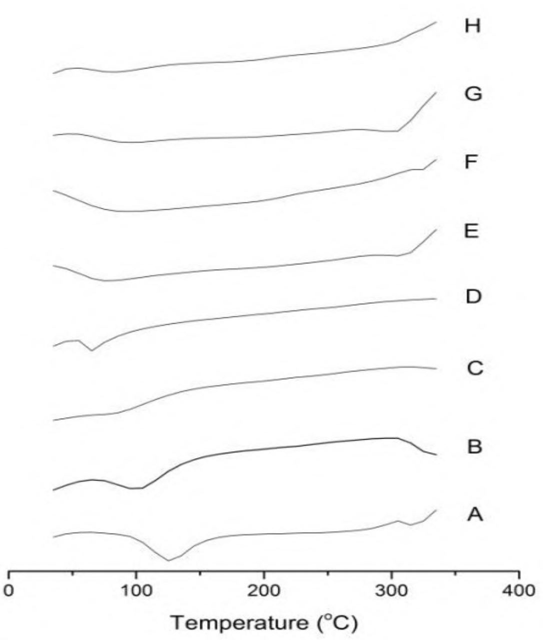

Figure 3. DSC thermograms of QUN (A), βCD (B), HPβCD (C), POLO (D), QUN-βCD (E) and QUN-HPβCD (F) binary complexes, QUN-βCD-POLO (G) and QUN-HPβCD-POLO (H) ternary complexes.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

It showed melting endotherm at 366.62°C corresponding to its melting point. The DSC thermogram of POLO showed a sharp endothermic peak at 60.28°C indicating its crystalline nature. In the thermogram of QUN-βCD binary complex, the melting endotherm of QUN was found to be diffused at 307.19°C, while the thermogram of QUN-HPβCD binary complex showed a small diffused endothermic peak at 322.78°C. In case of QUN-βCD-POLO ternary complex, the characteristic endothermic peak of QUN was diffused and shifted to 299.52°C indicating formation of inclusion complex [25]. The thermogram of QUN-HPβCD-POLO ternary complex showed absence of the endothermic peak indicating strong physical interaction between drug and HPβCD in presence of POLO [26].

2.2.2. ATR-FTIR analysis

The probable interaction between QUN and CDs in presence and absence of POLO was studied by ATR-FTIR. The IR spectra recorded for QUN, βCD, HPβCD, POLO and all complexes are shown in Figure 4.

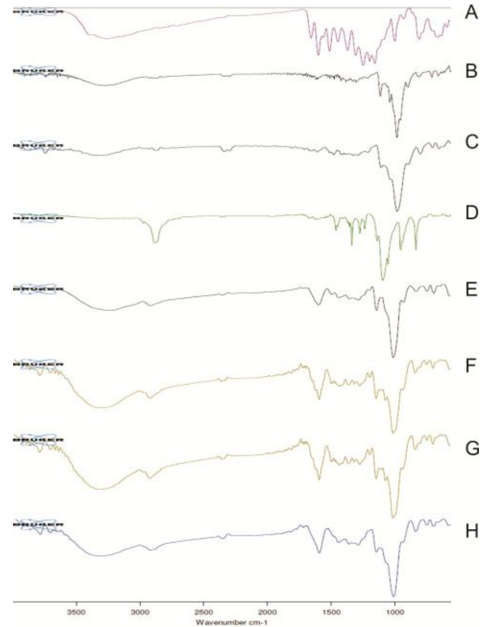

Figure 4. ATR-FTIR spectra of QUN (A), βCD (B), HPβCD (C), POLO (D), QUN-βCD (E) and QUN-HPβCD (F) binary complexes, QUN-βCD-POLO (G) and QUN-HPβCD-POLO (H) ternary complexes.

The principle absorption peaks of QUN were observed at 3390.44 cm^{-1} (O-H stretching vibration of phenol), 3259.7 cm^{-1}, 1660.66 cm^{-1} (C=O aryl ketonic stretch /aromatic ketonic carbonyl stretching), 2841.66 cm^{-1} (C-H stretching), 1603.14 cm^{-1} (C-C aromatic ring stretch), 1374.5 33 cm^{-1} (O-H bending of phenols), 1252.33 cm^{-1} (C-O stretch of aryl ether), 1161.75 cm^{-1} (C-CO-C stretch and bending in ketone) and 812.39 cm^{-1} (C-H bending of aromatic hydrocarbon) [27]. The peaks of βCD were recorded at 3276.49 cm^{-1} (O-H stretch), 1152.61 cm^{-1}, 1078.03 cm^{-1}, 1023.99 cm^{-1} (C- O- C stretch), 997.86 cm^{-1} and 937.10 cm^{-1} whereas absorption peaks of HPβCD were observed at 3737.23 cm^{-1}, 3348.45 cm^{-1} (O-H stretch), 2929.2 cm^{-1} (C- H stretch), 1026.41 cm^{-1} (C-O-C stretch). IR spectrum of POLO shows distinct peaks at 2878.80 cm^{-1} (C-H stretching aliphatic), 1446.23 cm^{-1}, 1341.71 cm^{-1} (in plane O-H bending), 1279.23, 1241.06 and 1100.17 cm^{-1} (C-O stretch).

Alterations in the characteristic bands of QUN and CDs were noted in case of binary and ternary complexes. The peaks in formulations were observed to be either shifted to different wavelengths or smoothened or appeared with decreased intensity. The absence of new peaks indicated non covalent interaction in inclusion complexes. In case of QUN-βCD complex, the peaks of QUN at 3259.70 cm^{-1}, 2841.66 cm^{-1} and 1603.14 cm^{-1}, were shifted to 3240.24 cm^{-1}, 2918.64 $cm^{-1}$and 1599.90 cm^{-1} respectively while other peaks had also shifted and appeared with reduced intensity or disappeared. Broad peak of βCD at 3276.49 cm^{-1} disappeared, while peak at 1023.99 cm^{-1} was shifted to 1018.07 cm^{-1}.

In spectrum of QUN-HPβCD complex, the principle peaks of QUN at 3259.7 cm^{-1} and 2841.66 cm^{-1} shifted to 3299.47 cm^{-1} and 2922.95 cm^{-1} while other peaks were either shifted or appeared with decreased intensity. The prominent peak of HPβCD at 1026.41 cm^{-1} was shifted to 1004.11 cm^{-1}. The disappearance of major peaks of QUN in the spectra of binary complexes clearly indicates the formation of inclusion complex.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

The spectrum of QUN-βCD-POLO ternary complex showed shifting of QUN peaks from 3259.7 cm^{-1} and 2841.66 cm^{-1} to 3254.72 cm^{-1} and 2921.34 cm^{-1} while peak of βCD at 1023.99 cm^{-1} was shifted to 1019.16 cm^{-1}. For QUN-HPβCD-POLO ternary complex, the prominent peaks at 3310.76 cm^{-1} ,2918.55 cm^{-1} ,1596.69 cm^{-1} and 1015.89 cm^{-1} were observed All other peaks had either shifted, disappeared or appeared with less intensity. All these changes confirm the strong physical interaction between QUN and both βCD and HPβCD in the presence of POLO.

2.2.3. XRPD analysis

The XRPD patterns of QUN and all complexes are presented in Figure 5. The diffractogram of QUN exhibited prominent peaks at 12.5, 27.3 and 27.4 (2θ) with peak intensities 784, 969 and 1135 respectively indicating crystalline nature of drug. The peak intensities for βCD at 12.7, 18.9, 20.9 and 27.2 (2θ) recorded were 1751, 2025, 1577, and 1459 respectively. A typical halo-pattern was recorded for HPβCD, which showed peak at 18.3(2θ) with peak intensity 1786 indicating its amorphous nature.

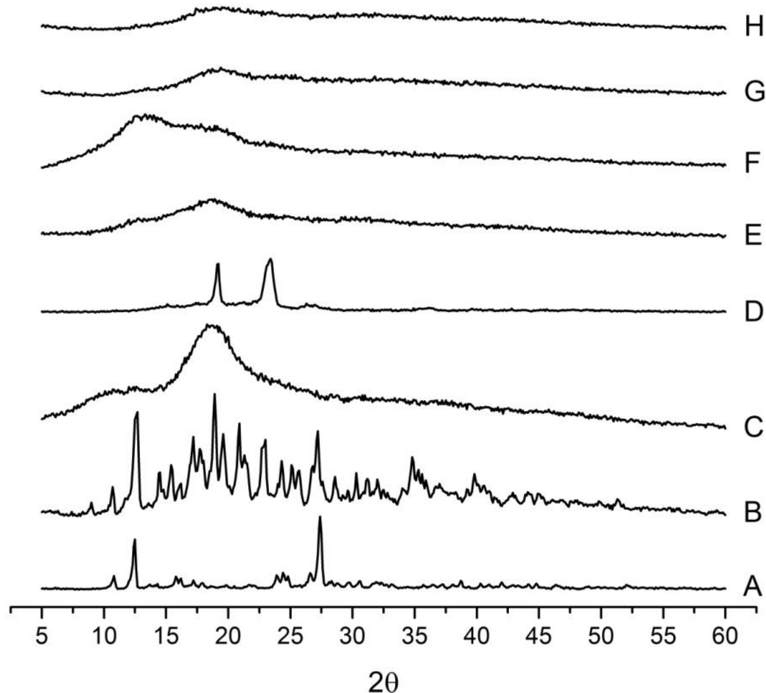

Figure 5. XRPD pattern of QUN (A), βCD (B), HPβCD (C), POLO (D), QUN-βCD (E) and QUN-HPβCD (F) binary complexes, QUN-βCD-POLO (G) and QUN-HPβCD-POLO (H) ternary complexes.

All the prepared inclusion complexes of QUN exhibited characteristic halo pattern and significant reduction in peak intensities, as compared to pure QUN, confirming reduction in the crystallinity of QUN. The intensity of characteristic peak of QUN at 27.4 (2θ) was reduced to 382 and 323 in case of QUN-βCD and QUN-HPβCD respectively. For QUN-βCD-POLO and QUN-HPβCD-POLO ternary complexes, the intensity of the same peak was reduced to 313 and 272 respectively. This indicates that QUN-HPβCD-POLO ternary complex exhibited greater amorphization of QUN. The presence of fine peaks in the spectra of complexes may be due to presence of free uncomplexed QUN to some extent in the complex samples.

2.2.4. SEM analysis

SEM was used to study the surface morphology of pure drug and complexes (Figure 6). The micrographs of pure drug exhibited presence of long cylindrical/needle shaped crystals. The images of freeze dried inclusion complexes showed a significant change in the morphology of the particles. Both change in shape (needle to flaky) and reduction in particle size were observed which indicates an interaction in between QUN and CDs in presence or absence of POLO, resulting into amorphization of QUN. According to the previous reports, a change in the shape of the crystals and aspects of drug indicates its complexation with CD [28,29].

2.3. Percentage drug content and saturation solubility studies

Table 3 presents the drug content (%) and saturation solubility of the physical mixtures and the prepared complexes. The drug content was found to be uniform in all the physical mixtures and complexes ranging within 95.37 to 98.86%.

Table 3. Percentage drug content and saturation solubility of the physical mixtures and complexes

QUN/CD complexes	Drug content (%)*	Solubility in water at 25°C mg/mL*
Pure QUN	-	0.0047± 0.0003
QUN/βCD (PM)	98.73±1.01	0.0071±0.0002
QUN/βCD (FDC)	95.37±1.51	0.0159±0.0002
QUN/βCD/POLO (PM)	97.32±0.85	0.0098±0.0007
QUN/βCD/POLO (FDC)	96.38±0.79	0.0505±0.0142[ab]
QUN/HPβCD (PM)	98.04±1.08	0.0140±0.0060
QUN/HPβCD (FDC)	98.86±1.49	0.0451±0.0019[abc]
QUN/HPβCD/POLO (PM)	97.11±1.22	0.0183±0.0024
QUN/HPβCD/POLO (FDC)	96.81±0.71	0.1602±0.0053[abcd]

* indicates mean of 3 readings + standard deviation
[a] indicates significantly different value as compared to QUN
[b] indicates significantly different value as compared to QUN/βCD (FDC)
[c] indicates significantly different value as compared to QUN/βCD/POLO (FDC)
[d] indicates significantly different value as compared to QUN/HPβCD/POLO (FDC)

The QUN-βCD and QUN-HPβCD binary complexes increased the solubility of QUN by 3.4 and 9.6 folds respectively. On the other hand, QUN-βCD-POLO and QUN-HPβCD-POLO ternary complexes increase the solubility of QUN by 10.7 and 34.1 folds respectively. The physical mixtures showed slight enhancement in the solubility of QUN; however it was significantly less ($p<0.05$) as compared to the complexes containing similar components. The dramatic improvement in the solubility of QUN in case of QUN-HPβCD-POLO ternary complexes can be ascribed to the formation of stable inclusion complex, and reduction in the crystallinity of drug. Besides, micellization of poloxamer chains may also contribute to some extent in enhancing the solubility of QUN.

2.4. Anti-inflammatory activity

The results for anti-inflammatory activity with respect to change in paw volume and % inhibition of paw inflammation (Mean ± Std. Error) by using Carrageenan-induced rat paw edema method are shown in Figure 7. The positive control i.e. indomethacin decreased the paw volume by 28.07% after two hours. The percent inhibition of paw volume in case of QUN-HPβCD-POLO ternary complex is 44.60% which is more as compared to pure QUN (27.55%), indicating increased anti-inflammatory activity. The increased anti-inflammatory activity confirmed the increase in bioavailability of QUN due to formation of stable inclusion complex between QUN and CDs in presence of POLO and improvement in its solubility.

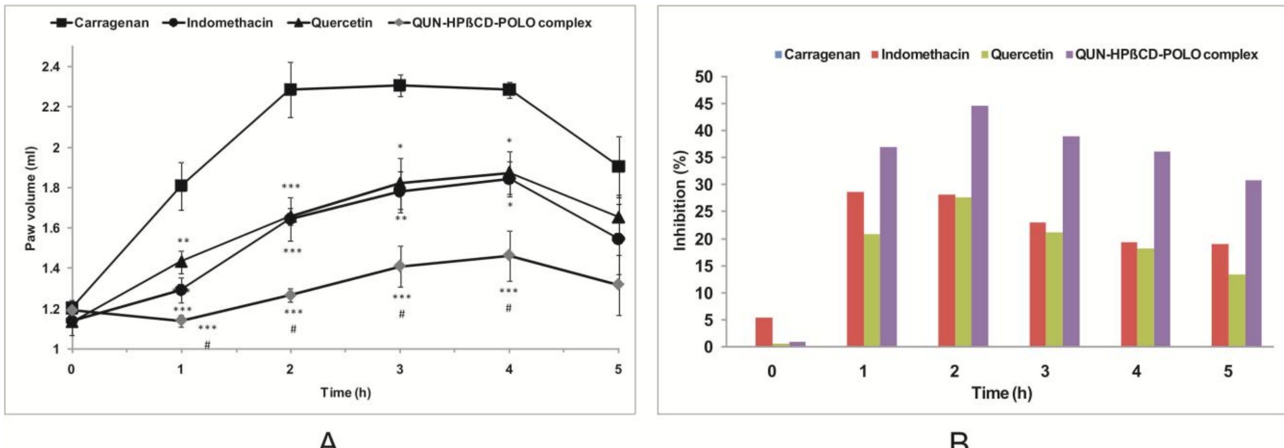

Figure 7. Anti-inflammatory activities of QUN and QUN-HPβCD-POLO ternary complex by Carrageenan-induced rat paw edema method: A- Effect on paw volume (ml); B- Inhibition of inflammation (%). * indicates significant difference of paw volume with respect to control (*- $p<0.05$; **- $p<0.01$; ***- $p<0.001$) and # indicates significant difference of paw volume with respect to QUN treated group (#- $p<0.05$).

3. CONCLUSION

The stability and complexation efficiency of βCD and HPβCD was markedly improved by POLO than the other hydrophilic polymers. QUN-βCD-POLO and QUN-HPβCD-POLO ternary complexes were successfully prepared using the lyophilization method. DSC and ATR-FTIR analysis helped to confirm the formation of inclusion complex whereas XRPD and SEM analysis revealed amorphous nature of the complexes. QUN-HPβCD-POLO complex showed high solubility than the other binary and ternary complexes. An increase in the in vivo anti-inflammatory activity of the QUN-HPβCD-POLO ternary complex clearly indicates enhancement in the bioavailability of QUN.

4. MATERIALS AND METHODS

4.1. Materials

QUN, βCD and polyvinylpyrrolidone K30 (PVP) were purchased from Himedia Laboratories Pvt. Ltd., Mumbai, India. HPβCD (DS: 4.69) was obtained as a gift sample from Gangwal Chemicals, Mumbai, India. Hydroxypropylmethylcellulose E15LV (HPMC) was purchased from Loba Chemie, Mumbai, India and Poloxamer 188 (POLO) was obtained from Signet Chemicals, Mumbai, India. The analytical grade reagents and glass distilled water were used (for the experimental procedures) throughout the experimental procedures.

4.2. Phase solubility studies

The phase solubility studies were performed in distilled water at room temperature (25 ± 2°C) according to the method reported by Higuchi and Connors [16]. The excess quantity of QUN was added to 20 mL of βCD and HPβCD solutions (0 to 0.01 M) in the presence and absence of auxiliary substances (0.5%w/v of HPMC, PVP and POLO). The concentration of polymers was decided on the basis of the preliminary studies. The solubility of QUN in presence of fixed amount of CDs (10mM) and increasing polymer concentration (0.25, 0.5, 0.75, 1, 1.5 and 2%w/v) was determined. The polymer concentration at which maximum QUN was solubilized was selected (i.e. 0.5%w/v). The resultant suspensions were shaken for 72 h at 150 rpm using

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

rotary shaker (Lab HOSP, India) to attain equilibrium. Thereafter, suspensions were filtered using Whatman filter paper No. 41, appropriately diluted if necessary and analyzed to determine concentration of QUN using UV-spectrophotometer (Shimadzu 1800, Japan) at 371 nm. The stoichiometry between QUN and CDs was established from the phase solubility curves obtained by plotting the concentration of dissolved QUN (moles/liter) against the respective concentration of CDs (moles/liter). The stability constants (K_S) of the binary and ternary complexes were calculated using the equation [30].

$$K_s = \frac{Slope}{S_0\,(1 - Slope)} \qquad \text{(Eq. 1)}$$

Where, S_0 is the solubility of QUN in distilled water.

The complexation efficiency (C.E.) of CDs was determined by the following equation [30].

$$C.E. = K_s S_0 = \frac{Slope}{(1 - Slope)} \qquad \text{(Eq. 2)}$$

Gibbs free energy change (ΔG_{tr}) in Joules/mole was also calculated to assess the thermodynamics of the solution and complexation process, using the equation

$$\Delta G_{tr} = -2.303\, RT log \frac{S_c}{S_0} \qquad \text{(Eq. 3)}$$

Where, S_c is molar solubility of QUN in aqueous solution of HPβCD or βCD in the presence or absence of hydrophilic polymer, S_0 is molar solubility of QUN in distilled water, R is gas constant and T is temperature in Kelvin.

4.3. Preparation of freeze dried solid inclusion complexes

The method reported by Tayade et al [5] was used for preparation of binary and ternary complexes. The equimolar weighed quantities of QUN and CDs, were dissolved in distilled water (70 mL). To this aqueous solution, 25% ammonia (1.5 mL) was added to dissolve QUN. The resultant solutions were stirred using a magnetic stirrer (2MLH, Remi laboratory Instruments, Mumbai), for 2 h at a room temperature (25 ± 2°C) and were frozen in deep freezer (ELCOLD) at -80°C for 24 hours. The frozen solutions were lyophilized (DELVAC-mimiLyodel) and stored in desiccators till further use.

In case of ternary complexes, same procedure was followed by addition of POLO (0.5 %w/w) in the complexation media. The physical mixtures of binary and ternary systems of QUN, CDs and POLO were prepared in order to compare their solubility with the complexes.

4.4. Characterization of complexes

4.4.1. Differential scanning calorimetry (DSC)

DSC analyzer (TA instuments Q600 SDT USA) was used to perform DSC analysis of QUN, βCD, HPβCD, POLO and all complexes. A sample (5 mg) was sealed in an aluminum pan and subjected to heating at a rate of 10 °C /min from 30–400 °C under nitrogen atmosphere.

4.4.2. Attenuated Total Reflectance-Fourier Transform Infrared Spectroscopy(ATR-FTIR)

Attenuated total reflectance (ATR)-Fourier transform infrared spectroscopy (FTIR) (BRUKER–ECO-ATR-ALPHA, Germany) was used for recording infrared spectra of QUN, βCD, HPβCD, POLO and prepared complexes. ATR-FTIR helps in direct analysis of the solid or liquid samples and does not require any complex sample preparation procedure. The samples were directly placed on ATR crystal and analyzed from 600 to 4000 cm^{-1} spectral range with 24 scans.

4.4.3. X-ray powder diffractometry (XRPD)

The XRPD analysis of all samples were performed by using X-ray diffractometer (PW 1723, PHILIPS, Netherland) with tube anode Cu over the interval 05-60° (2θ). Generator tension (voltage) 40 kV, Generator current 30 mA, and scanning speed 2°/min. were maintained during the operation.

4.4.4. Scanning electron microscopy (SEM)

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Scanning electron microscope (SEM-JOEL Instruments, JSM-6360A, Japan) was used for studying surface morphology of QUN and all complexes. Samples were directly mounted on the aluminum stub and coated with a thin gold-ion layer using sputter coated unit an acceleration voltage of 5 kV was applied and the micrographs were examined at ×300, ×1000 and ×3000 magnifications.

4.5. Determination of drug content

The content of QUN in the physical mixtures and complexes was determined by adding the physical mixtures/complexes equivalent to 5 mg of QUN in 50 ml of methanol. The resultant mixtures were stirred on the magnetic stirrer for 3h. The solutions were filtered through Whatman filter paper No. 41, suitably diluted and analyzed spectrophotometrtically at 371 nm.

4.6. Saturation solubility studies

The saturation solubility of the pure QUN, physical mixtures and the complexes was determined using the method described by Higuchi and Connors [16]. Excess quantity of pure QUN and, prepared physical mixtures and complexes were added to the conical flasks each containing 10 ml of distilled water and sealed. The mixtures were shaken using rotary flask shaker for 72 h at room temperature to attain equilibrium. Appropriate fractions were withdrawn and filtered through Whatman filter paper No. 41 and analyzed spectrophotometrically at 371 nm.

4.7. Anti-inflammatory activity

The anti-inflammatory activity of optimized complex of QUN was evaluated in *vivo* as per the approval from Institutional Animal Ethics Committee (IAEC) of College of Pharmacy, Bhor, Maharashtra, India (Approval No. RDCOP/IAEC/Approval/2016-17/03 dated 08/08/2016). Carrageenan-induced rat paw edema method was used as reported previously [31,32].

4.7.1. Experimental design

The Wistar albino rats, 150-180 g of either sex were randomly divided into four groups of six rats in each.

Group	Dose
I . Control	Treated with Normal saline
II. Reference Standard: Indomethacin	10 mg/kg of body weight
III. Pure drug: QUN	10 mg/kg of body weight
IV. Test sample: QUN-HPβCD-POLO	Equivalent to 10 mg of QUN/kg of body weight

To produce acute inflammation, 0.1 ml of 1% freshly prepared carrageenan solution in normal saline was injected in right hind paw of rats by sub-plantar route. Control group rats were treated with normal saline, reference standard group with indomethacin (10mg/Kg body weight per oral), third group with pure QUN 10 mg/ Kg body weight per oral and the test group with QUN-HPβCD-POLO ternary complex; quantity equivalent to 10 mg of QUN/Kg body weight per oral respectively one hour prior to carrageenan injection. The paw volume was measured using plethysmometer at an interval of 1, 2, 3, 4 and 5 hrs after carrageenan injection and increase in mean paw volume in ml (Mean ± Standard Error) and % inhibition of paw inflammation was calculated.

The percentage inhibition of paw inflammation was calculated using the formula:

$$\%\ inhibition\ of\ inflammation = \frac{(Control\ mean - Treated\ mean)}{Control\ mean} \times 100 \quad \text{(Eq. 4)}$$

4.8. Statistical analysis

All values were shown as Mean ± Standard Error Mean (S.E.M.). Statistical analysis was performed using one-way analysis of variance (ANOVA). $P<0.05$ was considered statistically significant.

ABSTRACT

Heavy metals are natural components of the Earth's crust. They cannot be degraded or destroyed. Eight common heavy metals are discussed in this brief: arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver. Even these metals do not have any biological role, they remain present in our body harms human body and its functioning. As all ayurvedic formulation contains large amount of heavy metals due to the herbal ingredients used for preparation. One of the ayurvedic formulation from among formulation i.e. Shankh-vati tablet. We have studied the amount of heavy metals present in shankh-vati tablet. Shankh-vati is and ayurvedic classical formulation available in tablet form which is used to manage the digestive disorders. It is also used to resolve the various problems like anorexia, vomiting, gastritis etc. Natural ingredients used in this medicine help to balance the tridoshas in body. Shankh-vati totally contains 15ingredients. Mainly parad (mercury) is mostly used in ayurvedic formulation. Mercury is present in large amount in ayurvedic formulation. Along with determination of heavy metals, limit test for iron and sulfate is also done. Sulfate occur as microscopic particles(aerosols) resulting from fossil fuel and biomass combustion. They increase the acidity of the atmosphere and form acid rain. The limit test has passed which confirms that heavy metals in shankh-vati tablet is in limit. Also other metals like iron and sulfate are in limit.

KEYWORDS: Shankh-vati Tablet, Heavy Metals, Toxicity, Mechanisms of Heavy Metals, Limit tests.

INTRODUCTION

Heavy Metals

A metal of relatively high density (specific gravity greater than about 5 g/cm^3) or of high relative atomic weight is defined as a heavy metal. The term "Heavy metals" is used to describe more than a dozen elements that are metals or metalloids ex; chromium, arsenic, cadmium, lead, mercury, manganese, etc. Heavy metals are natural constituents of the Earth's crust. Heavy metals cannot be destroyed nor degraded. In small amounts, they enter the human body via food, drinking water and air. Living organisms require varying amounts of "heavy metals". Iron, cobalt, copper, manganese, molybdenum, and zinc are required by humans. Therefore, heavy metals can be described as any metallic element that has a relatively high density and is toxic or poisonous at low concentrations. Human activities affect the natural geological and biological distribution of heavy metals through pollution of air, water, and soil. Heavy metals which are toxic are realsed by humans only. Bioaccumulation refers to an increase in the concentration o f a metal in a biological organism over time, compared to the normal concentration in the environment.[25] Some heavy metals like mercury and lead are toxic metals that have no known vital or beneficial effect on organisms, and their accumulation over time in the bodies of animals can cause serious illness of harmful effects. Certain elements that are normally toxic are, for certain organisms or under certain conditions, may be beneficial. Therefore, they tend to accumulate in the soil, seawater, freshwater, and sediments. In small quantities, certain heavy metals are nutritionally essential for a healthy life (e.g., iron, copper, manganese, and zinc). Some of these are referred to as the trace elements. These elements, or some form of them, are commonly found naturally in foodstuffs, in fruitsand vegetables, and in commercially available multivitamin products.As some ayurvedic formulation also includes needed essential heavy metals. The ayurvedic formulations contain required amount of the essential heavy metals which are useful for lives. There are many types of different ayurvedic formulations in which all of them contains heavy metals. Although it is acknowledged that heavy metals have many adverse health effects and last for a long period of time, heavy metal exposure continues is increasing in many parts of the world. Heavy metals are significant environmental pollutants and their toxicity is a problem of increasing significance for ecological, evolutionary, nutritional and environmental reasons. The most commonly found heavy metals in waste water include arsenic, cadmium, chromium, copper, lead, nickel, and zinc, all of which cause risks for human health and the environment. Various sources of heavy metals include soil erosion, natural weathering of the earth's crust, mining, industrial

DIRECTOR
Yashoda Technical Campus
Satara

effluents, urban runoff, sewage discharge, insect or disease control agents applied to crops, and many others.[24] These metals bind with protein sites which are not made for them by displacing original metals from their natural binding sites causing malfunctioning of cells and ultimately toxicity. Previous research has found that oxidative deterioration of biological macromolecules is primarily due to binding of heavy metals to the DNA and the nuclear proteins.[11]

Shankh-vati is an Ayurvedic formulation or medicine available in tablet form which is used to manage the digestive disorders. Calmative action of shankh-vati helps to provide relief in the burning sensation of stomach, also helps to improve the body's ability to absorbs the nutrition in a natural way. It is mainly prepared by triturating the fine powder of ingredients with lemon juice to prepare a paste. From which paste, tablets are prepared, dried and stored.

The toxic effects of these metals, even though they do not have any biological role, remain present in some or the other form harmful for the human body and its proper functioning. They sometimes act as a pseudo element of the body while at certain times they may even interfere with metabolic processes.

Various public health measures have been undertaken to control, prevent and treat metal toxicity occurring at various levels, such as occupational exposure, accidents and environmental factors.

Physiological roles of heavy metals in humans

- Iron – hemoglobin, myoglobin
- Cobalt – coenzyme
- Copper – co-factor in enzymes
- Zinc – in enzymes
- Selenium – in enzymes
- Chromium – Cr^{3+} in enzyme

Uses of heavy metals

- Mercury is found in batteries, dental amalgam, vacuum pumps and valves. Airborne mercurycomes from the combustion of diesel, jet fuel and heating oil.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

- Arsenic is high in seafood and may also be found as a contaminant in animal feeds. It is also present in wood preservatives, herbicides, corrosion inhibitors, in lead and copper alloys.
- Cadmium is used industrially as an anti-friction agent, as a rust-proofer, in plastics manufacture, in alloys and in alkaline storage batteries.
- Chromium is found in fresh foods, copy machine toner and nickel in coins, kitchen utensils and milk.
- Copper is essential to all living organisms and has a wide range of effects depending on concentration and chemical formulation. It is used in the electrical industry in alloys such as brass, in chemical catalysts and in wood-preservatives.
- Lead has been used in batteries, electronic equipment's, in petrol, toys, paint, etc. Lead has been used as fuel additive in many countries for several years, although this practice has since stopped in most of the countries of the world, because of the health implications of lead.
- Manganese compounds are used in manufacturing of products such as batteries, steel and unleaded petrol. Manganese dioxide is commonly used in the production of dry-cellbatteries, matches, fireworks, porcelain and glass-bonding materials. It is also used as thestarting material for the production of other manganese compounds.
- Manganese chloride is a precursor of other manganese compounds. It is used as a catalyst inthe chlorination of organic compounds, in animal feed to supply essential trace minerals andin dry-cell batteries. Manganese sulfate is used as a fertilizer, livestock nutritional supplement and in ceramics.

Effects of heavy metals on human

Humans are always exposed to the natural levels of trace elements. Under normal circumstances; the body is able to control some of these amounts. However, continuous exposure to elevated levels of metals could cause serious illness or death. Increased exposure is due to contaminated soil and other industrial wastes which affects the skin.

There are 35 metals that are of concern for us because of residential or occupational exposure, out of which 23 are heavy metals: antimony, arsenic, bismuth, cadmium, cerium, chromium, cobalt, copper, gallium, gold, iron, lead, manganese, mercury, nickel, platinum, silver, tellurium, thallium, tin, uranium, vanadium, and zinc. These heavy metals are

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

commonly found in the environment and diet. In small amount they are required for maintaining good health but in larger amounts they can become toxic or dangerous.

The health hazards presented by heavy metals depend on the level and the length of exposure. In some cases, the health effects are immediately apparent; in others, the effects are delayed.

High levels of toxic metals deposited in body tissues and subsequently in the brain, may cause significant developmental and neurological damage, including depression,increased irritability, anxiety, insomnia, hallucination, memory loss, aggression and many other disorders. Heavy metal toxicity can lower energy levels and damage the functioning of the brain, lungs, kidney, liver, blood composition and other important organs.

MATERIALS AND METHODS

Shankh-Vati

Shankh-vati, an ayurvedic medicine available in tablet form which is used to manage the digestive disorders. This remedy is quite effective to improve the digestive fire in the body and also helps to strengthen the digestive system. It is quite good to resolve the various problems like anorexia, vomiting, gastritis etc. For anorexia, it helps to improve the digestion and appetite as well. Natural ingredients, used in this medicine help to balance the tridoshas in body. Works well in the problem of excessive gas, flatulence, burping etc. Calmative action of Shankh-vati helps to provide relief in the burning sensation of stomach, also helps to improve the body's ability to absorb the nutrition in a natural way.

It contains heavy metals ingredients and hence should only be used under strict medical supervision. 15 varieties of shankh-vati were found available across different across different Ayurveda texts. Shankha bhasma, Hingu, Vatsanabha, Trikatu, Kshara and Lavana are the ingredients common to most varieties of Shankha Vati.Shankh-vati is a classical Ayurvedic formulation that is widely used by the practitioners of Ayurveda, contains a heavy metal i.e. Parad(mercury) and a poisonous herbal drug i.e. Vatsanabha (Aconitum chasmantum Staffex Holmes) along with other ingredients. There are certain apprehensions on this formulation, mainly due to the presence of its ingredients Vatsanabha Shankha Vati(Bhaishajya Ratnavali 10/186-187, also in Ayurvedic Formulary of India part 1), is one of the formulations in which Vatsanabha is used without its usual coingredient and antidote Tankana (Borax).

Fine powder of each of

Panchalavana\Ingredients

1. Saindhava Lavana- Rock salt
2. Sauvarchala Lavana- Sochal salt
3. Samudra Lavana- Common salt
4. Vida Lavana- Vida salt
5. Nimbu swarasa- Lemon juice- Quantity Sufficient
6. Shankha Bhasma- Bhasma of Conch Shell
7. Hingu- Asafoetida
8. Shunti- Ginger Rhizome – *Zingiber officinalis*
9. Maricha- Black pepper- *Piper nigrum*
10. Pippali- Long pepper fruit- *Piper longum*
11. Purified Mercury- Parad
12. Vatsanabha- Aconitum ferox
13. Shuddha Gandhaka
14. Krishna Lavana

Uses

1. Dyspepsia
2. Low digestion power
3. Anorexia
4. Peptic diseases
5. Emaciation
6. Improper digestion
7. Excessive gas
8. Gulma
9. Burning sensation in stomach

Dosage

1-2 tablets (250-500 mg) once or twice in a day, before or after food or as directed by ayurvedic doctor.

Precautions[9]

1. This medicine should be strictly taken under the medical supervision.
2. It should be avoided by pregnant, lactating mothers and children.

DIRECTOR
Yashoda Technical Campus
Satara

3. Over dosage may cause slight burning sensation in stomach.
4. For high BP patients this medicine should be taken with care as it contains salt as an ingredient.
5. Keep out of reach and sight of children.
6. Store in a cool dry place.

Mercury

The metallic mercury is a naturally occurring metal which is a shiny silver-white, odorless liquid and becomes colorless and odorless gas when heated. Mercury is very toxic and exceedingly bio accumulative. Major sources of mercury pollution include anthropogenic activities such as agriculture, municipal wastewater discharges, mining, incineration, and discharges of industrial wastewater.[10]

Mercury exists mainly in three forms

1. Metallic elements
2. Inorganic salt
3. Organic compounds

Each of which possesses different toxicity and bioavailability. These forms of mercury are present widely in water resources such as lakes, rivers and oceans where they are taken up by microorganisms and get transformed into methyl mercury within the microorganism, eventually undergoing bio magnifications causing significant disturbance to aquatic lives. Consumption of this contaminated aquatic animal is the major route of human exposure to methyl mercury. Mercury is extensively used in thermometers, barometers etc. Mercury poisoning symptoms include blindness, deafness, brain damage, digestive problems, kidney damage, lack of coordination and mental retardation. One of the most famous cases of mercury poisoning resulting from chronic exposure was the disaster that occurred in Minamata, Japan, where methylmercury was discharged from a plastics manufacturing plant into the waters of Minamata Bay in the 50s and 60s. This is reflected in its abundance in the earth's crust as oxides, carbonates, silicates with iron, magnesium and as sulphides, arsenide's and telurides. Nickel salts are soluble and can occur as a leachate from nickel bearing rocks.[20] It is also a known 'carcinogen'.

Mercury is considered the most toxic heavy metal in the environment. Mercury poisoning is referred to as acrodynia or pink disease. Mercury is released into the environment by the

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

activities of various industries such as pharmaceutical, papers and pulp preservatives, agriculture industry, and chlorine and caustic soda production industry. Mercury has ability to combine with other elements and form organic and inorganic mercury. Exposure to elevated levels of metallic, organic, and inorganic mercury can damage brain, kidneys and the developing fetus. Mercury is present in most foods and beverages in the range <1 to 50ug/kg. In marine foods it is often seen at higher levels.

Micro-organisms convert the mercury present in soil and water into methyl mercury, a toxin which can accumulate with fish age and with increasing trophic levels. EPA has declared mercuric chloride and methyl mercury to be highly carcinogenic. The nervous system is very sensitive to all types of mercury. Increased exposure of mercury can alter brain functions and lead to shyness, tremors, memory problems, irritability, and changes in vision or hearing.

Exposure to metallic mercury vapors at higher levels for shorter periods of time can lead to

Damage to lungs, Vomiting, Diarrhea, Nausea, Skin rashes, Increased heart rate or blood pressure.

Symptoms of organic mercury poisoning include

1. Depression
2. Memory problems
3. Tremors
4. Fatigue
5. Headache
6. Hair loss etc.

Since these symptoms are common also in other conditions, it may be difficult to diagnose such cases. Due to the excess health effects associated with exposure to mercury, the present standard for drinking water has been set at lower levels of 0.002 mg/L and 0.001mg/L by the Environmental Protection Act and World Health Organization.

Mechanism of mercury toxicity

The brain remains the target organ for mercury, yet it can impair any organ and lead to malfunctioning of nerves, kidneys and muscles. It can cause disruption to the membrane potential and interrupt with intracellular calcium homeostasis. Mercury binds to freely

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

available thiols as the stability constants are high. Mercury vapours can cause bronchitis, asthma and temporary respiratory problems. Mercury plays a key role in damaging the tertiary and quaternary protein structure and alters the cellular function by attaching to the selenohydryl and sulfhydryl groups which undergo reaction with methyl mercury and hammer the cellular structure. It also intervenes with the process of transcription and translation resulting in the disappearance of ribosomes and eradication of endoplasmic reticulum and the activity of natural killer cells. The cellular integrity is also affected causing free radical formation. The basis for heavy metal chelation is that even though the mercury sulfhydryl bond is stable and divided to surrounding sulfhydryl consisting ligands, it also contributes free sulfhydryl groups to promote metal mobility within the ligands.[4]

Procedure[2]

1. Take powder 0.5gmof tablet, treat it with 7 ml of concentrated nitric acid, add 15ml concentrated sulphuric acid in kjeldahl flask.
2. Heat the mixture under reflux gently strongly for 30min.
3. Cool the mixture and add 50ml of concentrated nitric acid to remove brown fumes.
4. Continue the addition of concentrated nitric acid and boiling until liquid is colourless. Cool, wash the condenser with 100ml of water.
5. Remove flask add 1.0% potassium permanganate solution dropwise until pink colour persist.
6. Decolorize it by adding 6.0% hydrogen peroxide dropwise to remove excess potassium permanganate followed by 3.0ml concentrated nitric acid.
7. Titrate with 0.1N ammonium thiocyanate solution using ferric alum as indicator.

Each ml of 0.1N ammonium thiocyanate solution is equivalent to 0.01003gm mercury.

Observation table

0.1N Ammonium thiocyanate as titrant	
Burette reading	**Mean(ml)**
2.5ml	2.5ml
2.5ml	
2.5ml	

Factor: - As each ml of 0.1N ammonium thiocyanate solution is equivalent to 0.01003gm of mercury.

2.5ml of 0.1N ammonium thiocyanate contains 0.025015gm of mercury.

Iron

Iron is the second most abundant metal on the earth's crust. Iron is the most abundant transition metal in the earth's crust. Biologically it is the most important nutrient for most living creatures as it is the cofactor for many vital proteins and enzymes. Iron occupies the 26^{th} elemental position in the periodic table. Iron is a most crucial element for growth and survival of almost all living organism. It is one of the vital components of organisms like algae and of enzymes such as cytochromes and catalase, as well as of oxygen transporting proteins, such as hemoglobin and myoglobin. Iron is an attractive transition metal for various biological redox processes due to its inter-conversion between ferrous and ferric ions. The source of iron in surface water is anthropogenic and is related to mining activities.

Iron occurs as particulate ferric hydroxide or in the form of organometallic compound in natural system. Fe (III) oxide and Fe (II) are ubiquitous in anoxic environments and they affect the distribution, transport, and biogeochemistry of chemical contaminants by absorption onto Fe(III) oxides and by control of oxidation and reduction reactions. Iron is regarded as one of the essential elements for humans. Approximately 3000 to5000 mg of iron exists in the human body. Therefore, as long as the quantity of iron in the environment is not too large, it may not be harmful to the human body.[1]

However, iron can cause undesirable problems in industrial processes or ecosystems if itsconcentration in water is not managed properly. WHO has recommended a value of 0.3mg/L as permissible limit for drinking water. For fresh Chronic excessive intake of iron may lead to hemosioderosis or hemochromatosis. Iron constitutes about 4.7 % of the earth's crust. It is the second most importantmetallic element in the terrestrial environment. Iron is extremely useful, but can also behighly toxic to cellular constituents when present in excess. Iron is an important part of theplant's oxidation- reduction reactions. Iron is a structural component of cytochromes, hemes, and numerous otherelectron-transfer systems, including nitrogenase enzymes necessary for the fixation ofdinitrogen gas. The major problem with iron availability is how to keep iron sufficientlysoluble for plants to absorb enough of it. In strongly acidic solutions (pH < 5), iron becomesincreasingly soluble, and is rarely deficient It is essential for the physiological processes ofall living organisms.

The production of sulphuric acid and the discharge of ferrous takes place due oxidation of iron pyrites that are common in coal seams. The concentration of dissolved iron in the deep ocean is normally 0.6nM or 33.5x10-9 mg/L. In freshwater the concentration is very low with

DIRECTOR
Yashoda Technical Campus
Satara
YASHODA TECHNICAL CAMPUS SATARA

a detection level of 5 ug/L-ICP, whereas in groundwater the concentration of dissolved iron is very high with 20 mg/L.A study of iron toxicity on aquatic plants, particularly rice, reported that the growth of species of aquatic reed was found to be inhibited by concentration of 1 mg/L total iron. Acid soils restrict rice production and together with Zn deficiency cause a macronutrient disorder in wetland rice. The production of lowland rice was greatly affected by high concentrations of reduced iron in the flooded soils. The features of iron toxicity in rice include high uptake of fe2+ by roots, acropetal translocation into leaves, bronzing of rice leaves and yield loss.[20]

Children's are highly susceptible to iron toxicity as they are exposed to a maximum of iron-containing products. Iron toxicosis occurs in four stages;

- First stage: This stage occurs after 6 hours of iron overdose is marked by gastrointestinal effects such as gastrointestinal bleeding, vomiting and diarrhea.
- Second stage: The second stage progresses within 2 to 4hrs of overdose and it is considered as the latent period, a period of apparent medical recovery.
- Third stage: The third stage occurs between 2 to 24 hrs. After the onset of certain clinical symptoms. This stage is characterized by shocks, hypotension, lethargy, tachycardia, hepatic necrosis, metabolic acidosis and sometimes death.
- Fourth stage: The fourth stage occurs within 12 to 24hrs of iron overdose. This stage is marked by the formation of gastrointestinal ulcerations and development of strictures.
- Fifth stage: These stage occurs within 1 to 7weeks.

Mechanism of iron toxicity

A wide range of harmful free radicals are formed when the absorbed iron fails to bind to the protein, which in turn severely affects the concentration of iron in mammalian cells and biological fluids. This circulating unbound iron results in corrosive effect of the gastrointestinal tract and biological fluids. An extremely higher level of iron enters into the body crossing the rate-limiting absorption step becomes saturated. These free irons penetrate into cells of the heart, liver and brain. Due to the disruption of oxidative phosphorylation by free iron, the ferrous iron is converted to ferric iron that releases hydrogen ions, thus increasing metabolic acidity. The free iron can also lead to lipid peroxidation, which results in severe damage to mitochondria, microsomes and other cellular organelles. The toxicity of iron on cells has led to iron mediated tissue damage involving cellular oxidizing and reducing mechanisms and their toxicity towards intracellular organelles such as mitochondria and

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

lysosomes. A wide range of free radicals that are believed to cause potential cellular damage are produced by excess intake of iron. The iron produced hydrogen free radicals attack DNA, resulting in cellular damage, mutation and malignant transformations which in turn cause an array of diseases.[1]

Procedure[31]

Standard

1. Take 2.0ml of iron standard solution (20 ppm fe) in labeled Nessler's cylinder (S).
2. Add 2ml of a 20% w/v solution of iron free citric acid.
3. And add 0.1ml of thioglycollic acid, mix well, make alkaline with iron free ammonia solution.
4. Dilute to 50ml with water and allow to stand for 5 minutes.

Test

1. Weigh accurately 2.5g of zinc sulphate and dissolve in sufficient carbon dioxide free water to produce 50ml in a beaker. Take 2.0ml of solution and diluted to 10ml with water in a labeled Nessler's cylinder(T).
2. Add 2ml of a 20% w/v solution of iron-free citric acid.
3. And add 0.1ml of thioglycollic acid, mix well and make alkaline with iron free ammonia solution.
4. Dilute to 50ml with water and allow to stand for 5minute.
5. View the colour intensity against white background and compare with that of standard.

Observation: The colour intensity produced in test solution is **same** as the colour intensity produced in standard solution.

Inference: -The given sample of shankh-vati tablet complies the limit for iron.

Lead

Lead is a highly toxic metal whose widespread use has caused extensive environmental contamination and health problems in many parts of the world. Lead is a bright silvery metal, slightly bluish in a dry atmosphere. It begins to tarnish on contact with air, thereby forming a complex mixture of compounds, depending on the given conditions. The sources of lead exposure include mainly industrial processes, food and smoking, drinking water and domestic sources. The sources of lead were gasoline and house paint, which has been extended to lead bullets, plumbing pipes, pewter pitchers, storage batteries, toys and faucets. In the US, more

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

than 100 to 200,000 tons of lead per year is being released from vehicle exhausts. Some is taken up by plants, fixation to soil and flow into water bodies, hence human exposure of lead in the general population is either due to food or drinking water.

Lead is extremely toxic heavy metal that disturbs various plant physiological processes and unlike other metals, such as zinc, copper and manganese, it does not play any biological functions. A plant with high lead concentration fastens the production of reactive oxygen species(ROS), causing lipid membrane damage of chlorophyll and photosynthetic processes and suppresses the overall growth of the plant. Metallic lead does not dissolve in water and does not bum, however, lead can combine with other chemicals to form lead compounds or lead salts. Some lead salts dissolve in water better than others. Although lead itself cannot be broken down, lead compounds in water may combine with different chemicals depending on the acidity and temperature of the water.

Most of the lead used by industry comes from mined ores (primary) or from recycled scrap metal or batteries (secondary). The main sources of lead pollution are lead smelters, battery manufacturers, paper and pulp industries, boat and ship fuels and ammunition industries. In addition, the production of television picture tubes, pigments, petroleum fuels, printing, glass industries, photographic materials, etc., also adds Pb(II) to the environment. People living near hazardous waste sites may be exposed to lead by breathing air, drinking water, eating foods, or swallowing or touching dust or dirt that contains lead.

Cigarette smoke also contains small amounts of lead. Lead may enter foods if they are put into improperly glazed pottery or ceramic dishes and from leaded-crystal glassware.

Hypertension has also been associated with lead exposure in the general population. At the typical levels to which individuals are exposed, lead can cross the placenta and damage developing fatal nervous systems. High level exposure to lead may cause miscarriage in pregnant woman and can also damage the organs responsible for sperm production in male.

The most severe neurological effect of lead in adults is lead encephalopathy, which is a general term to describe various diseases that affect brain function. Lead exposure may cause weakness in fingers, wrists, or ankles.

Children are more sensitive to the effects of lead than adults. A child who swallows large amounts of lead may develop blood anemia, kidney damage, severe stomachache, muscle

YASHODA TECHNICAL CAMPUS SATARA
DIRECTOR
Yashoda Technical Campus
Satara

weakness, and brain damage. The lower IQ levels and other neuropsychological deficiencies among the children exposed to higher lead levels have been well documented. Lead acetate and lead phosphate have been shown to be potential carcinogens based on studies in animals.

Bioavailability is defined as the fraction of the element from an ingested matrix such as soil, water or food that can be absorbed by an organism. The bioavailability and environmental mobility of the metals are dependent upon the form in which the metal is associated with the soil.

Lead is used for production of batteries, cosmetics, metal products such as ammunitions, solder and pipes. Lead is highly toxic and hence its use in various products, such as paints, gasoline has been considerably reduced nowadays.[8]

The main sources of lead exposure are- Lead based paints, Gasoline, Cosmetics, Toys, Household, dust, Contaminated, soil, Industrial emissions etc.

Lead poisoning was considered to be a classic disease and the signs that were seen in children and adults were mainly pertaining to the central nervous system and the gastrointestinal tract. Lead poisoning can also occur from drinking water. The pipes that carry the water may be made of lead and its compounds which can contaminate the water. According to the Environmental Protection Agency (EPA), lead is considered a carcinogen. Lead has major effects on different parts of the body. Lead distribution in the body initially depends on the blood flow into various tissues and almost 95% of lead is deposited in the form of insoluble phosphate in skeletal bones.

Toxicity of lead, also called poisoning, can be either acute or chronic. Acute exposure can cause: Loss of appetite, Headache, Hypertension, Abdominal pain, Renal Dysfunction, Fatigue, Sleeplessness, Arthritis, Hallucinations and Vertigo etc.

Chronic exposure of lead can result into; Mental Retardation, Birth defects, Psychosis, Autism, Allergies, Dyslexia, Weight loss, Hyperactivity, Paralysis, Muscular Weakness, Brain Damage, Kidney damage and may even cause death.

Mechanism of lead toxicity

Lead metal causes toxicity in living cells by following ionic mechanism and that of oxidative stress. Oxidative stress in living cells is caused by the imbalance between the production of

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

free radicals and the generation of antioxidants to detoxify the reactive intermediates or to repair the resulting damage. Antioxidants, as e.g.; glutathione, present in the cell protect it from free radicals such as hydrogen peroxide. Under the influence of lead, however, the level of the ROS increase and the level of antioxidants decreases. Since glutathione exists both in reduced (GSH) and oxidized(GSSG) state, the reduced form of glutathione gives its reducing equivalents from its thiol groups of cysteine to ROS in order to make them stable. In the presence of the enzyme glutathione peroxidase, reduced glutathione readily binds with another molecule of glutathione after donating the electron and forms glutathione disulfide(GSSG). The reduced from (GSH) of glutathione accounts for 90% of the total glutathione content and the oxidized from(GSSG) accounts for 10% under normal conditions. Yet under the condition of oxidative stress, the concentration of GSSG exceeds the concentration of GSH. Another biomarker for oxidative stress is lipid peroxidation, since the free radical collects electron from lipid molecules present inside the cell membrane, which eventually causes lipid peroxidation. At very high concentrations, ROS may cause structural damage to cells, proteins, nucleic acid, membranes and lipids, resulting in a stressed situation at cellular level.

The ionic mechanism of lead toxicity occurs mainly due to the ability of lead metal ions to replace other bivalent cations like Ca, Mg, Fe and monovalent cations like Na, which ultimately disturbs the biological metabolism of the cell. The ionic mechanism of lead toxicity causes significant changes in various biological processes such as cell adhesion, intra and inter cellular signaling, protein folding, maturation, apoptosis, ionic transportation, enzyme regulation, and release of neurotransmitters. Lead can substitute calcium even in picomolar concentration affecting protein kinase C, which regulates neural excitation and memory storage.[14]

Procedure[31]

Standard

1. In a 50ml labeled Nessler's cylinder(S) Pippete 1.0ml of lead standard solution (20 ppm Pb).
2. Dilute with distilled water to 25ml.
3. Adjust the pH with dilute acetic acid or dilute ammonia solution in between 3.0 to 4.0.
4. Dilute with distilled water about 35ml and mix with glass rod.
5. Add 10ml of freshly prepared hydrogen sulphide solution.

YASHODA 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

6. Mix and dilute to 50ml with water.
7. Allow to stand for 5 minutes.

Test

1. Accurately weigh 4g of sodium chloride and add to labeled Nessler's cylinder(t).
2. Add 2ml of dilute acetic acid and mix well, then add sufficient water to produce 25ml.
3. Adjust the p^H with dilute acetic acid or dilute ammonia solution in between3.0 to 4.0.
4. Dilute with water to 35ml and mix well.
5. Add 10ml of freshly prepared hydrogen sulphide solution.
6. Mix and dilute to 50ml with water.
7. Allow to stand for 5 minutes.
8. View downwards over a white surface and compare with that of standard.

Observation: -The colour intensity produced in test solution is **less** than the colour intensity produced in standard solution.

Inference: -The given sample of Shankh-vati tablet complies the limit for heavy metals as per the Indian Pharmacopeia.

Sulfate

- White vitriol is zinc, sulfate heptahydrate. Some sulphates were known to alchemists. The vitriol salts, from the Latin vitreolum, glassy, were so-called because they were some of the first transparent crystals known.
- Green vitriol is iron, sulfate heptahydrate.
- Blue vitriol is copper, sulfate pentahydrate.
- Alum, a double sulfate of potassium and aluminium.

The sulfate anion consists of a central sulfur atom surrounded by four equivalent oxygen atoms in a tetrahedral arrangement. The symmetry is the same as that of methane. The sulfur atom is in the +6 oxidation state while the four oxygen atoms are each in the -2 state. The sulfate ion carries an overall charge of -2 and it is the conjugate base of the bisulfate ion, which is in turn the conjugate base of sulfuric acid. Organic sulfate esters, such as dimethylsulfate, are covalent compounds and esters of sulfuric acid. The tetrahedral molecular geometry of the sulfate ion is as predicted by VSEPR theory.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Sulfates are widely used by industries. Major compounds include;

- Gypsum, the natural mineral form of hydrated calcium sulfate, is used to produce plaster. About 100 million tons per year are used by the construction industry.
- Copper sulfate, a common algaecide, the more stable form is used for galvanic cells as electrolyte.
- Iron sulfate, a common form of iron in mineral supplements for humans, animals, and soil for plants.
- Magnesium sulfate(commonly known as Epsom salts), used in therapeutic baths.
- Lead sulfate, produced on both plates during the discharge of a lead-acid battery.
- Sodium Laureth Sulfate, or SLES, a common detergent in shampoo formulation.[26]

Procedure[31]

Standard

1. Take 1ml of 25% w/v solution of barium chloride in the Nessler's cylinder(S).
2. Add 1.5ml of ethanolic sulphate standard solution (10 ppm SO_4)mix and allow to stand for 1minute.
3. Add 0.15ml of 5M acetic acid.
4. Add sufficient water to produce 50ml, stir immediately with glass rod.
5. Allow to stand for 5 minutes.

Test

1. Take 1ml of 25% w/v solution of barium chloride in the labeled Nessler's cylinder (T).
2. Add 1.5ml of ethanolic sulphate standard solution (10 ppm SO_4) mix and allow to stand for 1minute.
3. Weigh accurately 1.0g of sodium bicarbonate and add to a labeled Nessler's cylinder.
4. Add 10ml distilled water, neutralize with hydrochloric acid and dilute to 15ml with distilled water.
5. Add 0.15ml of 5M acetic acid.
6. Add sufficient water to produce 50ml, stir immediately with glass rod and allow to stand for 5 minutes.
7. View transversely against a black background.
8. Compare opalescence with that of standard solution.

Observation: -The colour intensity produced in test solution is **less** as the colour intensity produced in standard solution.

Inference: -The given sample of Shankh-vati tablet complies the limit for sulphate as per the Indian Pharmacopeia.

RESULTS

1. 0.5gm of drug contains 0.025015gm of mercury, which is within limit.
2. The given sample of shankh-vati tablet complies the limit for iron.
3. The given sample of shankh-vati tablet complies the limit for heavy metals as per Indian pharmacopeia.
4. The given sample of shankh-vati tablet complies the limit for sulfate as per Indian pharmacopeia.

DISCUSSION

Shankh-vati Tablets were collected as a gift sample from Ayurvedeeya Arkashala Ltd. Satara, to determine whether the heavy metals like mercury i.e. also known as “Parad” in Ayurveda and lead is in limit or not. As we know many patients take ayurvedic medications which contains heavy metals, due to herbal plants used for preparations. We know, heavy metals have toxic and dangerous effects on human health. They produce threat to life and effects the body functions.

Determination of mercury is done by the procedure mentioned in ayurvedic pharmacopeia. Other metals are detected by limit test for heavy metals. As by results we are able to know that heavy metals are within limit in shankh-vati tablet. As all limit tests complies with standard solution.

CONCLUSION

By overall study, we concluded that Shankh-vati tablet an ayurvedic formulation contains heavy metals(mercury and lead) and other metals like (Iron and Sulfate) within limit. So, it cannot produce any toxic effects on consumer.

ACKNOWLEDGEMENT

First and foremost, I place my heartfelt gratitude to my beloved, respected guide Prof. Avinash M. Bhagwat Sir (HOD, Faculty of B. Pharmacy) for their valuable guidance.

I wish to place my exquisite thanks to our Dear Principal, Dr. V. K. Redasani Sir for providing infrastructure and facility for completion of the project work.

My special thanks to Mr. S. S. Deshpande Sir (Co-guide, Production Manager, Ayurvedeeya Arkashala Ltd. Satara) for helping us by providing relevant information about the product. I owe my special thanks to Mrs. P. N. Kulkarni Madam (QC Department, Ayurvedeeya Arkashala Ltd. Satara) for helping us regarding our issues and problems during our project work. They helped us regarding our problems all time during are project.

ABSTRACT

Today's generation of university graduates will be required to continuously update existing employability skills and obtain new skills and qualifications as a result of the rapidly changing economy market. In order to engage in a multilateral discourse on employability skills between various educational stakeholders, it is important to consider the perceptions of both recent university graduates and faculty members. Often, recent university graduates do not fully possess the types and range of skills necessary for success in the workplace. Where such skills are taught, however, students often lack the awareness to articulate the types of skills learnt or developed in the classroom. Employability skills are best developed when these skills are integrated across the curriculum. Effective teaching practices such as promoting active learning, using multiple teaching strategies and providing prompt feedback all contribute to the skills development of students and recent university graduates. Results suggest that, whilst students would accept peer assessment as an element of their course, its introduction at least should focus on the development of evaluative skills and provide support to alleviate an onerous sense of responsibility. It is concluded that, if the value of peer assessment in terms of employability skill development is accepted, then it should be adopted as regular practice on undergraduate programmes wishing to equip students with a complete repertoire of employment-relevant skills. A systematic random sampling technique was used in selecting a sample of 392 Pharmacy graduate students drawn from different 6 institutes in Satara region from the academic session (2018-19).

KEYWORDS: Employability skills, Education, Knowledge.

INTRODUCTION

The landscape of graduate recruitment has changed drastically over the last few decades. The era where candidates were hired based solely on hard technical knowledge as reflected in academic qualifications or work experience has given way to a call for graduates who wield a formidable array of the softer, people-oriented, work-related skills. Graduates' employability is one of the fiercely debated issues in the current economic climate. Rapid changes taking place in the economy create a pressure upon employers to identify and recruit graduates that possess critical employability skills relevant to current demands. The emphasis being placed on these soft skills, also known as employability skills, is associated with and reflective of the current trends in graduate recruitment. Employers expect students to have well developed employability skills, so that they can make an immediate contribution to the workplace when recruited. Employability skills term varies by country. Another term used for Employability skills were the soft skills, generic skills, core skills or essential skills.[1]

The best results seem to be achieved when employability skill training is integrated with academic and vocational skill training forming a set of five basic skills. In this way, the relevance of the five types of skills are interrelated and taught as basic to job market success something in which the learner has a level of interest. The following strategies are suggested for incorporating employability skill development concepts in the classroom.[2]

Shivpuri & Kim, pointed that employers want to hire students with the appropriate skill set for the job. These skills include communication, problem-solving, and teamwork skills. Employability skills studied were problem-solving skills, communication skills, teamwork skills, change and innovation behavior, ability to manage self, and being civic-minded.[3]

The demand for graduates to use their subject knowledge in subsequent employment is minimal, but the opportunity to utilize their employability skills is tremendous. They have suggested that graduates must not only be able to access information, but apply the information through problem solving and teamwork processes.[4]

DIRECTOR
Yashoda Technical Campus
Satara

Based their study on employability skills: communication, team-working, problem solving, literacy, numeracy, general information technology (IT), timekeeping, business awareness, customer-care, personal presentation, enthusiasm/commitment, enterprising, vocational job-seeking and advanced vocational job specific skills.[5]

Overtoom, proposed that employability skills are those basic skills necessary for getting, keeping, and doing well into job. It is a group of important skills instilled in each individual in order to produce productive workforce. This is parallel with individuals who have strong characteristics such as a high sense of self, innovative, productive, skilful, and competitive, a strong sense of determination, and creative in facing the challenges of the national as well as global platforms. Besides that, employability skill is also crucial in all professions as well as in education. The Conference Board 1996 defined employability skills as individual quality required by the employer which can be applied in various fields of work.[6]

Khaled Nordin proposed that changes in the industrial sector require educational institutions to provide graduates with employability skills Technical and vocational education systems need to plan strategies to improve the quality of graduates in order to meet the current needs of employers.[7]

The two greatest concerns of employers/recruiters today are finding good employees and training them. It is observed that there lies a difference between the skills needed on the job and those possessed by applicants called the skills-gap, which is of real concern to human resource managers and business owners looking to hire competent skillful employees. While employers would prefer to hire people who are trained and ready to go to work, they are usually willing to provide the specialized, job specific training necessary for those lacking such skills. Employability has become a far bigger challenge than unemployment, probably because there are still large vacancies in industries but lack of employable candidates.[8]

The technical and management education system in the country has grown extremely. While on the one side we say that we have the world‘s largest stock of engineers, scientists and management graduates, we have not been able to derive full economic benefit from this talent base probably because of the mismatch between industrial needs and educational output. It also seems that students often undervalue the need to possess transferable skills. Instead, they deem that mastery of disciplinary content is more important than transferable skills to employers. Though, employers desire graduates who can think and work on their feet and determine ways to accomplish tasks.[9]

Today, employers in every industrial sector stress the need for employees with certain set of foundational skills. These include a strong academic grounding along with individual abilities such as teamwork, problem solving, work ethic and integrity. While employers rely on employees to have the same basic skills, they do not always talk about or label them the same way. This makes it difficult for prospective employees and educators to know exactly what it takes to be ready to succeed in any career path in any industry.[10] Employability skills are therefore valued as they apply to many jobs and so can support common preparation to meet the needs of many different professions.[11]

It also refers to those skills required to acquire and retain a job. These transferable skills include the ability to solve complex multidisciplinary problems, work successfully in teams, exhibit effective oral and written communication skills, and practice good interpersonal skills.[12]

The lack of adequate skills and high attrition rates has a huge impact in terms of India‘s ability to absorb new technologies and new solutions. So there seems to be need for a fundamental shift toward an emphasis on general skills in education because the skills most in demand are least in supply.[13]

In recent practice today this term employability skills is often used to describe the preparation skills upon which an applicant student must build job specific skills which relate to communication, personal and interpersonal relationships, problem solving, and management of organizational processes.[14]

The National Association of College and Employers 2014, have compiled a list of the top 18 skills requested by employers. These skills in rank order are as follows: (1) Communication skills (2) Leadership (3) Analytical/quantitative skills; (4) Strong work ethic (5) Teamwork skills (6) Problem solving skills (7) Initiative (8) Detail-oriented (9) Computer skills (10) Technical skills (11) Flexibility/adaptability (12) Interpersonal skills (13) Organizational ability (14) Strategic planning skills (15) Friendly/outgoing personality (16) Entrepreneurial skills/risk-taker (17) Tactfulness and (18) Creativity. These skills are considered to be important for potential employees to possess and apply to their job.[15]

Purpose of study

1. To identify the new ways to improve the skills in the course of higher education
2. To assess skill gap of management students that are developed in academic with regards to the level of expectation of the industry.
3. To identify the employability skills, which are classified into three groups - Person to Person, Person to Vocation and Person to Job.

DIRECTOR
Yashoda Technical Campus
Satara

Significance of the Study

The findings will enable the students to take necessary actions to plan their career and know and reinforce the employability skills. Similarly the institutes will be able to plan for value addition to their students to make them more employable. The results of this research work will no doubt be of great importance to all stakeholders that includes the researchers, students, Institutes and employers. This study will equally form useful reference materials to both the researchers and students.

METHODOLOGY

This study used a descriptive research design with quantitative approached. This study aims to identify the importance of employability skills. Survey research design method was used for the study, which involves the collection of information from a sample of individuals through their responses to predetermined questions. Survey design was chosen for this study as it is supposed to be the most appropriate for gathering first hand information on students employability skills and opportunities, without changing or modifying the situation under investigation. No cause-and-effect relationship was sought.

A systematic random sampling technique was used in selecting a sample of 392 Pharmacy graduate students drawn from different 6 institutes in Satara region from the academic session (2018-19). A structured questionnaire titled study on Pharmacy Graduate students Employability was used for collection of data. The test-retest method of reliability was used.

RESULTS

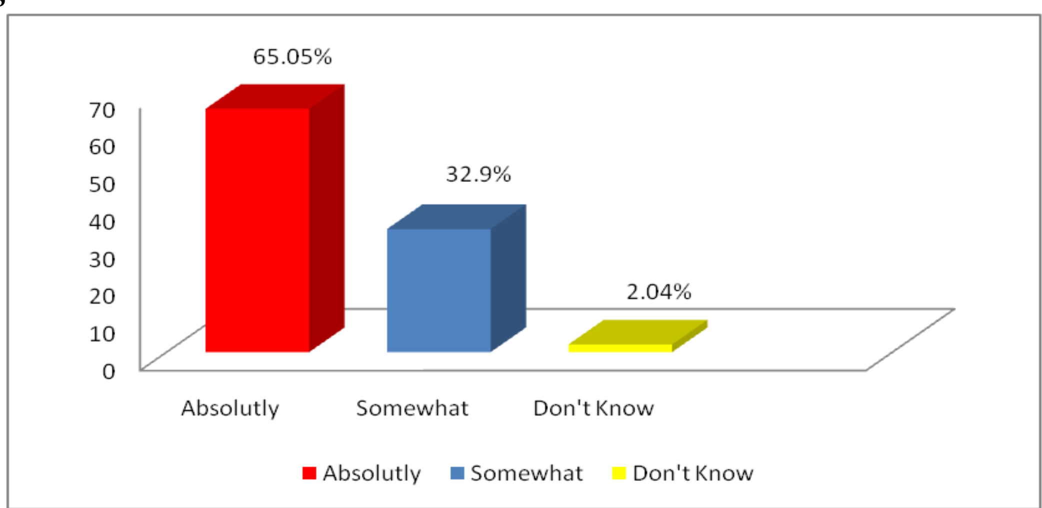

Figure 1: Career Objective.

Figure 1:- The survey conducted for the above study revealed that almost 65.05% candidates were absolutely aware about their own career, whereas around 32.9% were not much clear about their own career objectives and 2.04% were not at all aware about their own career objective.

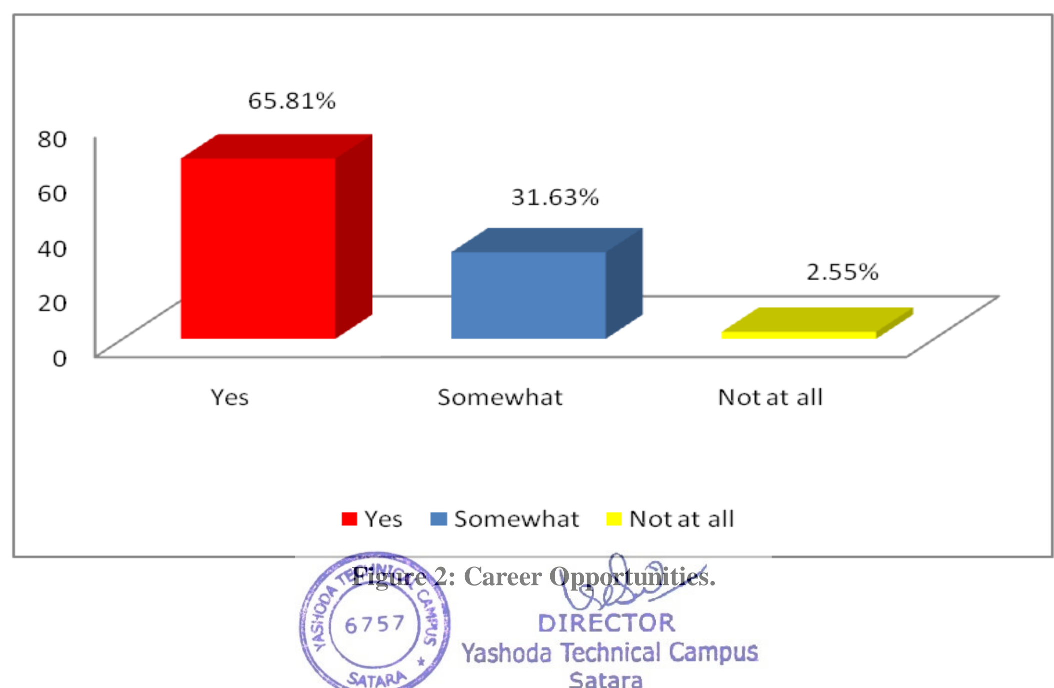

Figure 2: Career Opportunities.

6757 YASHODA TECHNICAL CAMPUS SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Figure 2:- Depicts that 65.81% respondents were aware about the career opportunities available in the field, but nearly 31.63% were not fully aware about such opportunities 2.55% were not at all aware about their own career opportunities.

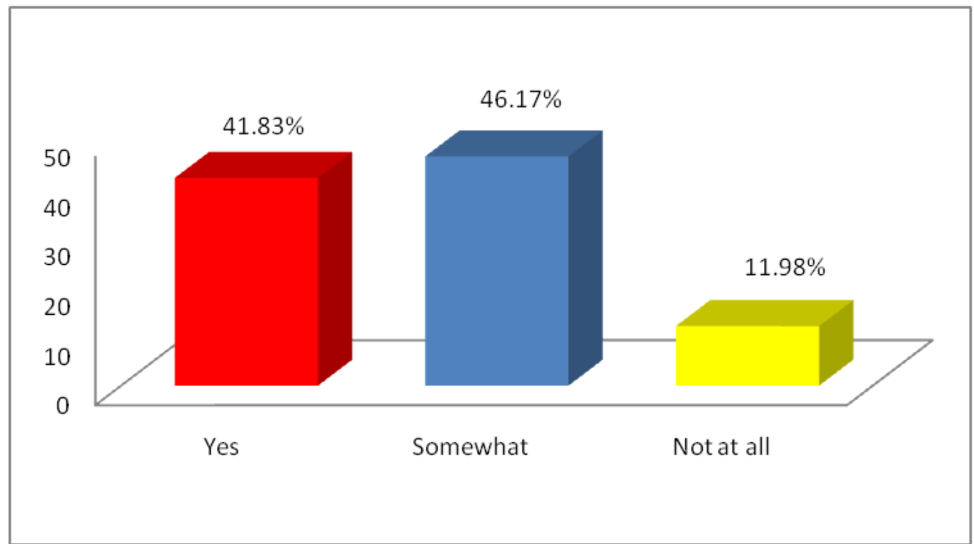

Figure 3: Course content Updation.

Figure 3:- reveals that only 41.83% respondents think that their course content is updated with the current industrial requirement whereas around 46.17% candidates believe that their syllabus is not completely updated with the current industrial requirement and 11.98% believe that it is not at all updated with current industrial requirement. It has also been found that some private universities who update their syllabus regularly do not face such problem and that increases the chances of opportunity for their students.

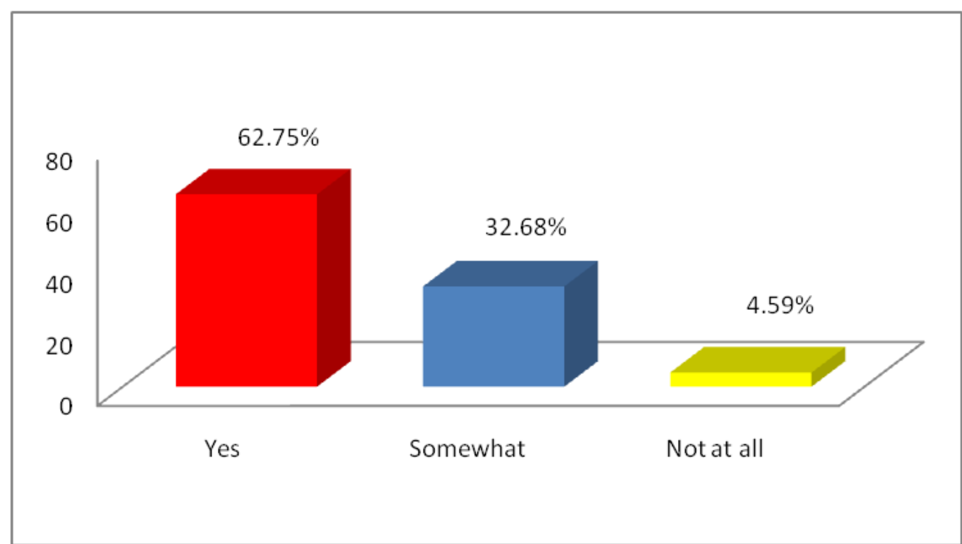

Figure 4: Advantage of Extra Curricular.

Figure 4:- Depicts that 62.75% respondents believed that participation in extracurricular activities during college definitely/surely adds an advantage during recruitment process whereas 32.68% think that it is less advantageous and 4.59% were not at all advantagous about extra-curricular.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

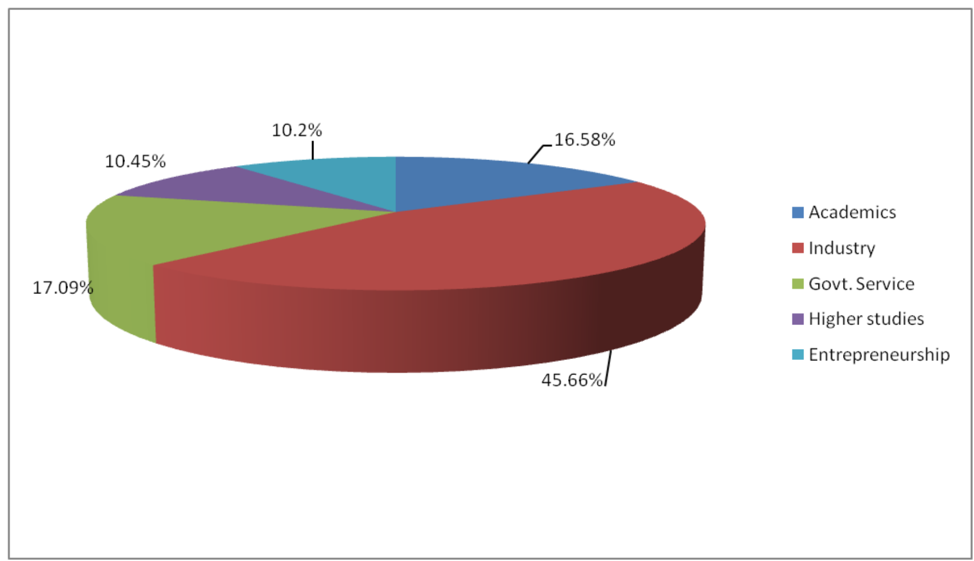

Figure 5: Career preference.

Figure 5:- Reveals that 45.66% of the candidates preferred to make their career in industry followed by government services 17.09% and few preferred to join academics 16.98%. And very few preferred to go for higher studies and start their own business as an entrepreneur. This shows that majority of population is interested to do their career in industry where as they are not equipped with the current industrial requirement could be one of the reason for unemployment.

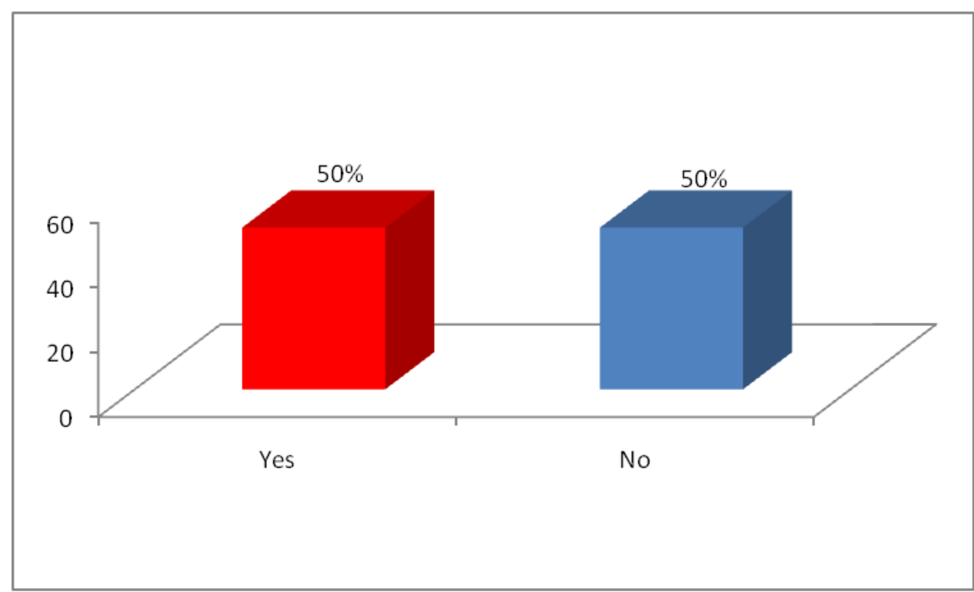

Figure 6: Sufficiency of Possessing only Degree.

Figure 6:- Reveals that 50% of candidates strongly believe that only possessing a degree is not sufficient for securing good opportunity in the industry and believed that some additional skills are surely required along with the degree to convert a good opportunity into a job. But most of the candidates were not sure about the exact set of additional skills required for the same.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

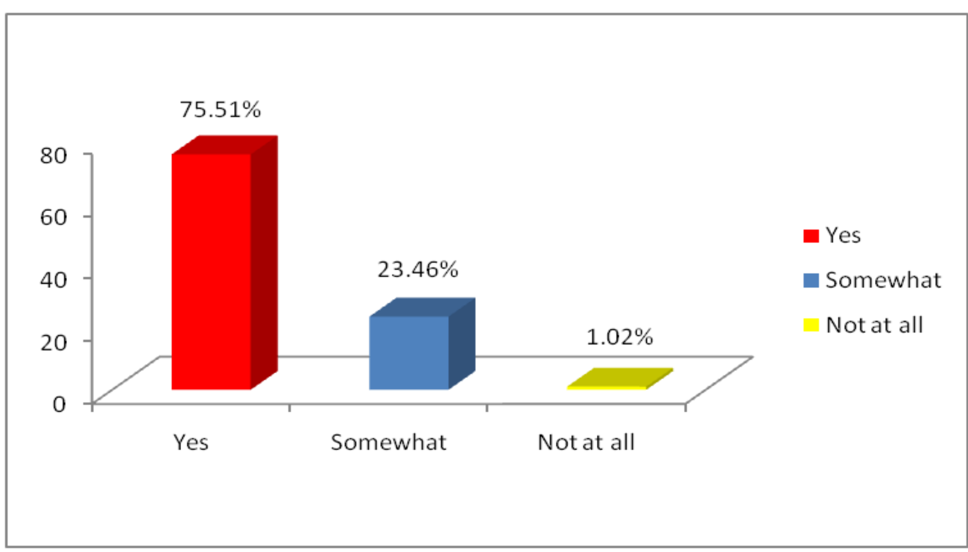

Figure 7: Acquiring Additional Skills.

Figure 7:- Depicts that around 75.51% respondents agreed to and tried to acquire such additional skills which they think is essential, whereas remaining 23.46% tried something for skills and there is 1.02% are not at all seriously to acquire such additional skills.

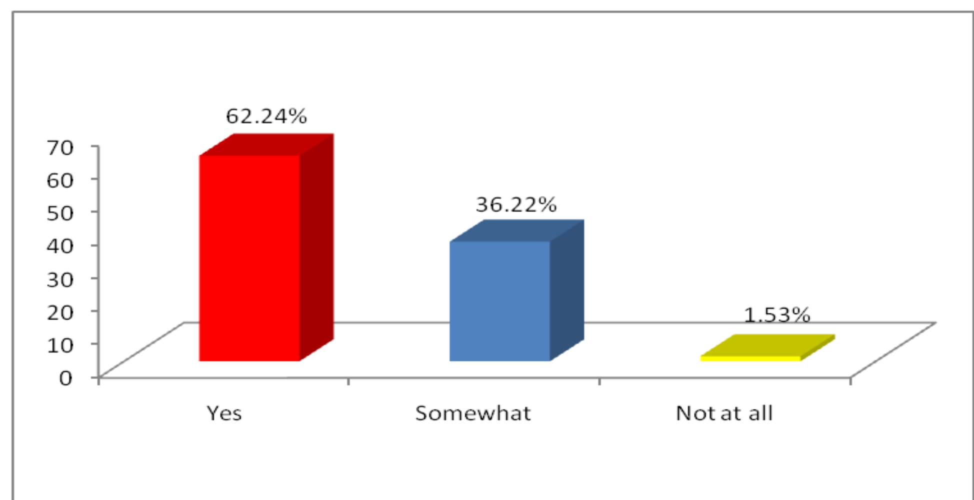

Figure 8: Awareness about Employability Skills.

Figure 8 reveals that only 62.24% respondents were well aware about the employability skills whereas 36.22% were little aware and 1.53% were totally unaware about the concept of employability skills. But when they were made aware about the concept of employability skills, more than 95% agreed that these skills are most and absolutely essential for securing a good job in the today‘s competitive world.

Table 1: Responses for the different employability skills.

Sr. No.	Employability skills	Excellent (%)	Good (%)	Poor (%)
1	Communication Skills	46.60	54.84	2.55
2	Teamwork Skills	42.34	56.63	1.02
3	Problem Solving Skills	35.96	59.18	2.55
4	Initiative & Enterprise Skills	31.12	65.30	3.57
5	Planning & Organizing Skills	36.22	60.20	1.02
6	Learning Skills	39.79	53.06	2.29
7	Technology Skills	33.92	54.84	2.55
8	Self Management Skills	40.56	56.63	2.80
9	Personal Attribute skills	43.11	54.08	2.80

6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Table 1:- The responses of the candidates regarding awareness about nine different employability skills identified. It reveals that majority of these skills, the candidates were only aware of and therefore required to analyze and acquire such skills to increase their employability. Out of the nine set of skills identified students have mainly concentrated on communication and technology skills and less on the other skills which might be the reason for generation of qualified but less skillful candidates required today by the corporate.

Table 2: Responses for the different activities undertaken to increase employability skills.

Sr. No.	Activities	Yes (%)	No (%)
1	Prepared/updated my CV	71.42	28.57
2	Sought advice on how to write a CV	67.34	32.65
3	Found out what skills/qualities employers are looking for	76.53	23.46
4	Kept record of my personal development and achievements	77.04	22.95
5	Did some research on careers I am interested in	72.19	27.80
6	Visited a careers/job fairs	65.81	34.18
7	Undergone any careers module/course	70.66	29.33
8	Attended any Short term courses/ seminars/conference	75	25
9	Worked on enhancing communication skills	75	25
10	Tried to communicate with employers by sending resumes	59.69	40.30
11	Worked part time to get additional experience	58.92	41.07
12	Took advise of counselor	67.85	32.14
13	Used internet to get important information of the field	100	0

Table 2:- The responses of the candidates regarding the various activities undertaken by them to enhance their awareness to increase their chances of employment. It reveals that most of the identified activities were undertaken by the students (some knowingly and some unknowingly) but with a less serious note probably due to lack of awareness about existence of such employability skills and therefore it is required to be taken seriously to make them more employable.

CONCLUSION

The concept of employability skills has increasingly become the concern of stakeholders like industries, employers, education institutes and indeed almost all the students. It largely includes student's skills and potentials for obtaining and succeeding in a job apart from their routine academic knowledge and skills. From the present examination we can along these lines presume that just specialized information (Degree) isn't adequate for verifying a great job, yet understudies should focus on increasing the value of their profile as some arrangement of aptitudes currently called as employability abilities required by the businesses in their field to make them progressively employable. The study also concludes that in the competitive age students should voluntarily try to identify and acquire these skills along with their course to make them more employable. The institutes should also create an environment that will assist the students to boost their employability skills by conducting mocks, seminars, workshops, in-house skill improvement programme etc. With Industry's increasing demand for skilled rather than qualified talent; it is important to understand the needs of demand side better and take combined efforts by all the stakeholders at large.

This investigation has featured the significance of employability abilities of the understudies for better business opportunity. It will likewise help in distinguishing the difficulties that should be survived if more understudies are to grasp the potential advantages by securing these aptitudes.

So it could be recommended that students during their graduation should try to identify the employability skills required in the pharmaceutical field or their field of interest and work on it to make themselves potent employable candidates. Understudies likewise do some specialized extra course to improve their particular aptitudes sets.

ACKNOWLEDGEMENT

I express my deep gratitude and indebtedness to Mr. Avinash M. Bhagwat (Project Guide and HOD of B. Pharmacy, YSPM's YTC Faculty of Pharmacy, Satara.) for his valuable guidance throughout the course of this project.

I wish my sincere thanks to Principals and staff of following colleges for their help and cooperation:

The aim of present work was to develop carboxymethylcellulose (CMC)-polyvinyl alcohol (PVA) hydrogel films for extended delivery of water soluble basic drug, using citric acid (CA) as a cheap and non-toxic crosslinking agent. Gentamicin sulfate (GTM) was used as a model drug. The hydrogel films were evaluated for carboxyl content, tensile strength, swellability, drug loading and release, hemocompatibility and characterized by ^{13}C-CP-MAS NMR, ATR-FTIR and thermal analysis (TGA and DSC). The instrumental analysis helped to confirm the formation of ester crosslinks. CMC-PVA hydrogel films exhibited greater carboxyl content, tensile strength and swellability than the pure CMC hydrogel films. The GTM loading increased with an increase in the amount of PVA in the hydrogel films. The CMC-PVA hydrogel films showed propensity to extend the release of GTM above 24 h. Hemolysis assay revealed the hemocompatible nature of the hydrogel films. Altogether, the CMC-PVA hydrogel films can be envisioned as promising biomaterial for the delivery of water soluble basic drugs.

1. Introduction

Hydrogels are the crosslinked polymeric network structures capable of absorbing large amount of water without dissolving in it. Due to their rubbery consistency and water retention capacity which resembles natural tissues, hydrogels are mostly used in the field of biomedical and pharmaceutical sciences [1]. The hydrogels can be prepared from synthetic or natural polymers using physical, chemical or radiation crosslinking. The hydrogels prepared using synthetic polymers exhibit good mechanical properties; however, most of them do not support cell adhesion and tissue formation. On the other side, natural polymer based hydrogels are biocompatible, biodegradable and support cellular activities [2]. In recent years, extensive research has been carried out to develop hydrogel-based drug delivery systems using natural polymers [3–9]. Amongst the natural and semi-synthetic polymers, cellulose and its water soluble derivatives are mostly preferred because of the abundance of cellulose on earth and relatively low cost of the cellulose derivatives than the synthetic polymers [10].

Carboxymethylcellulose (CMC) is highly hydrophilic cellulose derivate [11,12]. It is widely used as thickening and suspending agent in the food and pharmaceutical industry. The scientists dealing with the hydrogels for drug delivery are interested in CMC due to its good swellability, non-toxicity and modifiability [13]. Large number of reports are available on the preparation of CMC-based hydrogels for the delivery of water soluble drugs [14–17]. In most of these cases, the crosslinking agents used are either expensive or toxic [18]. In last few years, citric acid (CA) has emerged as a non-toxic and cheap crosslinking agent. At high temperatures, it esterifies the hydroxyl groups present on the nearby polymer chains and forms the crosslink. For preparation of CA crosslinked hydrogels of alone CMC, excess of CA is required as CMC shows poor crosslinking due to electrostatic repulsion in between the carboxylate ions present on the adjacent polymer chains. This leads to the formation of intramolecular crosslinks. Therefore, Demitri and co-workers (2008) fabricated CA crosslinked superabsorbent hydrogels by combining CMC with hydroxyethylcellulose (HEC) for improving the intermolecular crosslinking [19]. These hydrogels were intended for agricultural application. The hydroxyl groups attached to the oxyethylene chains in HEC are highly reactive and hence, can readily undergo esterification reaction with CA and facilitate the formation of CMC hydrogels with good integrity. Very few works are reported on the use of CA crosslinked CMC based hydrogels in drug delivery. Mali et al. (2018) have prepared hydrogel films comprised of CMC and tamarind gum (TG) for delivery of moxifloxacin HCl. Furthermore, we have prepared CMC-polyethylene glycol

(PEG) hydrogel films for the improvement of loading and extended release of hydrophobic drugs [20].

Polyvinylalcohol (PVA) is a synthetic polymer which is biocompatible, biodegradable and widely used in pharmaceutical, bio-medical and food sectors [21]. The large number of reactive hydroxyl groups present on the polymer chain of PVA makes it suitable for the synthesis of hydrogels, mostly by physical [22–24] or chemical [25–28] crosslinking. The CA crosslinked PVA films have been prepared for antimicrobial packaging purpose [29]. Taking this into consideration, PVA can be used as a better alternative to HEC while preparing CMC hydrogels since the amount of PVA required for the formation of intact hydrogels will be less. In previous studies, CMC-PVA hydrogels have been prepared for drug delivery [30–32]; however, CA crosslinked CMC-PVA hydrogels have not been investigated for their ability to control the drug release.

The present work deals with the preparation of CMC-PVA hydrogel films using CA as crosslinking agent, for the delivery of water soluble basic drugs. Our objective was to develop the inexpensive hydrogels with good drug loading efficiency and ability to control the release of water soluble drugs, so that they can be used as implants or wound dressings. As the crosslinks consist of COOH branching which usually ionize at physiological pH, the prepared hydrogel films could be more favorable for the delivery of basic drugs. Along with an improvement in the extent of crosslinking, the large number of OH groups on PVA chains may also contribute towards the enhancement of swellability of the CMC-PVA hydrogel films. Also, the OH groups of PVA and COOH groups of CA crosslinks may hold the weakly basic drug molecules (pKa > physiological pH) within the hydrogel matrix by hydrogen bonding and electrostatic interactions. Taking these aspects into account, we hypothesize that the CA crosslinked CMC-PVA hydrogel films may enhance the loading as well as control the release of water soluble basic drug.

The hydrogel films were suitably characterized to confirm the formation of ester crosslinks. The films were loaded with gentamicin sulfate (GTM, model water soluble basic drug) and evaluated for drug release. Hemolysis assay was performed to test the hemocompatibility of the hydrogel films.

2. Materials and methods

2.1. Materials

Gentamicin sulfate (GTM) was obtained as a gift sample from RP Pharma, Mumbai, Maharashtra (India), sodium carboxymethylcellulose (CMC, degree of substitution: 0.7, average molecular weight: ~250000) was purchased from Sigma Aldrich, Mumbai, Maharashtra (India), polyvinyl alcohol (PVA, MW: 115,000 Da, Hydrolysis: 98–99%) and citric acid (CA) were purchased from Loba Chemie, Mumbai, Maharashtra (India). All other chemicals were of analytical grade and used as received.

2.2. Preparation of CMC-PVA hydrogel films

The CMC-PVA hydrogel films were prepared by modifying the previously reported method [20]. Initially, a suitable amount of PVA was dissolved in distilled water by heating on a water bath at 80 °C for 20 min, under reflux. The obtained PVA solution was cooled to room temperature followed by addition of CMC and CA (% of polymer amount). This mixture was stirred on a magnetic stirrer to obtain a homogenous solution and placed overnight in a closed compartment in order to remove the air bubbles. The clear solution was poured into the petri dish of specific diameter (9 cm) and dried in the hot air oven at 50 °C for 24 h. The dried CMC-PVA-CA film was cured at 145 °C for 5 min, to promote the crosslinking reaction in between the polymer chains. The cured film was washed with distilled water in cycles until the pH of water became nearly neutral. Finally, the swollen film was washed with isopropyl alcohol to remove the water entrapped within the matrix. The shrunken film so obtained was dried in the hot air oven at 40 °C for 24 h and stored in a desiccator. The concentration of PVA was varied in order to study their effect on the film properties (see Table 1).

Table 1
CMC-PVA hydrogel films containing different concentrations of PVA.

Batch	CMC (%w/v)	PVA (%w/v)	CA (%)[a]
HF0	2	0	20
HF0.5	2	0.1	20
HF1	2	0.2	20
HF2	2	0.4	20
HF3	2	0.6	20

[a] Indicates % of the polymer amount.

2.3. Determination of carboxyl content

The total carboxyl content of hydrogel films was determined by acid-base titration [33,34]. CO_2 free water was used for the preparation of titrant (0.1 N HCl) and analyte (0.1 N NaOH). A specific amount of hydrogel film was added to the adequate volume of 0.1 N NaOH and stirred on a magnetic stirrer for 2 h. The hydrogel films disintegrated and dissolved completely due to sodium hydroxide aided breaking of the ester crosslinks. Also, sodium hydroxide reacts with the free carboxylic acid groups to form sodium citrate. The excess amount of 0.1 N NaOH was titrated with 0.1 N HC1 using phenolphthalein indicator. The carboxyl content in milliequivalents per 100 g of hydrogel film was determined using following formula:

$$Total\ carboxyl\ content\ (mEq/100g) = \frac{(V_b - V_a) \times N_{HCl} \times 100}{W_{HF}} \quad (1)$$

where, N_{HCl} is the normality of HCl (mEq/mL), V_b and V_a are the volumes of HCl in absence and presence of hydrogel film, and W_{HF} is the weight of hydrogel sample (g).

2.4. Characterization of hydrogel films

Solid state ^{13}C cross-polarization-magic angle spinning (^{13}C CP-MAS) NMR spectra of CMC, PVA, CA and CMC-PVA hydrogel film (HF3) was recorded using JEOL-ECX400 spectrometer operated at 400 MHz, with a spinning speed of 10 KHz. The contact time, relaxation delay and sweep width were fixed at 3.5 ms, 5 s and 35 kHz, respectively. The external hexamethylbenzene standard methyl resonance at 17.3 ppm was used for the calibration of chemical shifts.

The infrared spectra of CMC, PVA, CA and hydrogel films were obtained using ATR-FTIR spectrophotometer (MIRacle-10, IR Affinity-1, Shimadzu, Japan). The samples were transferred to the ATR compartment and spectra were obtained in the range of 400–4000 cm^{-1} (scans = 25; resolution = 4 cm^{-1}).

CMC, PVA and hydrogel films (HF0 and HF3) were subjected to the thermal analysis (TGA and DSC) using SDT Q600 V20.9 Build 20 (TA instruments, Water, USA). Samples (approx. 5 mg) were taken in the sample pan and were heated from 30°C to 300 °C, at the heating rate of 10 °C/min, under nitrogen atmosphere (purge rate = 10 mL/min).

2.5. Determination of tensile strength

The tensile strength of the hydrogel films was tested using Texture Analyzer (CT 3-10,000, Brookfield, WI) [35,36]. The analyzer was fitted with a 10 kg load cell. Each film was cut into 2 cm × 1 cm size and clamped on probe TA-DGA (hold time = 60 s). Holding the lower clamp stationary, the hydrogel film was pulled apart with the help of upper clamp with a speed of 2 mm/s to a distance of 6 mm (trigger load = 0.05 N). The force at which the film broke was recorded and the

DIRECTOR Yashoda Technical Campus Satara

tensile strength of the hydrogel films was determined as given below.

$$Tensile\ strength\ (kg/mm^2) = \frac{Force\ at\ break}{Initial\ cross-sectional\ area} \quad (2)$$

2.6. Determination of swelling behavior

The swelling behavior of the hydrogel films was studied in phosphate buffer (pH 7.4) at 37 °C. The hydrogel films (~0.2 g) were immersed in the beaker containing 20 mL buffer. After 30 min, swollen film samples were removed from the buffer and their surface was blotted with tissue paper to remove the excess water followed by weighing on the analytical balance (Shimadzu, AX 120). The hydrogel films were reimmersed in the buffer and the procedure was repeated at specific time intervals till 24 h. The swelling ratio of the hydrogel films was determined by using eq. no. (3).

$$Swelling\ ratio\ (g/g) = \frac{W_s - W_d}{W_d} \quad (3)$$

where, W_s is the weight of swollen hydrogel film and W_d is the weight of dry hydrogel film. The measurements were taken in triplicate [3,37].

2.7. GTM loading

In order to load GTM into the hydrogel films, the preweighed films (~100 mg) were allowed to swell in the aqueous GTM solution (10 mg/mL) till equilibrium. The swollen hydrogel films were dried at room temperature for 24 h. In order to determine the amount of GTM loaded in the hydrogel films, they were initially cut into fine pieces. The specific amount of these pieces were added to 50 mL phosphate buffer (pH 7.4) and stirred for 48 h. Thereafter, the amount of GTM released in the buffer was determined using colorimetric estimation as GTM shows negligible UV absorbance [38]. Briefly, standard solutions of GTM (5–9 μg/mL) were prepared in phosphate buffer (pH: 7.4). One mL of these solutions was taken in the 10 mL volumetric flasks followed by addition of 0.5 mL of 2 M H_2SO_4 and 2 mL of 5×10^{-4} M $KMnO_4$ solutions. The obtained mixtures in the flasks were heated on the water bath for 25 min, cooled to room temperature and 2.5 mL of 5×10^{-4} M methylene blue was added to the respective flasks. The volume was adjusted to 10 mL with buffer and the mixtures were subjected to spectrophotometric analysis (UV1800, Shimadzu, Japan) at 664 nm. The calibration curve so obtained was used further for determination of GTM released in the buffer [39].

2.8. In vitro GTM release

The in vitro drug release study was performed by modifying the previously reported methods [40,41]. The GTM loaded hydrogel films of known weight were placed in screw-capped vials containing 10 mL of phosphate buffer (pH: 7.4). These vials were kept in the constant temperature bath (without agitation) at 37 °C. At specific time intervals, aliquots were withdrawn and suitably diluted followed by spectrophotometric analysis (UV1800, Shimadzu, Japan) using colorimetric method as described above. All the measurements were taken in triplicate.

2.9. Hemocompatibility study

Recently, biocompatibility of natural polymer based biomaterials was tested by few authors using hemolysis assay [5,7,9]. As the CMC-PVA hydrogel films can be used as implants or wound dressings, they were examined for hemocompatibility using hemolysis assay with slight modification [42]. The hydrogel films were cut in order to get surface area of 2 cm^2. These films were allowed to swell in the phosphate buffer saline (PBS) maintained at 37 °C for 1 h. Thereafter, PBS was removed and 0.5 mL of human CPD (citrate-phosphate-dextrose) blood was added over the films. After 20 min, the hemolysis process was stopped by addition of 4 mL, 0.9% NaCl saline followed by incubation of the samples for 1 h at 37 °C. The incubated samples were centrifuged at 4000 rpm for 10 min and the supernatant was subjected to spectrophotometric analysis (UV1800, Shimadzu, Japan) at 545 nm. The hemolysis (%) was determined using following formula:

$$Hemolysis\ (\%) = \left(\frac{A_{Test\ sample} - A_{-ve\ control}}{A_{+ve\ control} - A_{-ve\ control}}\right) \times 100 \quad (5)$$

where, A = absorbance.

+ve control = mixture of 0.5 mL, human CPD blood and 4 mL double distilled water

- ve control = mixture of 0.5 mL, 0.9% NaCl saline and 4 mL double distilled water

2.10. Statistical analysis

The experimental data were compared by one-way analysis of variance (ANOVA) using GraphPad Prism 5.01 software. The statistical significance was considered at $p < 0.05$.

3. Results and discussion

3.1. Formation of CMC-PVA hydrogel films

The CMC-PVA hydrogel films were obtained by esterification-crosslinking mechanism. At high temperatures, CA gets converted into an anhydride which esterifies the OH groups of CMC and PVA. This leads to the formation of ester crosslinks in between the polymer chains. Fig. 1 displays the possible reaction involved in the formation of CMC-PVA hydrogel films. Besides CMC-PVA crosslinks, there may be presence of CMC-CMC and PVA-PVA crosslinks in the hydrogel matrix. The concentration of CA, curing temperature and curing time required for the formation of the hydrogel films was decided on the basis of preliminary studies. The minimum concentration of CA needed for the formation of hydrogel film with good matrix integrity was 20%. On increasing the CA concentration above 20%, the hydrogels exhibited poor swellability. Although the previous reports indicate the formation of hydroxyl acid crosslinked cellulose-based hydrogels at the curing temperature of 80 °C, the time required for the curing was more (> 10 h) [19,43]. In the preliminary studies, we found that the curing temperature of 145 °C and curing time of 5 min was sufficient to obtain the hydrogel films with desired swellability and integrity. However, increasing the curing temperature and curing time above 145 °C and 5 min led to the development of yellowish color on the films, possibly due to thermal decomposition. The obtained hydrogel films showed an average thickness in the range of ~130–135 μm.

3.2. Total carboxyl content

Table 2 represents the total carboxyl content of the CMC-PVA hydrogel films. It was observed that an increase in the amount of PVA up to 0.2% increased the carboxyl content of the hydrogel films. In case of CMC hydrogel film (HF0), the carboxyl content was found to be less as compared to the CMC-PVA hydrogel films. This indicates that CMC hydrogel film showed minimum number of interpolymer crosslinks than the CMC-PVA hydrogel films. This can be attributed to the degree of substitution (DS) of CMC i.e. 0.7 and weak electrostatic repulsion in between the adjacent CMC chains due to presence of few COO^- groups in the feed of HF0. The DS equivalent to 0.7 suggests that very few primary hydroxyl groups (C6-OH) are available on CMC for taking part in the esterification reaction. On the other hand, the weak electrostatic repulsion in between the adjacent CMC chains may inhibit the CA from linking them. As a result, most of the CA may remain unutilized. PVA

DIRECTOR Yashoda Technical Campus Satara

Fig. 1. Reaction involved in the formation of CMC-PVA hydrogel films.

consists of large number of secondary hydroxyl groups which are highly reactive [44]. These hydroxyl groups can readily participate in the esterification reaction. On inclusion of PVA in the feed, the CA which was unutilized in case of CMC hydrogels will get involved in the formation of CMC-PVA and PVA-PVA crosslinks. This may be the reason behind increase in the carboxyl content of HF0.5 and HF1. However, further increase in the amount of PVA (HF2 and HF3) led to decrease in the carboxyl content possibly due to decrease in the crosslinking density of the hydrogel films caused by dilution effect. In case of batch HF1 (0.2% PVA), there might be a possibility of maximum consumption of the citric acid in the formation of crosslinks. As a result, further increase in the concentration of PVA may increase the distance in between the adjacent crosslinks within the hydrogel films and reduce the crosslinking density. Another reason behind decrease in the crosslinking density on increasing the concentration of PVA beyond 0.2% may be insufficient physical interactions in between CMC and PVA at high concentrations of PVA. HF3 containing high amount of PVA showed low carboxyl content than HF1 and HF2 but it was greater than HF0.

Table 2
Total carboxyl content (TCC), tensile strength (TS), equilibrium swelling ratio (ESR), GTM loading and hemolytic activity of the CMC-PVA hydrogel films.

Batch	TCC (mEq/100 g)	TS (kg/mm^2)	ESR (g/g)	GTM loading[a]	Hemolysis (%)
HF0	229.55	3.13 ± 0.16	50.51 ± 3.63	137.51 ± 1.56	4.15 ± 0.22
HF0.5	391.20	3.38 ± 0.09	53.55 ± 2.75	162.24 ± 2.12	4.52 ± 0.83
HF1	417.35	3.54 ± 0.12	59.75 ± 1.90	190.40 ± 1.04	4.02 ± 0.71
HF2	372.81	3.49 ± 0.05	66.42 ± 1.88	204.22 ± 2.13	3.87 ± 0.54

DIRECTOR
Yashoda Technical Campus
Satara

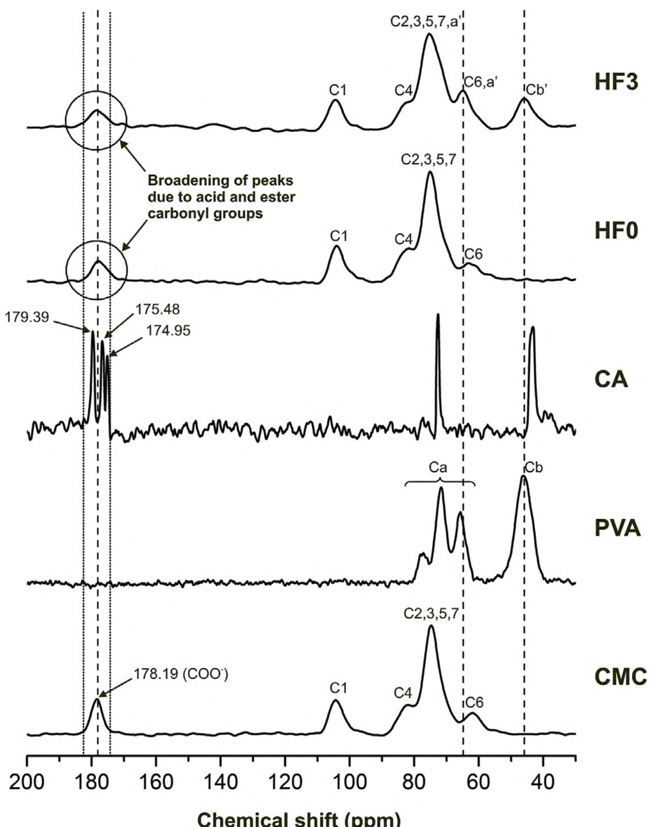

Fig. 2. Solid state ^{13}C-NMR of CMC, PVA, CA, HF0 and HF3.

3.3. Solid state ^{13}C-NMR analysis

The solid state ^{13}C-NMR spectrum of CMC, PVA, CA, CMC hydrogel film (HF0) and CMC-PVA hydrogel film (HF3) is shown in Fig. 2. The symbolic representation of various carbon atoms of CMC and PVA is indicated in Fig. 1. The carbon atoms of CMC showed a signals in the region 56-66(C6), 68-80(C2,3,5,7), 81-89(C4), 98-109(C1) and 175-183(COO$^-$) ppm. The resonance peaks corresponding to the carbon atoms of PVA appeared at 46.16 ppm (Cb) and in the range of 60–80 ppm (Ca). The carbonyl carbons of citric acid showed sharp signals at 174.95, 175.48 and 179.39 ppm. The spectrum of CMC-PVA hydrogel film (HF3) showed existence of new peaks at 45.90 and 64.70 ppm which represent the peaks of PVA (Cb at 46.16 ppm and Ca at 65.64 ppm). These peaks were absent in the spectrum of pure CMC and CMC hydrogel film (HF0). The remaining peaks of PVA were not visible in the spectrum of HF3 because they overlapped with the peaks of carbons belonging to the anhydroglucose units of CMC. Besides, the sharp carboxylate carbon peak of CMC at 178.19 ppm was found to be slightly broadened towards up-field region in the spectrum of HF0 and HF3. This clearly indicates the presence of ester crosslinks in the hydrogel films.

3.4. ATR-FTIR analysis

The presence of ester crosslinks in the CMC-PVA hydrogel films was further confirmed from ATR-FTIR analysis. Fig. 3a depicts the ATR-FTIR spectra of CMC, PVA and CA, whereas spectra of hydrogel films (HF0-HF3) are presented in Fig. 3b. The spectrum of CMC showed the characteristics peaks at 3450 cm^{-1} (O-H stretching), 2920.52 cm^{-1} (C-H stretching), 1584 cm^{-1} (C=O stretching) and 1051 cm^{-1} (C-O stretching). In the spectrum of PVA, broad band was observed at 3257 cm^{-1} corresponding to O-H stretching and sharp peaks at 2929 cm^{-1} represented C-H stretching. The peaks of PVA at 1427 cm^{-1}, 1327 cm^{-1} and 839 cm^{-1} were related to the C-H bending whereas the prominent peak at 1082 cm^{-1} represented C-O stretching. The distinct IR peaks of CA were observed at 3498 cm^{-1} and 3283 cm^{-1} (O-H stretching), 1693 cm^{-1} (C=O stretching), 1199 cm^{-1} (C-O stretching) and 786 cm^{-1} (C-C stretching).

The spectrum of HF0 showed peak at 1722 cm^{-1} corresponding to the ester as well as carboxylic acid carbonyl stretching. This indicates the presence of ester crosslinks in the CMC hydrogel film (see Fig. 3b). The changes in the carbonyl peak of the hydrogel films on addition of PVA can be clearly observed in Fig. 3c. The intensity of this peak was found to be increased as we move from HF0 to HF1, which suggests an increase in the carboxyl content and hence, the extent of crosslinking of the hydrogel films as the concentration of PVA is increased up to 0.2%. As the concentration of PVA was further increased (HF2 and HF3), the carbonyl peak intensity was found to be reduced. This clearly reveals that increase in the concentration of PVA reduces the crosslinking density. The results of carboxyl content determination were in accordance with this finding. It was also noticed that the carbonyl peak shifted towards lower wavenumber with increase in the amount of PVA from 0.2% to 0.6% (HF1-HF3). An increase in the hydrogen bonding interaction in between the OH groups of PVA and carbonyl groups of free acid and ester groups of the CMC-PVA hydrogel films may be responsible for this shifting. The intensity of peak at 2942 cm^{-1} was found to be increased from HF0 to HF3 (see Fig. 3b) which can be attributed to an increase in the number of CH_2 groups associated with PVA.

3.5. Thermal analysis

Fig. 4 depicts the TGA, DTG and DSC profiles of CMC, PVA, HF0 and HF3. The TGA thermogram of CMC showed two stages whereas that of PVA showed three stages of mass loss (see Fig. 4a). In case of CMC, 10.56% mass loss occurred in between 40 °C to 163 °C due to loss of moisture followed by 42.19% mass loss in the range of 253 °C–316 °C, owing to thermal decomposition of the sample. The maximum degradation temperature (T_m) of CMC was observed at 295.11 °C (see Fig. 4b). For PVA, the initial mass loss due to moisture evaporation took place within the temperature range of 60–190 °C. The major loss (61.96%) occurred in between 239 °C to 374 °C which can be ascribed to the elimination of hydroxyl groups in the form of water and formation of polyene macromolecules [45]. The T_m of PVA was noticed at 305.06 °C. In the third step (410–476 °C), decomposition of macromolecules led to the mass loss of 10.98%. The batch HF0 exhibited degradation in two stages (I: 40–174 °C; II: 223–350 °C) with total weight loss of 62.3% at 485 °C whereas HF3 showed three stages of degradation (I: 30–176 °C; II: 234–343 °C; III: 418–480 °C) to due to presence of PVA. The total weight loss for HF3 at 485 °C was found to be 67.24% which was slightly greater than HF0. Also, T_m of HF3 was found to be reduced when compared with HF0. This clearly reveals that the crosslinking density of HF3 was less than HF0.

The values of the glass transition temperature (T_g) obtained from the DSC curves of HF0 and HF3 helped to reconfirm our above statement (see Fig. 4c). The T_g of HF3 was lower as compared to HF0 indicating decrease in its crosslinking density.

Thus, the results of carboxyl content and instrumental characterization were in complete agreement with each other.

3.6. Tensile strength of hydrogel films

The tensile strength of the hydrogel films was found to be increased with increase in the concentration of PVA up to 0.2% followed by decrease (see Table 2). The reason behind low value of tensile strength of CMC hydrogel films may be the lesser extent of crosslinking. The addition of PVA not only increases the extent of crosslinking but also enhances the hydrogen bonding interaction in between unreacted OH groups of PVA and, OH and carbonyl groups of other components (i.e.

CMC and CA crosslinks) within the CMC-PVA hydrogel films [46]. This can improve the mechanical property of the hydrogel films. The batch HF1 exhibited maximum tensile strength (3.54 ± 0.12 kg/mm^2) than the other hydrogel films. As the concentration of PVA was increased above 0.2%, the tensile strength of the CMC-PVA hydrogel films was found to be reduced slightly which can be attributed to the decrease in the crosslinking density of the hydrogel films. As compared to the pure CMC hydrogel film, CMC-PVA hydrogel films exhibited better mechanical strength.

3.7. Swelling study

Fig. 5 illustrates the swelling behavior of the hydrogel films. All the films showed initial increase in the swelling ratio till equilibrium followed by erosion. The pure CMC hydrogel films (HF0) showed minimum equilibrium swelling ratio (ESR) as compared to the CMC-PVA hydrogel films (HF0.5-HF3) (see Table 2). It was noted that despite of greater extent of crosslinking than HF0, HF0.5 and HF1 showed good swelling. This can be related to the increase in the total polymer concentration where PVA chains will be arranged in between the CMC chains. Secondly, on addition of PVA, the number of free OH groups in the hydrogel film will increase which can enhance the hydrophilicity of the hydrogel films [47]. An increase in the number of unreacted hydroxyl groups can be confirmed from an increase in the intensity of O-H stretching vibrations from HF0.5 to HF3 (see Fig. 3b). The other reason behind increase in the swellability of HF0.5 and HF1 than HF0 may be introduction of highly hydrophilic carboxylic groups due to increase in the number of crosslinks. These free carboxylic groups play an important role in the formation of a polyelectrolyte network within the hydrogel films and improve the water sorption [19]. The time taken by HF1 to reach the equilibrium (5 h) was found to be more than HF0 (4 h) which can be due to greater crosslinking density in HF1. A further increase in the concentration of PVA increased the swellability of the hydrogel films (HF2 and HF3) and also reduced the time required to achieve the equilibrium. This may be due to increase in the hydrophilicity and decrease in the crosslinking density of HF2 and HF3. HF3 showed maximum ESR than the other films (see Table 2).

3.8. GTM loading and release

The GTM loading increased with increase in the swellability of the hydrogel films and hence, the amount of PVA (see Table 2). The greater

Satara

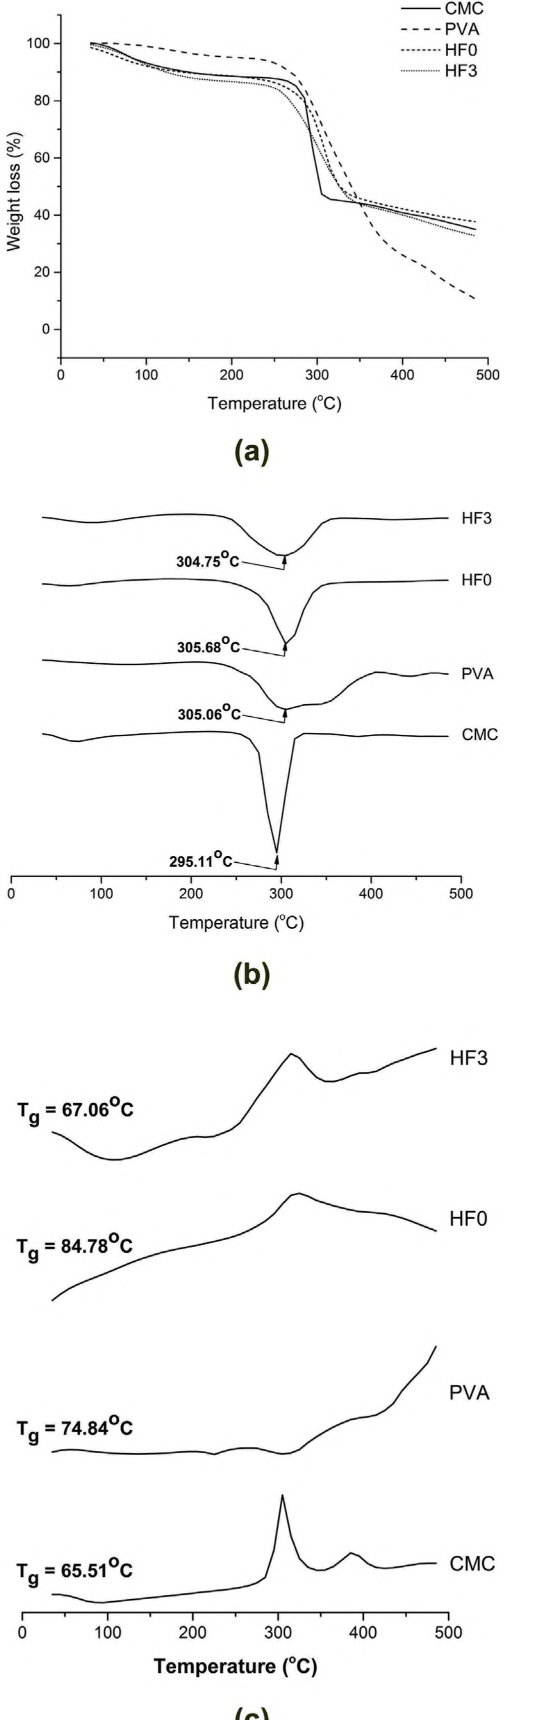

Fig. 4. TGA (a), DTG (b) and DSC (c) thermograms of CMC, PVA and hydrogel films (HF0 and HF3).

the swellability of the hydrogel films more will be their tendency to absorb the drug solution. As a result, large number of drug molecules will get entrapped in the polymeric network of hydrogels. The CMC-PVA hydrogel films showed significant improvement ($p < 0.05$) in the GTM loading than the CMC hydrogel film, with HF3 exhibiting maximum drug loading.

Besides swellability, hydrogen bonding interaction in between amine groups of GTM and hydrogel components (hydroxyl and carbonyl groups), and electrostatic interaction in between protonated amine groups of GTM and deprotonated carboxyl groups of hydrogel films may also contribute in enhancing the loading of GTM. In order to confirm the hydrogen bonding interactions, ATR-FTIR analysis of pure GTM and GTM loaded HF3 was performed (see Fig. 6). The spectrum of GTM showed absorption bands in the range of 2900–3500 cm^{-1} corresponding to N-H stretching vibrations of amino groups. Multiple peaks were found to be fused in the range of 2300–2900 cm^{-1} which represented C-H stretching and absorption due to the other components of GTM [48]. The peaks in the range of 1400–1700 indicated N-H bending, C-H stretching and C-N stretching vibrations. The strong band in the range of 900–1250 was related to C-N and C-O stretching vibrations. In spectrum of GTM loaded HF3, the N-H stretching bands of GTM nearly disappeared. Also, the broad peak of blank HF3 representing O-H stretching shifted from 3284 cm^{-1} to 3217 cm^{-1}, with decrease in its intensity. Such changes suggest the existence of hydrogen bonding interactions in between NH_2 groups of GTM and OH groups of HF3. As the number of OH groups increase from HF0 to HF3, the hydrogen bonding interactions in between GTM and hydrogel components will increase, thus enhancing the loading of GTM in the hydrogel films. The hydrogen bond formation is also possible in between amine groups of GTM and carbonyl groups of hydrogel films. The C-O stretching peak of HF3 at 1082 cm^{-1} shifted to lower wavenumber due to peak of GTM at 1037 cm^{-1}. The other peaks of GTM overlapped with the peaks of HF3 and therefore could not be distinguished.

Furthermore, electrostatic interaction in between GTM and free COOH groups of hydrogel films was possible because the drug loading was carried out in the aqueous drug solution of pH 5.8. At this pH, the amine groups of GTM undergo protonation (pKa = 8.6) whereas free carboxylic acid groups of hydrogel films are deprotonized. Consequently, electrostatic attraction will occur in between NH_3^+ groups of GTM and COO^- groups of hydrogel films, thus assisting in the drug loading improvement. As CMC-PVA hydrogel films exhibited greater carboxyl content than the pure CMC hydrogels, such electrostatic interaction will be more favored in their case.

An increase in the GTM loading in the CMC-PVA hydrogel films inspite of decrease in their carboxyl content indicates that the drug loading was mainly dependent upon swellability and hydrogen bonding.

Fig. 7 demonstrates the drug release profile of the GTM loaded hydrogel films. HF0 showed a noticeable burst release of GTM (26.96 ± 1.48%) within first hour, followed by rapid release. During drying of the drug loaded hydrogel films, most of the drug molecules diffuse along with the solvent towards the surface of the hydrogel films. As a result, a large number of drug molecules concentrate near the surface of the hydrogel films resulting into burst release. An increase in the concentration of PVA reduced the burst release due to an increase in the interaction between GTM and PVA (hydrogen and electrostatic bonding) within the hydrogel films. This will lead to maximum entrapment of GTM within the core of hydrogel matrix and concentration of the GTM molecules near the hydrogel surface will be reduced, thus reducing the burst release in case of CMC-PVA hydrogel films.

In case of HF0, nearly complete GTM release (98.90 ± 1.74%) occurred in 12 h. The CMC-PVA hydrogel films were capable of controlling the release of GTM above 24 h. The retardation of drug release was observed as we move from HF1 to HF3 which can again be attributed to the intermolecular interactions which can restrict the rapid transit of the GTM molecules from the hydrogel matrix into the release

medium. HF3 showed maximum drug release retardation (80.29 ± 2.22% at the end of 24 h) as compared to HF0.5 (98.41 ± 2.14% at the end of 24 h), HF1 (94.03 ± 2.86% at the end of 24 h) and HF2 (86.54 ± 1.94% at the end of 24 h). As HF3, showed maximum drug loading and had greater tendency to control the release of GTM than the other batches, it can be considered as optimized hydrogel film.

3.9. Hemocompatibility

The results of hemolysis assay are shown in Table 2. It was observed that the hemolysis due to pure CMC and CMC-PVA hydrogel films was less than 5% indicating hemocompatible nature of the hydrogel films [7]. From the values of percent hemolysis, it was difficult to determine the effect of PVA on the extent of hemolysis.

4. Conclusion

The CA crosslinked CMC-PVA hydrogel films were formed by esterification-crosslinking mechanism. As the concentration of PVA in the feed was increased, the carboxyl content increased initially indicating increase in the crosslinking density, followed by decrease due to dilution effect. The presence of ester crosslinks and extent of crosslinking was confirmed from ATR-FTIR, solid state ^{13}C NMR and thermal analysis. The CMC-PVA hydrogel films showed good mechanical strength than the pure CMC hydrogel films. An increase in the amount of PVA in the hydrogel films improved the swellability of the hydrogel films and also enhanced the loading of GTM. CMC-PVA hydrogel films were capable of extending the release of GTM above 24 h. The prepared films were hemocompatible. Thus, CA crosslinked CMC-PVA hydrogel films exhibited potential to be used as an efficient and cheap biomaterial for delivery of water soluble basic drugs; however this can be confirmed only after conduction of few more tests such as MTT assay and in *vivo* studies.

Financial source of support

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

Conflicts of interest

Authors declare no conflict of interest.

Acknowledgement

Authors are thankful to the President of YSPM's Yashoda Technical Campus, Satara, for providing necessary facilities in order to carry out this research work. We also acknowledge Shivaji University, Kolhapur and NMR facility centre of Indian Institute of Science, Bangalore for the instrumental analysis.

ABSTRACT

Forced degradation is the process or state in which new drug substance and drug products are with the conditions which are more severe than accelerated stability conditions. The stability of drug substance is a critical parameter which may affect purity, potency and safety. Changes in drug stability can risk patient safety by formation of a toxic degradation product or deliver a lower dose than expected. Therefore it is essential to know the purity profile and behavior of a drug substance under various environmental conditions. The real and accelerated stability of the dosage forms are generally studied in pharmaceutical industry but force degradation study has its importance before starting a new formulation. It is required to demonstrate specificity of stability indicating methods and also provides an insight into degradation pathways of degradation products of the drug substance and helps in elucidation of the structure of the degradation products. Forced degradation studies show the chemical behavior of the molecule which in turn helps in the development of formulation and selection of packaging material. ICH guidelines demonstrate certain degradation conditions like light, oxidation, dry heat, acidic, basic, hydrolysis etc. ICH Q1A, QIB and Q2B exemplify the forced degradation studies. the present review discusses the current process and scenario in performance of forced degradation studies, its method and its importance in new formulation development.

KEYWORD: Degradation condition, Degradation product, Forced degradation, Stability.

INDRODUCTION

A forced degradation study also known as stress testing, stress studies, stress decomposition studies, forced decomposition studies, etc. is the intentional degradation of the API or Drug Product to an appropriate extent by means of various stress conditions such as pH, temperature, light, oxidizing agents, mechanical stress etc. According to FDA guideline, a Force Degradation Study is defined as a validated analytical procedure that accurate and precisely measure active ingredients (drug substance or drug product) free from process impurities, excipients and degradation products. It is a quantitative test method that can detect possible degradants and impurities of drug substance (API) and drug products, normally using HPLC.[18] The main objective of stability indicating method is to monitor results during stability studies in order to guarantee safety, efficacy and quality. Before performing studies, a stability method is necessary so that any possible degradants generated during storage conditions (such as 30°C/60% RH and 40°C/75% RH) can be separated, detected and quantified. Forced degradation studies are used to identify reactions which may occur to degrade a processed product. It is a process that involves degradation of drug products and drug substances at conditions more severe than accelerated conditions and thus generates degradation products that can be studied to determine the stability of the molecule. The stability studies include long term studies (12months) and accelerated stability studies (6months). As compared to stability studies, forced degradation studies help in generating degradants in much shorter span of time, mostly a few weeks.[15] The samples generated from forced degradation can be used to develop the stability indicating method which can be applied latter for the analysis of samples generated from accelerated and long term stability studies. As stated by United States Food and Drug Administration guidelines, a Stability-Indicating method] is defined as a validated analytical procedure that accurately and precisely measures active ingredients free from potential interferences like degradation products, process impurities, excipients, or other potential impurities, and the FDA recommends that all assay procedures for stability studies be stability indicating. The definition in the draft guideline of 1998 read as Validated Quantitative analytical methods that can detect the changes with time in the chemical, physical, or microbiological properties of the drug substance and drug product, and that are specific so that the contents of active ingredient, degradation products, and other components of interest can be accurately measured without interference. Stability-Indicating Method are validated quantitative test methods that can detect changes with time in the chemical, physical, or microbiological properties of drug substances or drug products. They are specific so that the quantity of the active ingredient,

DIRECTOR
Yashoda Technical Campus
Satara

degradation products and other components of interest may be accurately measured without interference in the material being tested. A degradation product is a molecule resulting from a change in the active ingredient brought about over time as a result of processing or storage. The regulation requires a formal written stability testing program whose results are used to establish storage conditions and expiration dates of drug products and further mandates the use of reliable, meaningful, and specific test methods. A drug application is expected to contain a full description of the drug substance or drug product including its physical and chemical characteristics and stability as well as such specifications and analytical methods as are necessary to assure the identity, strength, quality, purity and bioavailability of the drug product, and stability data with proposed expiration dating. If such documentation is generated to support a regulatory submission such as an Investigational New Drug Application (IND), Drug Master File (DMF) or generated to satisfy cGMP requirements for a non-application drug substance or drug product. These data are used to establish, confirm or extend retest intervals (usually) or expiration dating periods (if unstable) for drug substances and expiration dating periods for drug products.[10]

FORCED DEGRADATION STUDIES

The ICH guideline Q1A on Stability Testing of New Drug Substances and Products gives indications for the testing of parameters which are may be susceptible to change during long storage and are likely to affect quality, safety and efficacy must be done by validated stability indicating testing methods. It is mentioned that forced degradation studies or stress testing at temperatures in 10 °C increments above the accelerated temperatures, extremes pH and under oxidative and photolytic conditions have to be carried out on the drug substance so to set up the stability characteristics and degradation pathways to back up the suitability of the proposed analytical procedures.

Objective of forced degradation studies

Forced degradation studies are carried out to achieve the following purposes:[14, 12, and15]

1. To establish degradation pathways of drug substances and drug products.
2. To differentiate degradation products that is related to drug products from those that are generated from non-drug product in a formulation.
3. To elucidate the structure of degradation products.
4. To determine the intrinsic stability of a drug substance in formulation.

5. To reveal the degradation mechanisms such as hydrolysis, oxidation, thermolysis or photolysis of the drug substance and drug product.
6. To establish stability indicating nature of a developed method.
7. To understand the chemical properties of drug molecules.
8. To generate more stable formulations.
9. To produce a degradation profile similar to that of what would be observed in a formal stability study under ICH conditions.
10. To establish degradation pathways and intrinsic stability of the drug molecule.
11. To validate stability-indicating analytical procedures.
12. To identify impurities related to drug substances or excipients.
13. To distinguish degradation products in formulations that is related to drug substances from those that are related to non-drug substances (e.g., excipients).
14. To solve stability-related problems (e.g., mass balance).
15. To generate a degradation profile that mimics what would be observed in a formal stability study under ICH conditions.
16. To facilitate improvements in the manufacturing process and formulations in parallel with accelerated pharmaceutical studies".
17. To choose the correct storage conditions, appropriate packaging and better understanding of the potential liabilities of the drug molecule chemistry".[16]
18. To facilitate improvements in the manufacturing process and formulations in parallel with accelerated pharmaceutical studies.[16]

Regulatory overview

ICH guidelines - regulatory overview

The ICH (The International Committee for Harmonization of Technical Requirements for Registration of Pharmaceuticals for Human Use) has achieved harmonization in many areas of quality e.g. in conducting of stability studies or in providing definition of relevant thresholds for impurity testing. ICH has published several guidelines which have been discussed, agreed upon and adopted by the regulatory authorities of the ICH regions United States, Europe and Japan. When it comes to the topic "forced degradation" the most ICH guidelines emphasize the importance of conducting forced degradation studies, but provide only very general and limited information on the experimental stress conditions and only general guidance on how to conduct forced degradations studies. For example, the guidelines do not provide specific information and recommendations on the stress conditions e.g. pH,

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

temperature ranges, specific oxidizing agents, or conditions to use. Furthermore, the guidelines mostly refer to new drug substances and drug products and do not refer to drug substances and clinical development.

Following ICH guidelines are in place and applicable when searching for guidance with regard to conducting forced degradation studies.
ICH Q1A – Stability Testing of New Drug Substances and Products.[16, 4]
ICH Q1B – Photo stability Testing of New Drug Substances and Products.[2]
ICH Q2B – Validation of Analytical Procedures: Methodology.[3]
ICH Q3A – Impurities in New Drug Substances.[16]
ICH Q3B – Impurities in New Products.[16]
M4Q (R1) – The common Technical Document (CTD).[9]

ICH Q1A – Stability Testing of New Drug Substances and Products.[16, 4]
In ICH Q1A (Stress Testing), there are recommended conditions for performing forced degradation studies on drug substances and drug products. The condition are to examine the effects of temperature (above that for accelerated testing, i.e. (>50°C), humidity (≥75% RH), oxidation and photolysis. Testing in solution should also be performed across a wide pH range either as a solution or suspension. These samples are then used to develop a stability-indicating method.

ICH Q1B – Photo stability testing of New Drug Substances and Products.[2]
ICH Q1B gives recommended approaches to assessing the photo stability of drug substances and drug products. Forced degradation conditions are specified in Section II (drug substance) and Section III (drug product). Exposure levels for forced degradation studies are not defined, although they can be greater than that specified for confirmatory (stability) testing. The actual design of photo stability studies is left to the applicant; however, scientific justification is required where light exposure studies are terminated after a short time, e.g., where excessive degradation is observed. Photo stability testing can be performed on the solid or in solution/suspension. These samples are then used to develop a stability indicating method. Both guidance's, Q1A and Q1B, note that some of the degradation products formed during forced degradation studies may not actually be observed to form during stability studies, in which case they need not be examined further.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

ICH Q2B–Validation of Analytical Procedures.[3]

ICH Q2B gives guidance on how to validate analytical methodology and in section B (impurities not available) there is a recommendation to use samples from forced degradation studies to prove specificity. Specificity is a key factor in determining whether or not the analytical method is stability indicating. Co-elution of peaks or components being retained on the column will underestimate the amount of degradation products formed and could compromise quality and increase risk to the patient.[3]

Q3A (R2) requires identification of each impurity with respect to both chemistry and safety perspectives. The chemistry perspectives include classification and identification of impurities, report generation, listing of impurities in specification and a brief discussion of analytical procedures while the safety perspectives include specific guidance for qualifying those impurities that were not present or were present at substantially lower levels in batch of a new drug substance and used in safety and clinical studies.[13]

Different forced degradation conditions utilized for drug substances and finished dosage form is shown in the "Fig. 1"[20] and Conditions commonly applied for forced degradation is tabulated in Table 1".

Table 1: Condition usually used for forced degradation study.[10]

Degradation Type	Experimental condition	Storage condition	Sampling time
Hydrolysis	0.1N HCL	40°C, 60°C	1,3,5 days
	0.1N NaOH	40°C, 60°C	1,3,5 days
	pH:2,4,6,8	40°C, 60°C	1,3,5 days
Oxidative	3%H_2O_2	25°C, 60°C	1,3,5 days
	Peroxide control	25°C, 60°C	1,3,5 days
	Azobisisobutyronitrile(AIBN)	40°C, 60°C	1,3,5 days
Photolytic	Light,1 X ICH	NA	1,3,5 days
	Light,3 X ICH	NA	1,3,5 days
	Light control	NA	1,3,5 days
Thermal	Heat environment	60°C	1,3,5 days
	Heat environment	60°C/75%RH	1,3,5 days
	Heat environment	80°C	1,3,5 days
	Heat environment	80°C/75% RH	1,3,5 days
	Heat control	Room temperature	1,3,5 days

Appropriate Time to perform forced degradation

The forced degradation studies are not performed earlier it is very vital to conduct them during the phase III (FDA guidance states) to demonstrate the stability of a drug substance, potential degradation pathways and capability and suitability of proposed analytical procedures. Stress studies should be done in different pH solutions, in the presence of oxygen and light, and at elevated temperatures and humidity levels to determine the stability of the drug substance. The forced degradation studies conducted in a single batch. These studies are most useful if done initially in early development or phase I clinical trials which provides timely recommendations for improvement in the manufacturing process, ensure there is sufficient time for degradation product identification, proper selection of stability indicating analytical technique, degradation product identification and optimization of stress conditions which will help later in manufacturing process.

Limit of degradation

Usually degradation of drug substance between 5-20% is considered as reasonable and acceptable for validation of chromatographic assays. Some Pharmaceutical scientists have agreed that approximately 10% degradation is optimal for use in analytical validation. For small pharmaceutical molecules for which acceptable stability limits of 90% of label claim is common. In the event that the experimental conditions generate no or little degradation due to the experimental stability of the molecule, an evaluation should be made to verify if the drug

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

substance has been exposed to energy in excess of the energy provided by accelerated storage (i.e., 40°C for six months).[10]

Selection of drug concentration

Which concentration of the drug should be used for the degradation study has not been specified in regulatory guidance. It is recommended that the studies should be initial concentration of 1 mg/ml. By using drug concentration of 1mg/ml it is generally possible to get even minor decomposition products in the range of detection. It is also suggested that some degradation studies should be done at a concentration which the drug is expected to be present in the final formulations.[15]

Degradation condition:

Typical stress tests include four main degradation mechanisms: heat, hydrolytic, oxidative, and photolytic degradation. Selecting suitable reagents such as the concentration of acid, base, or oxidizing agent and varying the conditions (e.g., temperature) and length of exposure can achieve the preferred level of degradation. Over stressing a sample may lead to the formation of secondary degradants that would not be seen in formal shelf-life stability studies and under-stressing may not serve the purpose of stress testing. Therefore, it is necessary to control the degradation to a desired level. A generic approach for stress testing has been proposed to achieve purposeful degradation that is predictive of long-term and accelerated storage conditions. The generally recommended degradation varies between 5-20% degradation. This range covers the generally permissible 10% degradation for small molecule pharmaceutical drug products, for which the stability limit is 90%-110% of the label claim.[6]

To know how much degradation is enough in stress testing forced degradation can be Classified into following types.[10]

1. Deceptive**:** Good degradation level (<15%) without any relevant degradants.
2. Predictive: Good degradation level (<15%) with one or more relevant degradants.
3. Useless**:** Between 15 to 100% degradation without any relevant degradants

1. Hydrolytic condition

Hydrolytic degradation (Acidic and basic hydrolysis): Hydrolytic degradation is one of the most frequent degradation chemical reactions over a wide range of pH. Hydrolysis is a chemical process that includes decomposition of a chemical compound by reaction with H2O. Hydrolytic degradation under acidic and basic condition involves catalysis of ionizable

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

functional groups present in the molecule. Base or acid degradation testing involves forced degradation of a drug substance by exposure to acidic or basic conditions which generates primary degradants in desirable range. The selection of the type and concentrations of acid or base depends on the stability of the drug substance. HCl or H2SO4 (0.1 to 1 M) for acid hydrolysis and NaOH (or) KOH (0.1–1 M) for base hydrolysis are suggested as suitable reagents for hydrolysis. If the compounds for stress testing are poorly soluble in water, then co-solvents can be used to dissolve them in hydrochloric acid or Sodium hydroxide. Stress testing trial is normally started at room temperature and if there is no degradation, elevated temperature (50 – 70 °C) is applied. Stress testing should not exceed more than seven days. The degraded sample is then neutralized using suitable acid, base or buffer, to avoid further decomposition.[14, 8]

Procedure

For Acid hydrolytic study reflux with 0.1 N HCL at 60°C for 30 minutes. For Base stress reflux with 0.1N NaOH at 60°C for 30 min. For water stress Reflux with water at 60°C for 30 minutes.

2. Oxidative degradation

Hydrogen peroxide is widely used for oxidation of drug substances in forced degradation studies but other oxidizing agents such as metal ions, oxygen, and radical initiators (e.g., azobisisobutyroni-trile, AIBN) can also be used. Selection of an oxidizing agent, its concentration, and conditions depends on the drug substance. It is reported that subjecting the solutions to 0.1–3% hydrogen per-oxide at neutral pH and room temperature for seven days or up to a maximum 20% degradation could potentially generate relevant degradation products.[15] The oxidative degradation of drug substance involves an electron transfer mechanism to form reactive anions and cations. Amines, sulfides and phenols are susceptible to electron transfer oxidation to give N-oxides, hydroxylamine, sulfones and sulfoxide.[7] The functional group with labile hydrogen like benzylic carbon, allelic carbon, and tertiary carbon or α-positions with respect to heteroatom is susceptible to oxidation to form hydro peroxides hydroxide or ketone.[14]

Procedure

Treat with 3% H_2O_2 at less than 30°C for 30 min. The oxidative stress testing is initially carried out in 1% H_2O_2 at room temperature for 6 hr and it can be increased/ decreased to achieve sufficient degradation. Stress agent is changed to achieve degradation if necessary.

DIRECTOR
Yashoda Technical Campus
Satara

3. Thermal degradation

Thermal degradation (e.g., dry heat and wet heat) should be carried out at more strenuous conditions than recommended ICH Q1A accelerated testing conditions. Samples of solid-state drug sub- stances and drug products should be exposed to dry and wet heat, while liquid drug products should be exposed to dry heat. Studies may be conducted at higher temperatures for a shorter period. Effect of temperature on thermal degradation of a substance is studied through the Arrhenius equation.[19]

$$A = ke^{-Ea/RT}$$

Where k is specific reaction rate, A is frequency factor, Ea is energy of activation, R is gas constant (1.987cal/degmole) and T is absolute temperature. Thermal degradation study is carried out at 40–80℃.[14, 15]

Procedure

Thermal degradation can be conducted based on physical properties of API i.e. Melting Point. If melting point of API is less than 150°C, stress at 105°C or 40°C less than melting point whichever is higher. If melting point of API is more than 150°C stress at the nearest melting point and at 105°C.

4. Photolytic degradation

Photo stability studies are performed to generate primary degradants of drug substance by exposure to ultra violet or fluorescent conditions. The rate of photo degradation depends upon the intensity of incident light and quantity of light absorbed by the drug molecule. Samples of drug substance and solid/liquid drug product should be exposed to a minimum of 200 W h/m2 light. The most commonly accepted wavelength of light is in the range of 300 - 800 nm to cause the photolytic degradation. Light stress conditions can induce photo oxidation by free radical mechanism. ICH guideline options requirements widely regarded. UV exposure - NLT 200 watts (sq meters). Visible exposure- NLT 1.2 Million lux-hrs. Functional groups like carbonyls, nitro aromatic, N-oxide, alkenes, aryl chlorides, weak C-H and O-H bonds, sulfides and polyenes are likely to introduce drug photosensitivity. Options per ICH Q1B: Any light source with output similar to D65/ID65 emission standard, such as (i) artificial daylight fluorescent lamp combining visible and UV outputs (ii) xenon lamps or (iii) metal-halide lamps. A cool white fluorescent lamp per ISO 10977 and a near UV fluorescent lamp

having a spectral distribution 320 - 400 nm with a maximum energy emission 350 - 370 nm. A significant portion should be in both bands 320 - 360 nm and 360 - 400 nm.[14]

Procedure

Expose the tablet powder/content of capsule to intense ultraviolet radiation (both at longer and shorter wavelengths) up to minimum of 7 days in UV cabinet.

Acceptance criteria

All requirements of the software are to be met while evaluating peak purity. The purity angle should be less than purity threshold.[5] Peak purity not less than 0.995.[21] If peak purity not observed within the limit this molecule is sensitive for specific condition.

Mass balance of all stressed samples shall be verified by calculating

Mass balance: (% assay of stressed sample +% impurities) X 100/ % assay of unstressed sample.

-mass balance is to be achieved at least up to 95% levels.[11]

-if the mass balance is less than the required criteria investigation to be done and justified.[11]

Analytical tools for separation and identification of degradant

A. Convectional technique[15]

1. Thin layer chromatography (TLC).
2. Solid phase extraction (SPE)
3. Accelerated solvent extraction (ASE)
4. Low-pressure Liquid Chromatography (Flash chromatography)
5. Supercritical fluid extraction (SFE) countercurrent chromatography (CCC)
6. Mass Spectrometry (MS).
7. NMR: NMR spectroscopy is an extremely powerful tool for the analysis of drug degradation products. In order to perform NMR-based structure elucidation of drug degradant products, it is common practice to isolate sufficient material (>1 mg) for NMR analysis.

8. HPLC

HPLC is routine technique for separation of degradants. The normal UV HPLC detectors these days allow for simultaneous measurement at multiple wavelengths, and some of them

6757 YASHODA TECHNICAL CAMPUS SATARA
DIRECTOR
Yashoda Technical Campus
Satara

even give output of ratio plots at two wavelengths. This technique has also been promoted for peak purity testing during development of SIMs.

B. Hyphenated technique[15]

1. GC-MS.
2. LC-MS.
3. Capillary Electrophoresis- Mass Spectrometry (CE-MS).
4. Liquid chromatography-Fourier Transfer Infrared (LC-FTIR)
5. LC-NMR: The advantages of using NMR in combination with HPLC in comparison to HPLC-MS coupling are (1) both HPLC and NMR are conducted in solution and no transfer from one phase to another, as from the liquid to vapour phase in HPLC-MS; (2) NMR measurements are not limited by vaporization and hence by molecular weight; (3) in many cases the structure information by NMR spectra is more extensive, especially when the stereochemistry of the molecule is considered.

Evaluation of forced degradation

Peak purity

Peak purity is comparison of the reference standard to the API in the sample stressed by “forced degradation”. it is used as a support in stability indicating method development. The spectral uniqueness of a compound is used to establish peak purity when co eluting compounds are present. Limitations to peak purity arise when co eluting peaks are spectrally similar, or below the detection limit, or a peak has no chromophore, or when they are not resolved at all.

Mass Balance

Mass balance is calculated by adding the assay value and the amounts of impurities and degradants to evaluate the closeness to regulatory guidance for forced degradation, It is recommended to use appropriate conditions to achieve 5-20% degradation. Success to formulation depends on degradation study and it absolutely depends on skill of researcher, so force degradation study is very important tools for the new formulation development.

CONCLUSION

Forced degradation studies provide knowledge about possible degradation pathways and degradation products of the active ingredients and help elucidate the structure of the degradants. It is essential to help to develop and demonstrate specificity of stability-

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

indicating methods. Forced degradation is important part of the formulation development process as it provides knowledge about the degradation, chemistry of drug substances and drug products. This knowledge is used to develop analytical method, formulation development, packaging development and the design of the official stability studies. They were also useful in the investigation of the chemical and physical stability of crystal forms, the stereo chemical stability of the drug substance alone and in the drug product and mass-balance issues, and for identifying drug related degradation products in formulations. Stress testing has played a critical role in the drug development process, there is no formal regulatory guidance for forced degradation, it is recommended to use appropriate conditions to achieve 5-20% degradation. Success to formulation depends on degradation study and it absolutely depends on skill of researcher, so force degradation study is very important tools for the new formulation development.

ACKNOWLEDGEMENT

I take this opportunity with pride and enormous gratification to express the feelings of thanks and gratefulness from the bottom of heart to all who helped me directly and indirectly throughout this dissertation.

First and foremost, I wish to place my exquisite thanks to our dear Principal, Dr. V.K. Redasani sir for providing infrastructure and facility for completion of the project work.

I place my heartfelt gratitude to my beloved, respected guide Prof. Avinash M. Bhagwat (HOD, YSPM's YTC Faculty of B. Pharmacy, Satara) for their valuable guidance.

My special thanks to Mr. Mahesh Rao sir (Assistant Manager, Micro Lab Ltd., Bangalore) for helping us by providing relevant information about the project.

I am also thankful to Shivaji University Kolhapur & my college for providing me facilities regarding project work.

ABSTRACT

The main objective of this project work was to determine fructose-glucose ratio in different honey samples. In this project, we tested 7 different samples of honey available in Satara region for its fructose-glucose ratio. The determination of fructose and glucose ratio ultimately gives the % by weight of glucose and fructose. As we know that sugar is unhealthy in excess to diabetes patients and hence comparison between regular sugars and honey must be done so that we can give a better alternative to regular sugar in a healthy way. Honey fructose and purified fructose plays different roles in our body in a very different way. By studying the percent reducing sugars in honey we are trying to conclude that how honey can be a good and healthy sweetener as that of other sweeteners which are causing hazardous effects on our body and health.

KEYWORDS: Honey, Fructose, Glucose, Fructose-Glucose ratio, Reducing sugars, and Honey Fructose.

INTRODUCTION

What Is Honey?

Honey is naturally occurring sweet fluid produced by the honeybees by enzymatic transformation of floral nectar ingested by them and deposited in the cells of hives or combs.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

The Indian species of honeybees belongs to the genus *Apis* of which the common ones are *A. florea* (Family-Apidae). In commerce, Honey may be collected from naturally occurring hives in grooves and forests, by pressing and squeezing in the traditional method or may be centrifugation of the combs containing honey in artificially maintained apiaries. Both should be filtered before storage or use.[1]

Synonyms

Puspasava, Pusparasa, Ksaudra, Madhvika, Madhu.[1]

Description

A thick, syrupy, translucent, yellow to yellowish brown fluid; tastes sweet with a pleasant odour and flavor. When poured on to a tray as a thin layer, no impurities like mould, dirt, beeswax, insect fragments, plant debris or any other objectionable foreign matter should be visible to the naked eye in daylight.[1]

Honey has been 'nature's sweetener' for centuries and is frequently marketed as 'superior' to sugar. Honey has been a traditional sweetener for thousands of years long before we discovered how to extract and refine sugar from sugar cane or sugar beet.

Today we consume over 40 times more sugar than honey yet it remains a favourite flavouring in foods like honey cakes, sauces, breakfast cereals, honey-coated nuts, yoghurts etc.

Sugar is 100 per cent sucrose, while honey is made up of around 75 per cent sugars, of which roughly half is glucose and half is fructose (these proportions may vary depending on the source of the nectar). The remaining 20 to 25 per cent is water with a trace of protein, a trace of fat and a trace of fibre, small amounts of plant acids, waxes, gums, pigments and volatile oils which have antioxidant and antibacterial properties. Honey also contains vitamin B and minerals but in very less quantity and not nutritionally significant.[4]

Purpose of the Study

The main purpose of this study to determine fructose-glucose ratio in honey of different brands available in satara region.

This will ultimately lead to the information about the honey, fructose-glucose ratio, advantages of honey over regular sugar and how to maintain a good and healthy diet.

DIRECTOR
Yashoda Technical Campus
Satara

Research Questions

During this study, many questions came in our way to find out importance of this study like,

- Is honey healthier than sugar?
- What are the honey health benefits?
- What is fructose- glucose ratio?
- Why it is so important?
- What is the role of fructose and glucose in our body?
- How fructose-glucose affects our health?

Is Honey Healthier Than Sugar?

Honey once described as 'nectar of the gods' and is often considered a 'natural', healthier sweetener than sugar but nutritionally its true advantages are minor.

As we said before sugar is 100 per cent sucrose, honey is made up of around 75 per cent sugars, of which roughly half is glucose and half is fructose. The remaining 20 to 25 per cent is water with a trace of protein, a trace of fat and a trace of fibre, which explains why honey has fewer 'sugars' or kilojoules/calories than sugar when you compare them weight for weight.

Comparison of sugar vs. honey:-

100g white sugar :- 1700kJ/406Cals.

100g of honey :- 1400kJ/334Cals.

But in day-to-day life most of us we eat honey a teaspoon or a tablespoon not by its weight. And hence as the honey is denser than sugar 1 tablespoon of honey weighs 28g, whereas a tablespoon of sugar weighs only 16g. So, if you are taking one tablespoon of honey instead of sugar you are consuming more calories than regular sugar.[4]

What Are the Honey Health Benefits?[2]

- Useful in weight management
- Strengthens immune system
- Nourishes your skin and face
- Boosts your memory
- Home remedy for cough
- Natural home remedy for Dandruff

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

- Used for healing wounds
- Acts as natural sleeping aid
- Eases sinus issues
- Help with gum diseases
- Natural energy drink
- Prevents and helps control Eczema and many more.

What Is Fructose-Glucose Ratio?

Usually sugar contains Fructose and glucose in linked chain system, which has approximately half fructose and half glucose.

Glucose is simple sugar which is main energy source for body cells.

Fructose is a type of simple sugar that makes up 50% of table sugar (sucrose).

However, fructose needs to be converted into glucose by the liver before it can be used by the body. And hence limited quantity of fructose should be consumed to avoid its harmful effects.

Fructose-Glucose ratio gives the values of fructose and glucose so that we can determine its quantity and could take diet in appropriate measured quantities or could limit the diet in a healthy way.

Why Fructose-Glucose Ratio Is Important?

Basically fructose-glucose ratio calculated from fructose and glucose values present in the sample.

Fructose and glucose both are the simple sugars which provide quick energy and can be easily utilized by body cells for energy production.

Both sugars are good for health only in a safe and limited quantity but become very harmful when consumed in higher quantity.

As we have seen that glucose directly get absorbed in blood and raises the blood sugar level very quickly whereas fructose for absorption need to be metabolized by liver for absorption.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

As the fructose is twice sweeter than glucose most of the sugary sweeteners and added sugars in soft drinks, desserts and in bakery sweet food products contains high fructose in it. Before the mass production of refined sugar, humans rarely consumed it in high amounts. While some sweet fruits and vegetables contain fructose, they provide relatively low amounts.

High glucose consumption is unhealthy and leads to the type 2 diabetes and heart diseases. While excessive fructose is undoubtedly unhealthy, its health effects are controversial.

And hence glucose and fructose levels must be within the safe range so the determination of fructose and glucose levels becomes very important when it came to the health.[3]

What Is The Role Of Fructose And Glucose In Our Body?

Where high fructose level leads to the various harmful diseases such as ……

Mal-absorption: - Some people do not absorb all the fructose they eat. This condition is known as fructose mal-absorption, which is characterized by excessive gas and digestive discomfort. All carbohydrates, even rapidly digestible sucrose, cause abdominal discomfort when consumed to excess. Some individuals may exceed their capacity for fructose absorption if large amounts are eaten. Under such circumstances, fructose may be associated with abdominal complaints, such as bloating and flatulence. In those with fructose mal-absorption, fructose acts as a fermentable carbohydrate and is categorized as a FODMAP.[3]

Appetite:-Fructose does not suppress appetite in the same way as other sugars, fructose does not cause rapid surges and dips in blood glucose levels, which is one factor thought to stimulate eating.[3]

And hence the determination of both fructose and glucose becomes very necessary.

Unlike glucose, fructose causes a low rise in blood sugar levels. Therefore, some health professionals recommend fructose as a “safe” sweetener for people with type 2 diabetes.

However, others are worried that excessive fructose intake may contribute to several metabolic disorders as follows.[3]

- Glucose and fructose are metabolized very differently by the body.
- While every cell in the body can use glucose, the liver is the only organ that can metabolize fructose in significant amounts.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

- When people eat a diet that is high in calories and high in fructose, the liver gets overloaded and starts turning the fructose into fat.
- Impair the composition of your blood lipids. Fructose may raise the levels of VLDL cholesterol, leading to fat accumulation around the organs and potentially heart disease.
- Increase blood levels of uric acid, leading to gout and high blood pressure.
- Cause deposition of fat in the liver, potentially leading to non-alcoholic fatty liver disease.
- Cause insulin resistance, which can lead to obesity and type II diabetes.
- Fructose doesn't suppress appetite as much as glucose does. Thus, it might promote overeating.
- Excess fructose consumption may cause leptin resistance, disturbing body fat regulation and contributing to obesity.

Note: - It's important to realize that all of this does not apply to whole fruit.

Fruits aren't just watery bags of fructose; they are real foods with a low-calorie density and lots of fiber. They're hard to overeat on and you would have to eat very large amounts to reach harmful levels of fructose. In general, fruit is a minor source of fructose in the diet compared to added sugars.

The harmful effects of fructose apply to a Western diet supplying excess calories and added sugars. It does not apply to the natural sugars found in fruits and vegetables.[3]

How Fructose And Glucose Affects Our Health?

Many soft drinks, desserts, beverages, high fructose corn syrup and bakery food products use high amounts of fructose in it.[20]

Some have suggested that a rise in the use of HFCS in the United States (US) over the past 30 years could explain the rise in obesity and type II diabetes, and that this is due to increased fructose consumption.[5,20]

A recent study claimed that High-Fructose Corn Syrup (HFCS) causes obesity while sucrose does not, this study was thoroughly unconvincing. Over 8 weeks, rats with 24-hour access to control chow, sucrose, or HFCS had no difference in body weight. Rats with 12-hour access to HFCS had increased body weight, and rats with 12-hour access to sucrose did not. They didn't restrict any of the control rats to 12-hour access.

DIRECTOR
Yashoda Technical Campus
Satara

Their main finding was that over seven months, female rats with 24-hour access to HFCS had increased abdominal and uteral fat and increased blood levels of triglycerides, but rats with 12-hour access to sucrose or HFCS did not.

Speaking of honey, however, research suggests that the fructose in honey doesn't behave anything like the fructose in refined sweeteners. Isn't that a sweet surprise!

Researchers fed weanling rats for two weeks on diets that were 65% (by weight of dry matter) starch, honey, or purified glucose and fructose purchased from Sigma. They provided glucose and fructose at the same ratio at which they occur in honey.[5]

And the findings were surprising such as[5] ….

- Purified fructose increased triglyceride levels, as expected. Honey seemed to increase triglyceride levels, but the increase was not statistically significant.
- Purified fructose, but not honey fructose, decreased blood levels of vitamin E. This suggests that it promoted oxidative stress.
- Purified fructose, but not honey, seemed to promote inflammation. Nitric oxide is very important to blood vessel function in small amounts, but large increases are usually a sign that immune cells have been activated to create an inflammatory state. Honey fructose just doesn't seem to promote inflammation the way purified fructose does.
- After all this they took some heart tissue and mixed it with iron sulfate and vitamin C. The combination of high doses of iron and vitamin C can create oxidative stress. This test shows how susceptible the heart tissue would be to suffering damage in the face of oxidative stress. Once again, purified fructose poses harm while honey fructose does not.[5]

MATERIALS AND METHOD

Methodology for Study of Fructose-Glucose Ratio in Different Honey Samples

Determination of Total Reducing Sugars

Total Reducing Sugars[1]

Reagent

Soxhlet modification of Fehling's solution – Prepare by mixing equal volumes of solution A and solution B immediately before using.

Copper Sulphate solution (Solution A) – Dissolve 34.639 g of copper sulphate crystals in water, dilute to 500 ml and filter through glass wool or filter paper.

Standardization of copper sulphate solution – Using separate pipettes, pipette accurately 5 ml of Solution A and 5 ml of solution B into a conical flask of 250 ml capacity. Heat this mixture to boiling on an asbestos gauze and add standard inverted sugar solution from a burette, about one milliliter less than expected volume which will reduce the fehling solution completely 48 ml. Add one ml of methylene blue indicator while keeping the solution boiling. Complete the titration within 3 minutes, the end point being indicated by change of color from blue to red. From the volume of invert sugar solution used, calculate the strength(S) of the copper sulphate solution by multiplying the titre value by 0.001 (mg/ml of standard invert sugar solution). This would give the quantity of invert sugar required to reduce copper in 5ml copper sulphate solution.

Potassium sodium tartrate (Rochelle Salt) solution (solution B) - Dissolve 173g of potassium sodium tartrate and 50 g of sodium hydroxide in water, dilute to 500 ml. let the solution stand for a day and filter.

Hydrochloric acid: – specific gravity 1.18 at 20’C (approximately 12 N).

Standard invert sugar solution

1. Weigh accurately 0.95 g sucrose and dissolve it in 500 ml water.
2. Add 2 ml of concentrated hydrochloric acid. Boil gently for 30 minutes and keep aside for 24 hours.
3. Neutralize with sodium bicarbonate and make the final volume to 1000 ml; 50 ml of this solution contains 0.05 g invert sugar.

Methylene blue indicator: – 0.02% in water.

Procedure[1]

1. Place accurately weighed about 1 gram (W) of prepared sample of honey into a 250 ml volumetric flask and dilute with about 150 ml of water.
2. Mix thoroughly the contents of the flask and make up volume to 250 ml with water.
3. Using separate pipettes, take accurately 5 ml of solution A and solution B, in a porcelain dish.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

4. Add about 12 ml of honey solution from a burette and heat to boiling over an asbestos gauze.
5. Add 1 ml methylene blue indicator and while keeping the solution boiling complete the titration, within 3 minutes.
6. The end point being indicated by change of color from blue to red.
7. Note the volume (H) in ml of honey solution required for the titration.[1]

Calculations

A. Total reducing sugar % by mass = $\frac{250\times100\times S}{H\times M}$

Where,

S = strength of copper sulphate solution,

H = volume in ml of honey solution required for titration, and

M= mass in gm of honey.

Fructose-Glucose Ratio[1]

Reagents

Iodine solution: – 0.05 N.

Sodium hydroxide solution: – 0.1 N.

Sulphuric acid: – concentrated.

Standard sodium thiosulphate solution: – 0.05 N.

Procedure[1]

1. Pipette 50 ml of honey solution in a 250ml stoppered flask.
2. Add 40 ml of iodine solution and 25ml of sulphuric acid.
3. Stopper the flask and keep in dark for 20 minutes.
4. Acidify with 5ml of sulphuric acid and titrate quickly the excess of iodine against standard sodium thiosulphate solution.
5. Conduct a blank using 50ml of water instead of honey solution.[1]

Calculations

A. Approximate glucose,

% by mass (w) = $\frac{(B-S)\times0.004502\times100}{a}$

6757 YASHODA TECHNICAL CAMPUS SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Where,

B = volume of sodium thiosulphate solution required for the blank,

S = volume of sodium thiosulphate solution required for the sample, and

a = mass of honey taken for test.

B. Approximate fructose, % by mass (x) =

$$\frac{\text{Approximately total reducing sugars, \% - w}}{0.925}$$

C. True glucose, % by mass(y) = w – 0.012 x

D. True fructose % By mass (z) =

$$\frac{\text{Approximate reducing sugars, \% - y}}{0.925}$$

E. True reducing sugars, % by mass = y + z

F. Fructose – Glucose Ratio =

$$\frac{\text{True Fructose, \% by mass (z)}}{\text{True Glucose, \% by mass (y)}}$$

OBSERVATIONS AND READINGS

Readings for Total Reducing Sugars

Sr. No.	Sample code	Readings (ml)			Mean (ml)
1	A	15	14.7	15	15
2	B	17.7	17.7	17.8	17.7
3	C	16.2	16	16.2	16.2
4	D	16.6	16.8	16.7	16.7
5	E	17	17	17.1	17.0
6	F	16.7	17.1	16.9	16.9
7	G	16.7	16.7	16.7	16.7

From the formula given for determination of total reducing sugars calculated are as follows:

- Strength of Copper Sulphate was found to be = 0.055 mg/ml.
- Calculation Results for Total Reducing Sugar in different samples is as follows: -

1. Total Reducing Sugar % by Mass of sample A = 91.66
2. Total Reducing Sugar % by Mass of sample B = 77.68
3. Total Reducing Sugar % by Mass of sample C = 84.87
4. Total Reducing Sugar % by Mass of sample D = 82.33
5. Total Reducing Sugar % by Mass of sample E = 80.88

YASHODA TECHNICAL CAMPUS SATARA 6757
DIRECTOR
Yashoda Technical Campus
Satara

6. Total Reducing Sugar % by Mass of sample F = 81.36
7. Total Reducing Sugar % by Mass of sample G = 82.33

Readings for Fructose-Glucose Ratio

Sr. No.	Sample code	Readings (ml)			Mean (ml)
1	A	93.9	94.5	94.2	94.2
2	B	112.3	112	112	112
3	C	97	96.5	97	97

5	E	100	100.5	100.5	100.5
6	F	97	97	97	97
7	G	98.2	98.2	98.3	98.2

- Sodium Thiosulphate require for Blank was (B) = 120ml.

By above given formulas % Glucose, % Fructose, True Glucose, True Fructose and Fructose-Glucose ration is calculated and mentioned in results.

RESULTS AND DISCUSSION

Here in this project I perform the experimental work by process given above and it is the standard procedure for determination of fructose- glucose ratio in honey referred from the Aayurvedic Pharmacopeia.

Standard Values

Reducing sugars: – not less than 65% by wt.

Fructose-Glucose ratio: - not less than 1% by wt.

I took different 7 samples of honey from different store in Satara region.

By performing the given standard procedure, the obtained results and readings after calculating are enlisted in table given below….

Table 1: Fructose-Glucose ratio and other sugars in honey.

Parameters	A	B	C	D	E	F	G
Total reducing sugar	91.66	77.68	84.87	82.33	80.88	81.36	82.33
Glucose% (y)	45.87	13.58	40.85	41.25	34.52	40.90	38.69
Fructose % (z)	49.49	69.29	47.58	44.40	50.11	43.71	47.16
y + z	95.37	82.87	88.43	85.66	84.63	84.64	85.86
Fructose-Glucose ratio	1.07	5.10	1.16	1.07	1.45	1.06	1.21

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

In this project the final results and ranges of % of fructose, glucose and reducing sugars in different honey samples found to be within the standard values and limits.

There were no adulterations found in honey samples.

As honey contains sugar level in limited quantity and hence won't show more harmful effects as that of the regular sugar.

Honey contains sugars along with various plant metabolites, antioxidants and other various enzymes hence it provides sweetness in a healthy way.

Variables

- Fructose-glucose ratio also depends on types of honey.
- Honey can be obtained by honeycomb but bee's collects honey from various flowers and hence exact and only specific flower nectar can't be obtained in honey.
- Honey of marketed products can be adulterated and hence the sugar levels may vary.
- Other formulation processes of honey in industry like pasteurization may affect the heat sensitive compounds and hence will affect in proportions.

CONCLUSION

- Fructose – Glucose ratio in different samples of honey available in Satara region is within normal range and limits.
- Total reducing sugars in different samples of honey are within standard limits.
- As honey contains sugars in limited quantity and also contains other plant metabolites, enzymes etc. it gives additional healthy effects along with the sweetness.[4]
- Honey fructose does not give same side effects as that of the purified fructose and hence become a better choice of sweetener than the regular sugars.[5]

Future of project

As we have concluded that honey can be a better option for sweetness than that of the regular sugars and various sweeteners available in market. But exactly how honey is beneficial? Why honey fructose does not gives same side effects as that of the purified fructose is the big question?

AKNOWLEDGEMENTS

I express my deep gratitude and indebtedness to Mr. Avinash M. Bhagwat. (Project guide, HOD, YSPM's YTC Faculty of B. Pharmacy, Satara) for his valuable guidance throughout the course of this project and gave me the golden opportunity to do this wonderful project on this topic. This also helped me in learning so many things regarding research.

I wish to place my exquisite thanks to our dear principal, Dr. V. K. Redasani sir (Principal, YSPM's YTC Faculty of Pharmacy, Satara) for providing infrastructure and facility for completion of the project work.

I am also thankful to Mr. S. S. Deshpande sir (Co-guide, Production Manager, Ayurvedeeya Arkashala Ltd. Satara) and Mrs. P. N. Kulkarni mam (QC Department, Ayurvedeeya Arkashala Ltd. Satara) for giving me opportunity to do joint work with Ayurved Arkashala Ltd. Satara for my project and giving me motivation and valuable guidance.

Abstract

Most of the marketed cosmetics when applied on the skin cause dryness of skin after its long term use which results less life of skin problems of acne and redness. Solution for this problem is use of scrub gel once or twice in week which consist all herbal ingredients which increases cleansing, softening, moisturizing, fairness of skin. In the present work we have formulated the herbal facial scrub by using a different herbal powders and it was evaluated by using the parameters like smoothness, appearance, spreadibility, irritation etc.

Abstract

Polyherbal soap was prepared by using sandal wood and Orange peel extract and evaluated by using various evaluation parameters such as organoleptic characteristics, pH, foam height and retention, skin irritation and high temperature stability. Prepared Polyherbal soap having good appearance better cleansing and foaming effect and doesn't have any side effects.

Delaying Effect of Polyherbal Formulation on Cataract in STZ-NIC-induced Diabetic Wistar Rats

K. K. MALI*, SUCHETA S. LIGADE[1] AND R. J. DIAS[2]

Department of Pharmaceutics, YSPM'S Yashoda Technical Campus, Faculty of Pharmacy, Wadhephata, Satara-415 011, [1]Department of Pharmacology, Sant Gajanan Maharaj College of Pharmacy, Gadhinglaj, Kolhapur-416 503, India, [2]Department of Pharmacy, Government Polytechnic, National Highway No 6, Jalgaon-425 002, India

The aim of the study was to evaluate the effectiveness of polyherbal formulation on cataract development in streptozotocin-nicotinamide-induced diabetic rats. Diabetes was induced by streptozotocin (65 mg/kg, ip) and nicotinamide (90 mg/kg, ip). The diabetic rats were orally treated with polyherbal formulation (therapeutic dose, 28.71 mg/kg and 2X therapeutic dose, 57.42 mg/kg) and metformin (150 mg/kg), for 12 weeks. Serum glucose levels, body weight, histopathology of pancreas were used to evaluate the antidiabetic activity while the histopathological study of eye and protein content in lens were used to evaluate the protective effect of polyherbal formulation on cataract development. The progression of cataract in rat lens was observed with a slit-lamp biomicroscope. A daily treatment of polyherbal formulation for 12 weeks resulted in significant ($p<0.05$) decrease in serum glucose level, body weight and improved protein content in the lens. It also delayed the incidence of cataract in diabetic rats. The histopathological study showed that there was regeneration of pancreatic β-cells. The results observed with polyherbal formulation were found to be comparable to those obtained with metformin. Results suggested that the polyherbal formulation possessed antidiabetic activity and prevented cataract development.

Key words: Cataract, streptozotocin, nicotinamide, polyherbal, antidiabetic

Diabetes mellitus (DM) is a chronic disease characterized by disorders in carbohydrate, fat and protein metabolism[1]. The number of patients with DM is predicted to increase globally to 200 million within the next few years[2]. World Health Organization reports showed that 32 million people had diabetes in the year 2000 in India and now 422 million adults are living with diabetes according to the latest 2016 data[3,4].

The cause of significant mortality in diabetes is due to the development of secondary complications[5]. DM leads to the development of both microvascular complications like retinopathy, cataract, nephropathy, and macrovascular complications like atherosclerosis, high blood pressure, heart attack and stroke[6].

In the present study, the effect of a polyherbal formulation was studied on one of diabetic complications, the cataract. It is clouding of the crystalline lens of the eye or in its envelope[7]. As the extracellular glucose diffuses into the lens, it is the most affected body part in diabetes[8]. The mechanism of cataract involves generation of free oxygen radicals, which causes direct modification of the inner lens proteins, such as cross-linking, aggregation, precipitation contributing to yield opacity and leading to cataract[6]. Now a days cataract is the major cause of blindness and surgery is the only available solution[9]. The prevention of opacification or delays in the development of cataract remains a challenge[10].

Many anticataractogenic agents are available, but due to lack of success in patients, no drug has yet been approved for clinical use[11]. There are many herbal products and polyherbal formulations with known anticataract activity such as *Ocimum sanctum*, *Curcuma longa*, *Azadirachta indica* and Diabecon 400[12], Okudiabet[13], Diashis[14] and Glycoherb[15]. Hence, the present study was undertaken to evaluate

one such polyherbal formulation composed of six different herbal extracts. The composition of polyherbal formulation is given in Table 1. This formulation available in the market has been proved to be effective in diabetes, but there is no data available whether this polyherbal formulation is effective in preventing diabetic complications. Therefore, an attempt was made to evaluate its effectiveness in delaying cataract development.

MATERIALS AND METHODS

Streptozotocin (STZ) was procured from Chemvenio, LIC, Gulbarga, India. Nicotinamide (NIC) was procured from Lasons India Ltd, Taloja, Raigad, India and the polyherbal formulation was supplied by Nisarga Biotech, Pvt. Ltd., Satara, India.

Experimental animals:

Forty male Wistar rats (180-200 g) were procured from Shri Venkateshwara Enterprises, Bangalore, India and were housed in the animal house of Satara College of Pharmacy, Satara, India at a temperature of 25±1° and humidity (45±5 %) with a 12:12 h day:night cycle. Animals were kept in polypropylene cages with a stainless steel lid with free access to standard pelleted diet and water *ad libitum*. The studies were carried out in the Pharmacology Department of Satara College of Pharmacy. The experimental protocol was approved by the Institutional Animal Ethics Committee of Satara College of Pharmacy, Satara (SCOP/IAEC/017/11-12) and it was carried out according to the Committee for the Purpose of Control and Supervision on Experiments on Animals guidelines for laboratory animal facility.

Acute toxicity studies:

Acute oral toxicity of the polyherbal formulation was carried out as per the guidelines set by the Organization for Economic Co-operation and Development revised draft guidelines 423. Healthy Wistar rats (3 animals/dose) of either sex were used in this study. Rats were fasted overnight and orally fed with the polyherbal formulation in increasing dose levels of 5, 50, 300, and 2000 mg/kg. These rats were observed for behavioural (alertness, restlessness, irritability and fearfulness), neurological (spontaneous activity, reactivity, touch response, pain response and gait) and autonomic (defecation and urination) symptoms continuously for 24 h. After a period of 24 h, the animals were observed for the next 14 d for mortality.

TABLE 1: COMPOSITION OF POLYHERBAL FORMULATION

Ingredients	Botanical name	Quantity
Guduchi	*Tinospora cardifolia*	35 mg
Dalchini	*Cinnamomum zeylanicum*	50 mg
Haridra	*Curcuma longa*	48 mg
Methika	*Trigonella foenum-graecum*	180 mg
Nimba	*Azadirachta indica*	4 mg
Maricha	*Piper nigrum*	2 mg
Excipient	-	qs

Induction of experimental diabetes:

Rats were fasted for 16 h and NIC (90 mg/kg) was administered through intraperitoneal route. After 15 min of administration of NIC, STZ (65 mg/kg, ip) was injected. STZ is capable of inducing fatal hypoglycaemia as a result of massive pancreatic insulin release, therefore, the rats were provided with 10 % glucose solution after 6 h of STZ administration for the next 24 h to prevent hypoglycaemia. Mortality or any other adverse effects were closely monitored. After allowing a week's time for the development and aggravation of diabetes, rats with moderate diabetes (i.e. blood glucose concentration >200 mg/dl) that exhibited glycosuria and hyperglycaemia were selected for the experiment[16].

Experimental design:

After inducing experimental diabetes, rats were divided into five groups, each comprising a minimum of eight rats. Carboxymethyl cellulose (CMC; 0.1 % w/v) in distilled water was used as the vehicle. Polyherbal formulation at doses of 28.71 and 57.42 mg/kg was suspended in vehicle and administered to treatment groups orally every day for 12 w. These 5 groups of rats consisted of normal control group, normal rats administered with 0.1 % CMC (1.25 ml/kg/day, po); diabetic control group, STZ-NIC-induced diabetic rats, administered with 0.1 % CMC (1.25 ml/kg/day, po); standard treated group, diabetic rats administered with metformin (150 mg/kg/day, po) for 12 w; therapeutic dose group, diabetic rats administered with a therapeutic dose of polyherbal formulation (28.71 mg/kg/day, po) for 12 w. The therapeutic dose was calculated from human dose of polyherbal formulation, which was 319 mg for an adult of 70 kg and converted it to animal dose based on no observable adverse effect level (NOAEL)[17,18]. Diabetic rats administered with 2X therapeutic dose of polyherbal formulation (57.42 mg/kg/day, po) for 12 w to check the effectiveness of a higher dose.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Evaluation of antidiabetic activity:

Serum glucose level and body weight was measured weekly. The dosage was adjusted weekly according to any change in body weight to maintain similar dose per kg body weight of rat over the entire period of study for each group. The survived animals from each group after 12 w were euthanized by sodium pentobarbital, with a dose of 200 mg/kg injection followed by cervical dislocation and each rat was utilized to test for histopathology of pancreas, one eye was used for histopathological studies and other eye for protein determination[19].

Evaluation of cataract development:

Rats were lightly anaesthetized with ether for assessing cataract progression by observing the rat lens with a slit-lamp biomicroscope in Drishti Eye Hospital, Satara. Pupil of rats was dilated by instillation 2 to 3 drops of Tropicacyl Plus® (tropicamide 0.8 % and phenylephrine 5 %) in the conjuctival sac of each eye. Tropicacyl was added prior to ophthalmic examination[20]. Lenticular changes were observed in each month. The progression of cataract observed during slit lamp examination is mentioned as follows, as per grading scale[21]; stage 0: clear lenses and no vacuoles present; stage 1: vacuoles cover approximately one half of the surface of the anterior pole, forming a subcapsular cataract; stage 2: some vacuoles disappeared and cortex exhibits a hazy opacity; stage 3: a hazy cortex remained and dense nuclear opacity present; stage 4: a mature cataract, dense opacity in both cortex and nucleus.

Estimation of total protein of eye lens:

For estimation of total proteins, the eyes were enucleated and the lenses were dissected separately[22]. One dissected lens was homogenized in 4.0 ml deaerated phosphate buffer saline (pH 7.3) using a homogenizer. The lens homogenate was dialyzed for 24 h and centrifuged for 2 h at 4° at 13 500 rpm. Protein content of the supernatant was determined using Biuret method kit (Rackon diagnostics, India)[23].

Histopathology of pancreas and eye:

The pancreas and eyes of animals were removed and fixed in 10 % formalin. Then they were embedded in paraffin. Organ sectioning was carried out on a microtome, sections were stained with haematoxylin and eosin and observed for histopathological changes under microscope[21].

Statistical analysis:

Data were expressed as mean±SE (standard error). Statistical analysis was done by using one way analysis of variance followed by Tukey's Multiple Comparison Test by using GraphPad Prism software. $P<0.05$ was considered as the minimal level of statistical significance.

RESULTS AND DISCUSSION

Acute toxicity studies did not show any mortality up to 2000 mg/kg given as single oral administration. Hence, the study was carried out at the dose levels of 28.71 mg/kg and 57.42 mg/kg. Diabetes was induced in 40 rats using STZ (65 mg/kg, ip) and NIC (90 mg/kg, ip). All animals from normal control group were alive till the end of the experiment. About 50 % of diabetic rats died from the diabetic control group, 12.5 % of diabetic rats died from standard group treated with metformin while 25 % of diabetic rats died in both therapeutic and 2X therapeutic dose of polyherbal formulation-treated group. The mortality rate in metformin and polyherbal formulation-treated group was less as compared to diabetic control group.

The effect of polyherbal formulation as well as metformin treatment on the blood glucose concentration in control and experimental groups of rats is shown in Table 2. There was an increase in serum glucose level in diabetic control group after administration of STZ-NIC intraperitoneally. The serum glucose level decreased significantly ($p<0.05$) after oral administration of metformin (91.4 %), therapeutic (82.5 %) and 2X therapeutic dose (87.51 %) of polyherbal formulation when compared with diabetic control group.

Change in the body weights of all 5 groups of animals during the course of study is given in Table 3. There was significant ($p<0.05$) decrease in the body weight of diabetic rats from control group compared to that of normal rats. In diabetic control rats, the weight loss was about 51.85 % at the end of study. However, this significant weight loss was prevented in diabetic rats orally treated with metformin as well as polyherbal formulation. The weight loss was reduced in metformin-treated group approximately by 7 % whereas in the groups treated with therapeutic dose of polyherbal formulation and 2X therapeutic dose of polyherbal formulation, the weight loss reduction was found to be 2 and 3 %, respectively.

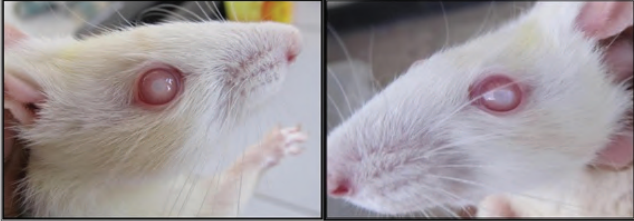

Fig. 1: Rats with cataract

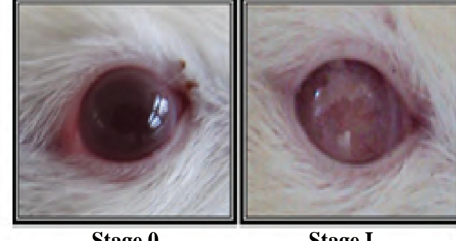
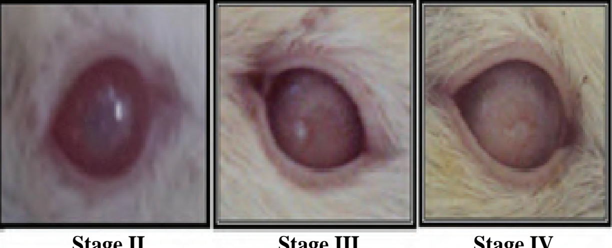


Stage 0 **Stage I**



Stage II **Stage III** **Stage IV**

Fig. 2: Stages of cataract development

Cataracts were developed in the eyes of STZ-NIC-treated rats throughout the experimental period. The development of cataract and different stages of development are shown in the figs. 1 and 2. All lenses in the normal control group and standard group treated with metformin were clear throughout the study with no opacification. The onset of cataract in the diabetic control group was observed from the 3rd w of STZ-NIC injection. At the end of 12th w, 50 % lenses were in the 4th stage, 50 % lenses were in 3rd stage in the diabetic control group. Whereas onset of cataract in the polyherbal-treated group was observed from 10th w in case of therapeutic dose and from 12th w group in case of 2X therapeutic dose. The progression of cataract was slower in rats treated with therapeutic and 2X therapeutic dose of polyherbal formulation. At the end 12th w, 12.5 % of lenses of therapeutic dose were in

DIRECTOR
Yashoda Technical Campus
Satara
1406

the 2nd stage and 12.5 % lenses of 2X therapeutic dose were in the 1st stage as shown in the fig. 3.

The lens is made of mostly water and protein. Denaturation of proteins leads to lens opacification. Therefore, total protein content was analysed in all groups and the results are given in Table 4. The content of protein observed at the end of study in normal control rat was 1.02 g/dl, while in the diabetic control group it was 0.27 g/dl. Protein content was found to be significantly normal i.e. 0.91 g/dl in case of rats treated with metformin. While in rats treated with therapeutic dose and 2X therapeutic dose the protein content was 0.66 and 0.73 g/dl, respectively.

The results of histopathological examination of pancreas are shown in fig. 4. Fig. 4A showed normal acinar pattern and islet cells in normal control. There was no inflammation and fibrosis. Fig. 4B, showed the pancreas of rats treated with STZ-NIC. Number of islet cells was found to be decreased and also ratio of acinar to islet cell was not maintained. Deposits of a homogenous eosinophilic material largely occupying the islet and around blood vessels were seen. This could be a localized amyloidosis, which has been documented to occur in the pancreas in many diabetics.

TABLE 4: ESTIMATION OF TOTAL PROTEIN FROM EYE LENS AT THE END OF STUDY

Name of group	Treatment given	Total protein (g/dl)
Normal control	0.1 % CMC (1.25 ml/kg/day, po)	1.0212±0.1333 (n=8)
Diabetic control	0.1 % CMC (1.25 ml/kg/day, po)	0.2741±0.0057# (n=4)
Standard	Metformin (150 mg/kg)	0.9100±0.05151† (n=7)
Therapeutic dose	Polyherbal formulation (28.71 mg/kg)	0.6554±0.04469c†# (n=6)
2X Therapeutic dose	Polyherbal formulation (57.42 mg/kg)	0.7292±0.03542† (n=6)

Values are expressed as mean±SEM. Statistical analysis was done by using one way ANOVA followed by Tukey's multiple comparison test. $P<0.05$ was considered statistically significant ([c]$p<0.05$); #data compared with normal control; †data compared with diabetic control

In case of pancreas treated with standard metformin, the acinar cells were found to be normal as shown in fig. 4C. The islets were present in adequate proportion and having normal cellularity of beta cells. There was no evidence of infiltration or fibrosis. The pancreas of rats treated with therapeutic dose of polyherbal formulation is shown in the fig. 4D. Presence of few islets of beta cells was observed. Islets were largely occupied by a uniform eosinophilic material and few atrophic cells. Eosinophilic materials also surround the blood vessel. There was slight regeneration of β cells. Fig. 4E, shows pancreas of rats treated with 2X therapeutic dose of polyherbal formulation. The acinar cells appeared to be normal. The islets were present with a large proportion and with smaller volume as compared to diabetic control. There was more regeneration of β cells as compared to therapeutic dose and further destruction of the remaining β cells in islet appeared to be stopped.

The results of histopathological examination of rat eyes are shown in fig. 5. Fig. 5A showed histopathology of normal control rat eye. The lens material showed deposition of fibrinoid material, and rest shows proteinaceous material. Retinal layers were normal. Fig. 5B, showed eye of rats treated with STZ-NIC. The lens material has hyalinised and fibrinoid material showing changes due to developed and developing cataract. Retinal layers showed degeneration and detachment. The histopathological section of eye treated with metformin showed normal lens material and retinal layers (fig. 5C). A nearly developing opacity and coagulation of lens material was observed in rats

treated with therapeutic dose of polyherbal formulation along with fibrosis of lens material (fig. 5D). The 2X therapeutic dose showed early changes of lens material along with hyalinization (fig. 5E).

In the present study, diabetes was induced by administration of STZ and NIC. STZ is an antibiotic and structurally is a glucosamine derivative of nitrosourea. It causes hyperglycaemia mainly by its direct cytotoxic action on the pancreatic beta cells. It also causes alkylation or breakage of DNA strands and a consequent increase in the activity of poly-ADP-ribose synthetase, leading to decrease in an enzyme in beta cells finally leading to energy deprivation and death of beta cells[24]. Here we had administered NIC along with STZ. The NIC is an antioxidant, which exerts protective effect on the cytotoxic action of STZ by scavenging free radicals and causes only minor damage to pancreatic beta cell mass producing type 2 diabetes.

The antidiabetic plant extracts may involve one or more compounds, which decreases blood glucose levels suggesting that the natural constituents could act synergistically to induce a hypoglycaemic effect[15]. Combining several medicinal herbs achieved extra therapeutic effect[25]. The polyherbal formulation used in the present study is composed of extract of six different herbs having different mechanism of action. The plant *guduchi* in formulation has antidiabetic activity, as it causes increased entry of glucose into the peripheral tissues and organs like liver. The oral administration of an aqueous root extract is reported to exert a significant reduction in blood glucose and brain lipids, increase in body weight. Also the alcohol extract of *guduchi* has preventive effect on the development

of cataract in alloxan-induced diabetic rats[26]. Previous studies on cinnamon suggest it could affect protein phosphorylation dephosphorylation reactions in the intact adipocytes, which helps to reduce sugar level[27]. *Haridra* lowers blood sugar, increases glucose metabolism and potentiates insulin activity more than three fold. Several animal studies have demonstrated that curcumin present in *Haridra* can overcome insulin resistance and can delay cataract incidence in diabetic patients[28]. The studies on fenugreek showed that the hypoglycemic effects of fenugreek is due to presence of the amino acid 4-hydroxyisoleucine in fenugreek seeds. It causes insulin release in rat pancreatic islet cells[29]. The seeds may double the regeneration of β-cells in pancreas[30]. The leaves of fenugreek contain high content of lutein and prevent free radical formation. Hence it can be used as a good dietary source of lutein to protect and ameliorate cataract[31]. Neem blocks the action of epinephrine on glucose metabolism. It was found that chloroform extracts of Neem showed significant regeneration property of functional β-cells[12]. Piperine, a substance present in *Maricha* has been found to increase absorption of selenium, B-complex vitamins, beta-carotene, curcumin as well as other nutrients from food[32]. Thus effect of combination of all these extract in polyherbal formulation might decrease serum glucose levels, reduces destruction of β-cells and body weight, also improves protein contents and delays cataract.

Metformin was used as a standard drug in the current study. It acts principally by increasing insulin sensitivity and increase in the peripheral glucose utilization and decrease in hepatic glucose production. The UK Prospective Diabetes Study demonstrated

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

a significant survival advantage for type 2 patients started on metformin as first-line therapy[33].

Treatment of polyherbal formulation showed significant decrease in serum glucose level. It may be due to effect of combination of all these extract in polyherbal formulation as discussed above. Metformin-treated animals showed rapid normalization of serum glucose as compared to polyherbal formulation-treated animals.

Polyherbal formulation treatment also prevented the loss in body weight as compared to diabetic control rats. It may be due to amelioration of glycaemic control and structural proteins synthesis[34]. Metformin has long been recognized as a suitable first-line agent for type 2 diabetes as it is the only oral hypoglycemic agent associated with no weight gain or even weight reduction[33].

Decrease in serum glucose level and weight loss prevented by the treatment with 2X therapeutic dose of polyherbal formulation is more as compared to therapeutic dose of polyherbal formulation. In the standard group cataract was not developed. This might be due to increased peripheral glucose utilization[34]. Treatment with polyherbal formulation delayed the progression of cataract. After induction of diabetes by STZ-NIC there was development of cataract in diabetic control group. Incidence of cataract was observed from 3rd w in diabetic control rats while in case of therapeutic dose it was at 10th w and in case of 2X therapeutic dose it was at 12th w. This suggested that the polyherbal formulation exerted protective action on cataract and also resulted in delaying progression of cataract. The 2X therapeutic dose showed greater delay as compared to therapeutic dose.

The lens is made of mostly water and protein. Crystallins are the major structural proteins in the lens accounting for up to 90 % of total soluble protein[35]. Protein denaturation has been considered to be the ultimate change that results in lens opacification. The treatment with polyherbal formulation improved the total protein content in eye lenses probably by preventing osmotic stress and subsequent leakage of proteins through the inhibition of aldose reductase (AR)[36]. This improvement was more in 2X therapeutic dose as compared to therapeutic dose. While metformin-treated group of rats showed more improved protein content as it is supposed to have an antioxidant property[37].

In diabetes there is destruction of pancreatic β-cells. Histopathological examination of pancreas supported presence of islet cells and few foci of regeneration of pancreatic β-cells. The regeneration of β-cells was comparatively more in rat pancreas treated with 2X therapeutic dose. In case of pancreas treated with standard metformin normal cellularity of beta cells was observed.

Histopathological study of eye lenses in normal group and metformin-treated group showed normal lens and retina while diabetic animals showed necrotic changes in lens and retina. The eye lenses-treated with therapeutic and 2X therapeutic dose showed early changes in the lens material. This also suggests that the polyherbal formulation can help in delaying cataract and it could be dose-dependent.

On the basis of these results, it can be concluded that a combination of glycemic control, regeneration of pancreatic β-cells, AR inhibition and antioxidant potential could be the possible mechanisms of polyherbal formulation in delaying the cataract. The polyherbal formulation is effective as antidiabetic and delays the progression of cataract in a dose-dependent manner. Moreover, further longer duration studies of polyherbal formulation in chronic models are necessary to assess a potent antidiabetic effect and its effect on diabetic complications.

Home Automation Using Arduino And IoT

Pratiksha R. Patil[1], Chaitali T Ghadge[2]
Department of Electronics And Telecommunication
[1,2] BE, YSPM'S YASHODA TECHNICAL CAMPUS,SATARA

Abstract- *To improve the human living standard , reduces human efforts, energy and for the time saving smart home is the need of the times.The cost of project is low and the system offers a home security using Arduino microcontroller, Wi-Fi.Wi-fi is use foe access and the control appliances using Smart devices(smart phones,i-watch,PC,etc) application.*

The proposed system is being used to control the devices of people's daily needs by using nternet of things. We can use any electrical home devices like light,fan,fridge, tv,etc.for controlling with the help of web-browser, smart devices.

This system helps us to control different electrical devices such as light, fan, detection of gas leakage and vibration in home.

Keywords- Arduino ATmega328, ESP8266-01 vibration sensor, MQ6 gas sensor,light,fan,IOT

I. INTRODUCTION

The project aims at designing an advanced IOT based home automation system using web server and Wi-Fi technology. The devices can be switched ON/OFF using a smart devices. Automation is the need of hour.Wi-Fi is a technology that helps control the equipment of the house. Bluetooth and Zigbee are used to in most wireless networks [1]. In the system we will take ESP8266-01 Wi-Fi module in it we have put programming of Arduino uno to control electrical equipments.

The controlling device for the automation in the project is Arduino UNO. Arduino UNO reads the data,after that it decides the switching action of electrical devices which connected to it through Relays[2]. This proposed system is a combination of Android smart phone and embedded system which include Arduino Uno Board, Wi-Fi module and Relay circuit.[11] In our project , we used a Wi-Fi wireless technology to monitor the device. An android application is installed in a mobile device i.e android smart phone.With the help of this application we can control devices individually. The signal given from our smart devices received by Wi-Fi module through the cloud.

As per instructions given bythe user, the relay circuit switched ON/OFF the particular devices.The purpose of using Wi-Fi wireless technology is it provide a high range an.[3]

II. LITREATURE REVIEW

Through detailed study of "Home Automation Using Internet of Thing" proposed by Shopan Dey, Ayon Roy and Sandip Das,they explains, that they have used Raspberry pi module to connectESP8266-01 module to the internet.

Through this module they are controlling various device through web page and also through android application [1]. K. Venkatesan and Dr. U. Ramachandraiah explains in their paper Zigbee module in Arduino mega through which they are controlling devices. They have used various sensors for various purpose. Also they have provided real time notification, feedback on web-server in which customers can see what is happening in their home [2].

"Programmable Infrared Accessory Light Switch" by Warsuzarina Mat Jubadi and Normaziah Zulkifli explains how TV remote is used to control room light and other appliances. Here IR remote and one IR receiver is used and programmed it stores the frequency of the existing remote and use them directly to control appliances [3].

Twinkle Gondaliya proposed,A Survey on an Efficient IOT Based Smart Home [4] in that an efficient implementation for IoT for monitoring and automation system and it uses the portable devices as a user interface. Portable devices use for communicate with home automation network through an Internet gate, by means of low power communication protocols like zigbee, Wi-Fi etc.

This project aims at controlling home appliances via Smartphone using Wi-Fi as communication protocol and arduino uno. The user here will move directly with the system through a web-based interface over the web whereas home appliances like lights, fan etc. are remotely controlled through easy website.

"Vaibhav4, Vinay Dhakad Kunal1, Dhake Tushar2, Undegaonkar Pooja3, Zope Lodha5" explains "Smart Home Automation using IOT "[5].A System hardware is divided into three parts i.e. PCB, humidity sensor, and Arduino controller.

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

Relay, LPT port, transistor, diode resister are integrated on PCB. They have connected two devices to the PCB i.e. fan and light. Humidity sensor is connected to Arduino .It will sense humidity and temperature as well.

Arduino and PCB are connected to PC..Arduino and PCB will interact with each other through PC. They have measured temperature and humidity. They have set time by which it continuously senses temperature and humidity. In the screenshot, it continuously senses temperature and humidity after every 5 seconds. ADVANTAGES (a) Adds Safety Through Appliance and Lighting Control (b) Secures Home Through web control Increases Convenience through Temperature Adjustment (c) Save time (d) Save money and increase convenience (e) Allow to appliances control when out of town.

H.Santhi,Gayathri.P,explains in paper [6] that the Home automation or automation of an office is done so with electronics and communication advancement.
Platforms based on cloud computing help to connect to the things surrounding everyone so that one can find it easy to access anything and everything at any time and place in a user friendly manner using custom defined portals.. The exciting opportunities yet to increase the connectivity and relationship of home devices automation purposes to the internet.

D.Maheshkumar explains in paper [8] about ideas, movements, technical approaches and considerations for strategic planning for the Internet of Things.

It was a simple review of research in IoT models, privacy issues and considerations for businesses to include in their way forward for IoT. Attempts are being made to harness the seismic shift caused by the IoT movement. While unification or standardization is lacking it seems like it may be left to economic competition on what moves forward.
This paper was a very small fraction of what IoT literature provides and was meant to educate individuals as it has done for the author in order to initiate discussions at their organizations. Prof .S A Jain.Stevan Maineka, Pranali Nimgade,explains in paper [9] The Internet of Things (IoT) is an atmosphere in which objects, animals or people are make available with distinct identifiers 'Internet of Things' defines a number of skills and research disciplines that allow the Internet to reach into the real world of physical objects. Technologies like short-range wireless communications, RFID, ad hoc and wireless sensor networks (WSNs) which is the part of Internet of Things (IoT).. This paper describes the concept of WSN, IoT and architecture of Home Automation.
Arun Cyril Jose1 and Reza Malekian2 in paper [10] Various Home Automation Methodologies Analyzed from a Security Standpoint and Challenges in Home Automation Security. Various home automation technologies considered in this work include context-aware home automation systems, central controller-based home automation systems, Bluetooth-based home automation systems, Global System for Mobile communication or mobile-based home automation systems, Short Messaging Service-based home automation systems, General Packet Radio Service-based home automation systems, Dual Tone Multi Frequency-based home automation systems, and Internet-based home automation systems.

III. PROBLEM STATEMENT

When people are pursuing ever-growing high quality of their lives today.This leads to more and more facilities and home appliances include into their building.How to control and manage these versatile facilities and appliances in a house?

When we are outside of the home and gas leakage will happen ,and also whenever earthquake will occur,then what shall we do?

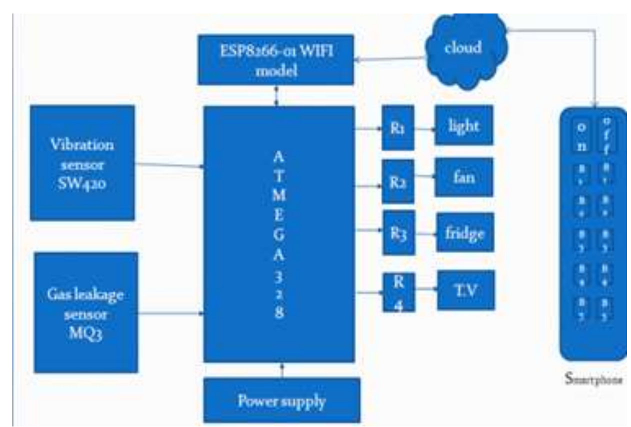
The main aim of this project “automatic home” to minimize the cost & loss electricity and also man power to manually on-off the home appliances.

IV. PROPOSED WORK

System architecture: This system consists of Arduino controller ATMEGA 328p,powersupply,vibrationsensor,gas leakage sensor,relays,light,fan and smart phone.

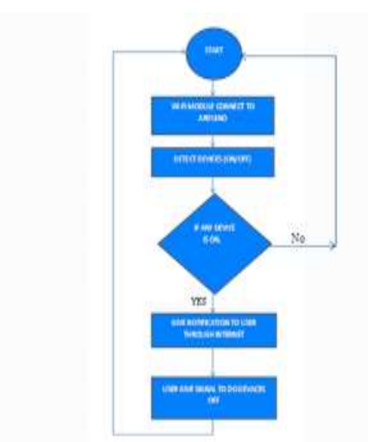
The main aim of this project is to build a smart home device which can be used to control the home appliances via internet.

BLOCK DIAGRAM:



FLOW CHART OF WORKING DEVICES:

DIRECTOR
Yashoda Technical Campus
Satara



System working:

vibration sensor and gas leakage sensor connected to the Arduino controller atmega328p and we also used four relays for the light, fan, and by using other two relays we will give OR gate connection to the main switch. When lights, fan and gas is leaked at home, you will get a notification on the smart phone. The device can also connected to an Android App which you can develop on your own using some applications like MIT App inventor etc.

By using this app, we will be able to monitor and control the home appliances from any part of the world with ease. when you get a notification, you can turn off the button in your phone. User give a signal to do devices off. this signal goel to the wifi model through cloud and it will sent to the atmega328p.whenever there is an earthquake, the notification will go on the user's phone, so the main switch will be switched off and short circuits will not happen.

Proposed System Implementation:

1. Start
2. System will be initialized.
3. Initially all control devices will be OFF after power-on.
4. Wi-Fi module will be initialized.
5. Open mobile application on Android smart phone.
6. Establish connection between Wi-Fi module and mobile application on Android Smart phone.
7. Waiting for control command to be received from Android mobile application.
8. Send control command (ON/OFF device) from Android mobile application.
9. Check received control command format.
10. If received command is "ON" then turn ON the particular Device.
11. If received command is "OFF" then turn OFF the particular Device.
12. stop.

ADVANTAGES:

1. Devices can be controlled from long distance.
2. It can be easily situated homes.
3. It can use everyone .only we have knowledge of the text.
4. Format of the text is easy to understand.

DISADVANTAGES:

The system is network dependent. Hence network congestion can reduce the reliability of the system.

V. CONCLUSION

When you are out of the house, you cannot turn off the electrical appliances in the house.Also there is a possibility of fire in the house due to gas leakage and earthquake. So, we are doing "IOT based Home Automation using Arduino Uno" to avoid all this.

Due to this project, when we are out of the house we can turn off electrical appliances in the house. The main switch will be switched off when the gas leakage goes beyond the specified limit, due to the gas sensor. When an earthquake or a big quake occurs, there will be vibration sensor in the house and the main switch will be switched off.

Benefit of this project is, power utilities will not continue unnecessarily. Electricity will be saved. The harm caused by gas leakage can be prevented by the gas sensor. Due to earthquake there will be a short circuit that will be avoided. This project will make people's lifestyle comfortable to some extent.

FUTURE SCOPE

Reducing the time delay to turn on and off of an appliance in the home. Adding speech identification to the system using automatic smart phone detection through Wi-fi such that it will operate the loads automatically when it is in range. Expansion of range of Wi-Fi such that one can operate allowed long distance through smart phone.

ABSTRACT

Introduction: At present days there was considerable attention has been taken to develop lipid based pharmaceutical preparation which improves solubility as well as permeability leads to improve oral bioavailability of poorly water soluble drug with a system known as self nano-emulsifying drug delivery system. **Materials and Methods:** The SNEDDS of garlic oil was prepared by using oleic acid as oil, capryol PGMC as a surfactant and ethanol as a co-surfactant, as the garlic oil shows better solubility in these excipients which is find out by constructing pseudo-ternary phase diagram. The Km = 3 was selected for the preparation of SNEDDS of garlic oil because it shows better nanoemulsion region as compared to Km = 1 and 2. **Discussion:** The formulated SNEDDS of garlic oil was evaluated for physical characterization, thermodynamic stability, rheology study, globule size and zeta potential, dispersibility study, cloud point determination, % transmittance, drug content, FTIR study and *in vitro* drug release study. Three batches of SNEDDS of garlic oil was formulated using Km value 3 which cover maximum nanoemulsion region, containing oleic acid (solubility 57.53 ± 0.45), Capryol PGMC (solubility 59.80 ± 0.82) and ethanol (solubility 49.83 ± 0.30). Based on the compatibility study, optimum globule size (177.2 nm), minimum polydispersity (0.386), higher drug content (90.89 ± 0.68) and higher drug release (98.85%), batch F2 was optimized. **Conclusion:** The bioavailability problem can be overcome by the Self nano- emulsifying drug delivery system, which presents the more drug in solubilized form in the body as compared with other conventional drug delivery systems.

Key words: Self Nanoemulsifying Drug Delivery System, Garlic oil, Pseudo ternary phase diagram, Capryol PGMC, poorly water soluble drug.

INTRODUCTION

Garlic, botanically known as *Allium sativum* Linn. a member of Liliaceae family is one of the earliest documented example of plants employed for the treatment of diseases and maintenance of health.[1] Garlic oil is best known for its number of medicinal values such as anti-atherosclerosis, blood lipid and sugar modulation, antifungal, antimicrobial, anti-thrombolic, cardiovascular disease treatment and stimulation of immune system.[2] However, the application of garlic oil in the food industry is limited due to its volatility, strong odour, insolubility in water and low physicochemical stability.[3] To overcome these problems various methods are listed in the literature which include incorporation of hydrophilic excipients, solid dispersion, micellar solubilization, microemulsion etc. But in recent years considerable attention has been made to develop lipid based pharmaceutical preparation as it improves not only solubility but also permeability which leads to improve oral bioavailability of poorly water soluble

DIRECTOR
Yashoda Technical Campus
Satara

drugs, such a system is known as Self Nanoemulsifying Drug Delivery System (SNEDDS).[4]

Self Nanoemulsifying Drug Delivery Systems (SNEDDS) are regarded as anhydrous forms of the nanoemulsion. SNEDDS are homogenous liquid mixtures consisting of drug, natural or synthetic oil, surfactant and co-surfactant that have a rival ability of spontaneously forming fine oil-in-water (O/W) nano-emulsions of size about 200 nm or less, upon dilution with water. These preparations are thermodynamically stable and transparent or translucent system. Nano-sized dispersion of nanoemulsion was stabilized by the addition of surfactants and co-surfactants. SNEDDS are also known as nanoemulsion, miniemulsion, ultrafine emulsion or submicron emulsion. These systems were formulated mainly by using medium chain triglycerides, oils and non-ionic surfactant, which is important in oral ingestion. SNEDDS are one of the stable nanoemulsion and it provides a large interfacial area for partitioning of drug between oil and aqueous phase, thereby improves the rate of drug dissolution and increases bioavailability of the drug formulation. SNEDDS are the most preferred drug delivery system due to their stability, practicability of easy oral administration and ability to enhance drug self emulsification inside the gut.[5,6]

Thus, utilizing SNEDDS as a promising technology to overcome the problems of low bioavailability leads to develop a drug with improved solubility as well as improved physiochemical stability.[7] Hence, SNEDDS of garlic oil will control different aspects of drug efficacy such as pharmacokinetics, bioavailability, targeted delivery, non-specific toxicity and immunogenicity and will be beneficial as suitable dosage form which results in better patience compliance and improved therapeutics.[8,9]

MATERIALS AND METHODS

Garlic oil (Sanket Enterprises, Mumbai), Oleic acid (Molychem, Mumbai), Capryol PGMC (Gattefosse, France), Ethanol and Methanol (S. D. fine Chemicals, Mumbai). All other materials or chemicals used were of analytical grade.

Selection and screening of drug components

For the selection of suitable components with good solubilizing capacity for garlic oil, saturation solubility of garlic oil was examined in various oils (oleic acid, cotton seed oil, almond oil, castor oil), surfactant (Capryol PGMC, Labrafac PG, tween 20, span 80, cremophore EL) and co-surfactants (Ethanol, propylene glycol, PEG 200, glycerol). In this solubility study the excess amount of drug i.e. garlic oil was added into screw caped glass vials containing two ml of each excipients followed by sealed vials. The sealed vials were kept in sonicator for 2 h. after that the mixture was kept in water bath at 40°C for 24 h and then these vials were centrifuged at 15000 rpm for 30 min. The samples were collected and filtered using a membrane filter (0.45 micro meter). The filtrate was suitably diluted with methanol and drug concentration was obtained by using UV Visible spectrophotometer.[10]

Construction of pseudo ternary phase diagram

The pseudo ternary phase diagram was constructed without garlic oil to recognize the maximum self-emulsifying domain existence and to specify the optimal ratio of oil, surfactant and co-surfactant for the SNEDDS formulations. The pseudo ternary phase diagrams were constructed by drop wise addition of distilled water to homogeneous liquid mixture of oil, surfactant and co-surfactant, at ambient temperature by water titration method.

From result of solubility studies and screening of solubility of excipient: Oleic acid, Capryol PGMC and ethanol were selected as oil, surfactant and co-surfactant. The mixture of oil and surfactant / co-surfactant (S/CoS) i.e S_{mix} at certain weight ratio were diluted with water in drop wise addition. Surfactant and co-surfactant mixture were mixed in different weight ratio at different Km value 1, 2, 3 ratio i.e. 1:1, 2:1, 3:1 (w/w). The oil and S_{mix} were mixed at ratio of 1:9, 2:8, 3:7, 4:6, 5:5, 6:4, 7:3, 8:2, 9:1 Figure 2, 3 and 4. Slow titration with aqueous phase was done to each ratio of oil and S_{mix} and visual observation was carried out for transparency and flowability of nanoemulsion. The mixtures were examined for turbidity to transparency. Clear and isotropic mixtures were deemed to be within Nano emulsion region. On the other hand, the emulsion with coarse droplets or temporary emulsion exhibiting coalescence or creaming on terminating stirring was considered "bad". All the tests were performed in triplicate.[11,12]

Preparation of liquid SNEDDS

The phase diagram was constructed at different Km values. The Km value at which nano-emulsion region obtained was selected for further studies. Three formulations were selected from this nano- emulsion region.

Oil, surfactant and co-surfactant were accurately weighed and mixed by gentle stirring. Based on solubility, formulation amount of garlic oil (100mg) was dispersed into mixture of oil and surfactant and co-surfactant. All the components were mixed by gentle stirring on

Garlic F2	100	40	10	50
Garlic F3	100	50	10	40

magnetic stirrer until garlic oil was completely dissolved. Mixture was sealed in glass vial and stored at room temperature for further study.[13] The composition of selected formulations showed in Table 1 and Figure 6.

Evaluation of SNEDDS[14-16]

Physical characterization

The organoleptic properties of the SNEDDS such as, color, odor and physical state were checked by visual observation.

Thermodynamic stability study

The thermodynamic stability of lipid based formulation can be adversely affected by precipitation of the drug in the excipients matrix. This can be also lead to phase separation of the excipients affecting not only formulation performance as well as visual functioning. The thermodynamic stability study was based on following three tests:

Heating and cooling cycle

Three heating/cooling cycles between 4°C and 40°C with storage at each temperature for not less than 24 h. The resultant formulations were evaluated for their thermodynamic instability like precipitation and phase separation. The formulation which qualifies this test was subjected to further study.

Centrifugation study

The prepared formulations were centrifuged using laboratory centrifuge at 5000 rpm for 30 min. The resultant formulations were then determined for any instability problem, such as phase separation, cracking or creaming. A formulation which qualifies this test subjected for further study.

Freeze thaw cycle

To determine the stability of SNEDDS freeze thawing was employed. The prepared formulations were subjected to three freeze thaw cycles, which included freezing at –4°C for 24 h followed by thawing at 40°C for 24 h. Then centrifugation was performed at 3000 rpm for 10 min. Then the tested formulations were observed for phase separation.

Rheological study

The viscosity of the prepared formulations was determined by using Brookfield viscometer which determines the consistency of nano-emulsion formulation. 1ml of each prepared formulations were diluted 10 times with distilled water and then viscosity was measured using Brookfield viscometer and assessed visually for any phase separation.

Globule size and zeta potential determination

Droplet size of SNEDDS was determined by photon correlation spectroscopy that analyses the fluctuations in light scattering due to Brownian motion of the particle, using a Zetasizer. The zeta potential of the SNEDDS should be evaluated as it may further give an idea of the colloidal stability. Both these tests were carried out by using Nanoparticle analyzer sz-100 (Horiba Scientific, Japan).

Dispersibility test (Assessment of self emulsification)

The efficiency of self- emulsification of oral nanoemulsion is determined by using a standard USP XXII dissolution apparatus II. 1ml of each formulation is added to 500 ml of water at 37±0.5°C. The stainless steel dissolution paddle rotating at 50 RPM provided gentle agitation. The emulsification time assessed visually.

Percent transmittance

The percent transmittance of the prepared formulations were measured using UV Visible double beam spectrophotometer or Single Beam Spectrophotometer using distilled water as blank at suitable wavelength. For this study 1ml of each prepared formulations were diluted to 100 ml of distilled water and observed for any turbidity and % transmittance was observed by using UV-visible spectrophotometer (Shimadzu UV 1800) against distilled water at suitable wavelength.

Cloud point determination

The prepared formulations were diluted with distilled water in the ratio 1:250, placed in water bath and its temperature was increased gradually. Cloud point was measured at the temperature at which there was a sudden appearance of cloudiness occurred.

Drug content

The total amount of drug in the formulation was analyzed by dissolving the formulation in 10 ml of

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

methanol. This solution was vortexed for 10 min in vortex mixture. The mixture was centrifuged at 15,000 rpm for 10 min. Then the supernatant was filtered through Whatman filter paper. The concentration of garlic oil was analyzed spectrophotometrically at 306 nm.

FTIR Study

The prepared formulations were analyzed by Fourier Transform infrared spectroscopy (UV Agilent Technology) to characterize the probable structural modification produced. The sample was analyzed in the region of 4000 and 400 cm^{-1} and then sample or mixture kept into sample holder for analysis.

In vitro drug release study

In vitro dissolution studies of prepared formulations were carried out. The prepared formulations were filled in hard gelatin capsule. *In vitro* drug release profile of garlic oil from SNEDDS was assessed using USP dissolution testing apparatus I (basket type) at 50 rpm with 900 ml 0.05 M NaCl of pH 1.5 as dissolution medium. Temperature was set at 37. 0± 0.5°C and sampling interval were fixed at 5, 10, 15, 20, 25, 30 min.1ml of sample withdraw at each time interval and replaced with 1ml fresh 0.05M NaCl of pH 1.5 solution. The solution was immediately filtered through whatman filter paper and the filtrate was diluted with dissolution medium up to 10ml and evaluated for the drug content using UV-Visible spectrophotometric method at 306 nm.[17]

RESULTS AND DISCUSSION

From the solubility study oleic acid was selected as oil, capryol PGMC as surfactant and ethanol as co-surfactant, as the garlic oil shows more solubility than the other components which were shown in Figure 1.

Construction of pseudo-ternary phase diagram

Preparation of liquid Self Nano-emulsifying Drug Delivery System

Oleic acid-Capryol PGMC-Ethanol-Water based system selected at final Pseudoternary phase diagram of various surfactants and co-surfactant weight ratio was constructed and system of highest water absorption (highest nano emulsion region) selected for formulation. The phase diagram at Km value 3 showed better nano-emulsion existence region than 1 and 2.

Three formulations were selected from phase diagram at Km value 3, named as Garlic F1, Garlic F2, Garlic F3, as shown in Figure 5. Quantitative unit compositions of selected formulation of SNEDDS were presented in Table 2.

Evaluation of prepared SNEDDS

Physical characterization

The physical characterization of formulated batches was shown in Table 3.

Table 2: Composition of selected formulations.

Batch	Drug (mg)	Smix (ml)	Oil (ml)	Water (ml)
F1	100	30	10	60
F2	100	40	10	50
F3	100	50	10	40

Table 3: Physical characterization of formulated batches.

Sr. No.	Parameters	Result
F1	Physical state	Liquid
F2	Color	Light yellow
F3	Taste	Characteristic

Table 4: Thermodynamic stability study of formulated batches.

Batch	Heating cooling cycles	Centrifugation test	Freeze thaw cycles
Garlic F1	+	+	+
Garlic F2	+	+	+
Garlic F3	+	+	+

Thermodynamic stability study

Thermodynamic stability of SNEDDS was essential to its performance, which can be affected by precipitation of the drug. In addition the formulation having poor physical stability can affects the formulation performance and it also leads to phase separation. Hence thermodynamic stability studies were performed by performing heating cooling cycle, centrifugation test and freeze thaw cycle, it was observed that formulation passed the heating cooling cycle test, hence further exposed to centrifugation test then it was taken for freeze thaw stress test. After freeze thaw stress test it was found that all three formulations showed good stability with no phase separation, creaming or cracking were showed in Table 4.

Rheological study

The rheological properties of the prepared formulations were evaluated by Brookfield viscometer. This viscosities determination confirm the system is o/w or w/o. If system has low viscosity then it is o/w and high viscosity then w/o. Viscosity of prepared batches was determined by diluting 1 ml sample of each batch with 10 ml and 100 ml of distilled water by using Brookfield viscometer. The obtained results were showed in Table 5.

Globule size and zeta potential determination

The globule size of the emulsion is a crucial factor of self nano-emulsification performance because it deter-

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

mines the rate and extends of drug release as well as drug absorption. Also, smaller particle size of the emulsion droplets may lead to more rapid absorption and improve the bioavailability.

The globule size and zeta potential determined using Nanoparticle analyzer sz-100. The average globule size was taken into consideration. Table 6 shows the particle size, zeta potential and PDI of formulated batches of garlic oil SNEDDS diluted with water. The average particle size obtained from optimized batch Garlic F2 of SNEDDS formulation of garlic oil was found to be 177.2 nm, zeta potential -25 mv and polydispersity index was found to be 0.386 Figure 7 and 8. Zeta potential is the another property that was assessed for increased absorption of SNEDDS is the charge of oil droplets which is usually found to be negative due to the presence of free fatty acid. These results indicate that the optimal garlic oil SNEDDS formulation produced clear nano emulsion with nanometric size.

Dispersibility test (Assessment of Self Emulsification)

Emulsification time is a major parameter that helps in the determination of emulsification rate of SNEDDS. Oil is a major factor that affect relatively because when it present in high concentration, it prevent penetration of water. While hydrophilic compound such as surfactant and co-surfactant helps in dispersion and so enhance the emulsification rate. The efficiency of self- emulsification could be estimated primarily by determining the rate of oil droplets of SNEDDS formulation dispersed quickly and completely when subjected to aqueous dilution under agitation. The self- emulsification time of prepared formulation of SNEDDS were show in Table 7.

Percent transmittance

The results of % transmittance were shown in Table 8. The clarity of prepared nano emulsion was checked by transparency, measured in terms of transmittance. SNEDDS forms o/w nano emulsion since water is external phase. Formulation Garlic F2 has 97.50 % transmittance. The result indicates good clarity of emulsion Table 8.

Cloud point determination Cloud point of prepared nanoemulsion was found to be higher than 80°C, which indicate that nanoemulsion will be stable at physiological temperature without risk of phase separation. The obtained results were showed in Table 9.

Drug content The drug content of the prepared formulations was shown in Table 10.

CONCLUSION

In this study, liquid SNEDDS was formulated by using capryol PGMC as surfactant. From this study, it was concluded that the prepared liquid SNEDDS was thermo dynamically stable with good self-emulsification efficiency, improved dissolution rate and having globule size in the nanometric range which may be physiologically stable. The SNEDDS with relatively high drug content was prepared which self-emulsified easily with mean emulsion droplet size of 177.2 nm. Thermodynamic stability study and cloud point study confirmed that the SNEDDS had no dilution effect and was stable without any precipitation of drug and without any change in emulsion droplet size.

ACKNOWLEDGEMENT

The authors are thankful to Ashokrao Mane College of Pharmacy management for providing facility to carry out research work, also thankful to Sanket Enterprises, Mumbai for providing Garlic Oil and Gatteffosse Mumbai for providing Capryol PGMC as gift sample.

CONFLICT OF INTEREST

The authors declare no conflict of interest.

PICTORIAL ABSTRACT

Problems associate with Garlic oil:
Volatility, Strong odour, Insolubility in water, Low physicochemical stability

SUMMARY

In this present work, liquid SNEDDS of garlic oil was formulated by using capryol PGMC as surfactant. From this study, it was observed that the prepared liquid SNEDDS of garlic oil was thermodynamically stable with good self-emulsification efficiency, improved dissolution rate and having globule size in the nanometric range which may be physiologically stable. The garlic oil shows better solubility in oleic acid (oil), capryol PGMC (surfactant) and ethanol (co-surfactant) which was find out by constructing pseudo-ternary phase diagram. The Km=3 was selected for the preparation of SNEDDS of garlic oil because it shows better nanoemulsion region as compared to Km=1 and 2. The SNEDDS with relatively high drug content was prepared with mean emulsion droplet size of 177.2 nm. Thermodynamic stability study and cloud point study confirmed that the SNEDDS had no dilution effect and was stable without any precipitation of drug and without any change in emulsion droplet size.

About Authors

In silico study for the prediction of multiple pharmacological activities of novel hydrazone derivatives

Sachin H Rohane* & Ashlesha G Makwana

Department of Chemistry, K. B. Institute of Pharmaceutical Education and Research, Gandhinagar 382 023, India

E-mail : sachinrohane29@gmail.com

Received 11 May 2018; accepted (revised) 10 January 2019

The present studies are aimed to predict multiple pharmacological activities of novel hydrazone derivatives. Molecular docking of compounds 1 to 51 have been performed in Small-Molecule Drug Discovery Suite of Schrödinger. Fifty one compounds have been targeted on seven enzymes *viz*. 2NSD and 2X22 involved in tuberculosis activity, 4COX and 3LN1 involved in inflammation, 4GCP and 4HL2 involved in bacterial infection and 4WMZ involved in fungal infection. The generated lower energy conformers of all ligands have been docked into generated grid of active site of enzymes by XP precision of docking inside Glide-v7.4. Molecular docking results suggest that the compounds 4, 5, 11, 18, 30, 34, 35, 37, 38, 42, 43, 44, 45, 46 and 47 have good docking score and are predicted to interact with all enzymes. In all fifteen novel hydrazone derivatives have been predicted for multiple pharmacological activities.

Keywords: Hydrazone, molecular docking, multiple pharmacological activities

In hydrazone, the nitrogen is attached to hydrogen; these hydrazone are stable enough for isolation. However, in some cases, especially with simple R group, they rapidly decompose or polymerize unless there is at least one aryl group on nitrogen or the carbon. When there is an aryl group the compound are quite stable and these compound called Schiff bases and the reaction is the best way to prepare them. The reaction is straightforward and proceeds in high yield[1].

Hydrazones with an azomethine −NHN=CH− proton constitute an important class of compounds for new drug development. Therefore, many researchers have synthesized these compounds as target structures and evaluated their biological activities. These observations have been promoting and guiding the development of new hydrazones that possess multiple biological activities. Hopefully, this will allow the development of innovative new strategies for the development of novel compounds with different schemes, methods and materials[2].

The chemistry of these derivatives has been a fascinating field of investigation in medicinal chemistry. They have been found to exhibit enhanced biological profile. Hydrazones are known to exhibit a wide variety of biological activities. They are used as antibacterial agents, anti-tubercular agents, analgesics, anti-inflammatory agents, antiviral agents, antifungal agents, muscle relaxants and antihistamines, *etc*.[3]

The docking is a computational method to study the formation of intermolecular complexes and is a subject of intensive research. Drug exerts its biological activity by binding to the pocket of receptor molecule. In their binding conformations, the molecules exhibit geometric and chemical complementarily, both of which are essential for successful drug activity. The computational process of searching for a ligand that is able to fit both geometrically and energetically into the binding site of a protein is called molecular docking.

Molecular docking helps in studying drug/ ligand or receptor/ protein interactions by identifying the suitable active sites in protein, obtaining the best geometry of ligand - receptor complex and calculating the energy of interaction for different ligands to design more effective ligands. The target or receptor is either experimentally known or theoretically generated through knowledge based protein modeling or homology modeling. The molecular docking tool has been developed to obtain a preferred geometry of interaction of ligand - receptor complexes having minimum interaction energy based on different scoring functions. This utility allows one to screen a set of compounds for lead optimization or synthesis[4,5].

Experimental Section

Molecular docking of 1 to 51 compounds was performed in Small-Molecule Drug Discovery Suite of Schrödinger. Fifty one compounds were targeted on 7 enzymes such as 2NSD and 2X22[13] involved in tuberculosis activity, 4COX[8,9] and 3LN1[6,7,10] involved in inflammation[11,12], 4GCP and 4HL2 involved in bacterial infection and 4WMZ involved in fungal infection. The generated lower energy conformers of all ligands were docked into generated grid of active site of enzymes by XP precision of docking inside Glide-v7.4.

Preparation of small molecule: A set of new 51 hydrazone derivatives (Table I) were compiled by us using ChemDraw. 3D structures which were constructed using Chem 3D ultra 12.0 software [Molecular Modeling and Analysis; Cambridge Soft Corporation, USA (2010)], and saved as MDL Mol File (* .mol).

Ligand preparation

The structure of each compound was cleaned and optimized using Ligprep. The clean-up and optimization process include conversion of structures from 2D to 3D, addition of hydrogen atoms, generation of possible ionization state at *p*H 7.0, generation of tautomers (if any), generation of all combinations of stereoisomers, and energy minimization. The low energy conformer of ligands was generated using OPLS3 force field. All structures were saved in 'maestro' output format.

Protein preparation

The protein such as 2NSD, 2X22, 4COX, 3LN1, 4GCP, 4HL2 and 4WMZ download from protein data bank. All protein structures were prepared for docking using the ‘‘protein preparation wizard’’ in Maestro-v11.1. The protein preparation was carried out in two steps, preparation and refinement. Preparation steps involved assigning of bond order, addition hydrogen, removal of original hydrogen, creation of zero order bonds to metals, and filling of missing side chain an d loops using prime. All water molecules in the crystal structures were deleted, het states of bound ligands were generated using Epik at *p*H 7.0 and termini were capped by adding ACE and NMA residue. The refinement steps involved the optimization of hydrogen bonding network was by reorienting hydroxyl groups, and amide groups of Asn and Gln, and selecting appropriate states and orientations of the imidazole ring in His residues. The refinement steps also include a restrained impact minimization of the co-crystallized complex. It uses the OPLS3 force field for this purpose.

Grid Generation

Grid files represent the active sites of enzyme that are searched when attempting to dock a ligand. It was generated by Receptor Grid Generation panel of Glide-v7.4. Grids were defined by centering on the co-crystallized ligand in the crystal structure. It excludes co-crystallized ligand and thus determines the position and size of the active site. The size of grid box was fixed so that ligand with size of </= 20 Å can be docked. The van der Waals radius scaling factor of 0.7 for atoms with a partial atomic charge (absolute value) less than 0.25 was used to soften the potential for nonpolar parts of the receptor. The constraints were also defined as per various interactions visualized in PDB of co-crystallized ligands with respective enzyme. The rotatable groups like hydroxyl and thiol groups in enzymes were allowed to rotate.

Docking calculations

The generated lower energy conformers of all ligands were docked into generated grid of active site of enzymes by XP precision of docking inside Glide-v7.4. The ligand sampling was set up to be flexible which allow the sampling of ring conformation, nitrogen inversion and penalize the non planar conformation of amide groups. Some more settings were set like adding of epic state penalties to docking score, rewarding intramolecular hydrogen bonds, and enhancement of planarity of conjugated pi-groups. The constraints were selected as set in grid generation, must be satisfied for at least 1 interaction. All other advanced settings were set as defaults given in software.

Results and Discussion

The docking study was performed using Small-Molecule Drug Discovery Suite of Schrödinger Glide-v7.4. All novel hydrazone derivatives were docked into the active site of seven enzymes such as enoyl acyl carrier protein reductase inhA (PDB ID: 2NSD), *M. tuberculosis* inhA (PDB ID: 2X22), COX-2 (PDB ID: 4COX), COX-2 (PDB ID: 3LN1), *E. coli* OmpF porin (PDB ID: 4GCP), New delhi metallo-beta-lactamase-11.05 A (PDB ID: 4HL2) and *S. cerevisiae* CYP51 (PDB ID: 4WMZ) which showed better docking scores than the reference compounds (Table II). There are fifteen compounds which showed a fit interaction with enzymes (Figures 1-14) and predicted for multiple pharmacological activities (Table III).

Conclusion

Molecular docking has gaining consideration as an important tool for drug discovery. The molecular docking studies help in understanding the various interactions between the ligands and enzyme active sites in detail and thereby help to design novel hydrazones. The docking experiments were carried out for all the fiftyone compounds on seven enzymes and compared the docking score with reference compounds. The compounds 4, 5, 11, 18, 30, 34, 35, 37, 38, 42, 43, 44, 45, 46 and 47 showed higher binding score. These compounds are predicted for multiple pharmacological activities such as antitubercular, anti-inflammatory, antibacterial and antifungal.

ABSTRACT:
The aim of present work was to extract, modify and characterize tamarind gum (TG), and explore its pharmaceutical applications. TG was extracted from tamarind kernel powder and tamarind seeds, and modified to carboxymethyl tamarind gum (CMTG) by using monochloroacetic acid. TG and CMTG were evaluated for pH, solubility, viscosity, swelling and powder characteristics, and characterized by Attenuated total reflectance-Fourier transform infrared (ATR-FTIR) spectroscopy, solid state ^{13}C-nuclear magnetic resonance (^{13}C-NMR) spectroscopy, differential scanning calorimeter (DSC) and X-ray diffractometer. TG was successfully extracted with yield more than 50%. Extracted gum was free from impurities like proteins and fats. Carboxymethylation of TG was confirmed by ATR-FTIR, solid state ^{13}C-NMR and DSC study. The result of XRD study indicates that the amorphous nature of CMTG. Functionalization of TG into carboxymethyl derivative improved physicochemical properties of TG. CMTG showed high solubility, viscosity and swelling than TG. Results of the study revealed that carboxymethyl derivative can be potentially used for development of various drug delivery systems. It can be concluded that the CMTG has great potential as an excipient in pharmaceutical industry.

KEYWORDS: Extraction, Characterization, Tamarind gum, Carboxymethyl tamarind gum, Functionalization of tamarind gum.

1. INTRODUCTION:
The attention towards polysaccharides of natural origin is constantly rising during the past decade. The natural polysaccharides are widely used in the field of food technology, cosmetics, pharmaceuticals and biomedical sciences. Exploitation of new sources of polysaccharides of different origin is well documented in the literature[1]. They exhibit good mechanical properties and are widely used as fibers, films, adhesives, rheology modifiers, hydrogels, emulsifiers and drug delivery agents. Sodium alginate (SA), xanthan gum (XG), guar gum, scleroglucan, and locust bean gums are some of the natural polysaccharides which are fueling the interest of the researchers dealing with the development of drug delivery systems[2].

The functional groups of polysaccharides have been explored for chemical modification to change their properties like solubility, swelling, viscosity, and degradation[3].

Tamarind seed contains approximately 65% of the gum and it may be used for the development of specific drug delivery systems. The polysaccharide that is present in tamarind gum (TG) is known as tamarind seed polysaccharide[4]. Functionalization of gum into Carboxymethyl tamarind gum (CMTG) may improve physicochemical properties of tamarind gum. Despite being well suited for pharmaceutical application, TG exhibits some potential drawbacks. TG has a dull color and unpleasant odor. Its insolubility in water and degradation in aqueous environment has forced the scientists to chemically modify its functional groups[5]. Various modifications which have been executed till date include carboxymethylation[6], acetylation[7], hydroxyl-alkylation[8] and thiolisation[9,10]. Such

6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

modifications have caused alteration in the solubility, viscosity, swelling, and stability of tamarind gum. TG and CMTG has been used in the development of various drug delivery systems[11–16]. Considering above facts there is demand to explore physicochemical properties of TG in order to ensure its suitability as an excipient in development of drug delivery systems. Hence, an attempt was made to extract, modify and characterize tamarind gum.

2. MATERIALS AND METHODS:

Tamarind kernel powder was kindly gifted by Chhaya Industries, Barshi, Maharashtra (India). Tamarind seeds were purchased from local market. All other chemicals and solvents were supplied by Loba Chemie, Mumbai, Maharashtra (India).

2.1 Extraction of TG:

TG was extracted from the tamarind kernel powder available in the market. The 20 g of defatted tamarind seed powder was added to 200 ml of cold distilled water to prepare slurry. Slurry was then poured into 800ml of boiling distilled water containing citric acid (0.2 %). The solution was boiled for 20 min with stirring in a water bath. Resulting thin clear solution was kept overnight (24 h) so that most of the proteins and fibers settle out, following which the solution was centrifuged at 5000 rpm for 20 min. Supernatant liquid was separated and poured into the excess of absolute alcohol with continuous stirring (1:1). Precipitate was washed with 200 ml of absolute ethanol, diethyl ether, and petroleum ether and/or acetone and dried at 50-60°C for 10 h. Dried polymer was powdered, sieved and stored in a desiccator until further use[17,18]. Also, TG was extracted using tamarind seeds. Percent yield was calculated and recorded. Flow chart of TG extraction is given in Figure 1.

2.2 Characterization of TG:

Organoleptic evaluation of TG:

Separated gum was evaluated for color, odor, taste, fracture, and texture. TG was cream brown in color, odorless and tasteless with irregular in shape. TG was rough in touch, texture, and fracture.

Shape of TG particles:

TG particles were observed under the Motic microscope at 10X resolution.

Identification tests:

Identification tests for TG were performed as per the standard procedures.

Determination of solubility:

A 100 ml (1% w/v) suspension of polysaccharide was transferred into a blender jar and blended at low speed for 3 min. The suspension was transferred to a centrifuge tube and centrifuged for 15 min. A 50 ml aliquot of supernatant was taken into a pre-weighed petri plate and dried in hot air oven at 105°C until the constant weight was obtained. Percent cold water solubility was then calculated and recorded[19].

Determination of PH:

A weighed quantity of TG was dispersed in distilled water to get 1% w/v solution. The pH of the resultant solution was measured by using pH meter.

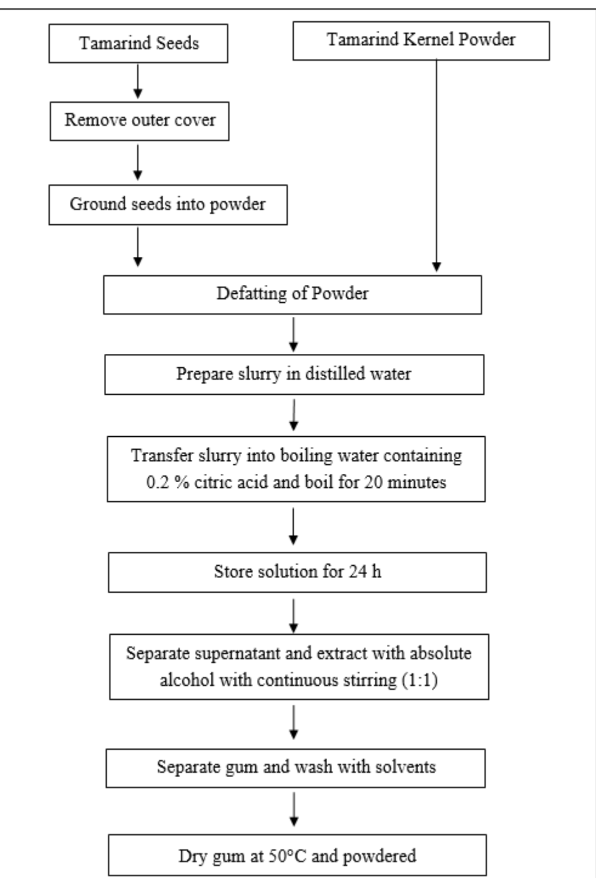

Figure 1: Extraction of TG.

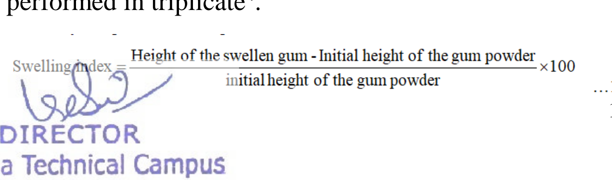
Swelling index of TG:

Swelling profile of TG was determined by transferring accurately weighed 1 gm of TG into separate 25 ml measuring cylinders. The volume of each of cylinder was adjusted with solvent and observations were recorded for an increase in the volume of TG. Readings were taken at specified times until a constant volume was observed in each of the cylinders. The study was performed in triplicate[4].



$$\text{Swelling index} = \frac{\text{Height of the swellen gum - Initial height of the gum powder}}{\text{initial height of the gum powder}} \times 100 \quad \ldots 1$$

1

DIRECTOR
Yashoda Technical Campus
Satara

Determination of viscosity:

Accurately weighed (1 gm) required quantity of TG was transferred to into separate 100 ml volumetric flask. These were made up to mark with distilled water. After one hour viscosity was measured. Small sample adapter (7ml) was used for measurement of viscosity with Spindle No. 21 rotated at 100 RPM. The study was performed in triplicate.

Bulk and tap density:

Accurately weighed 100 gm TG transferred into 250 ml graduated measuring cylinder and the initial volume of powder was recorded as V_0. The powder was subjected to 300 taps/min in tap density apparatus (Electrolab, Mumbai). The tapped volume was recorded as V_f. Bulk and tap density of TG were calculated using the following equations:

$$\text{Bulk density} = \frac{\text{Weignt of powder } (W)}{\text{Initial volume of powder } (V_0)} \quad (2)$$

$$\text{Tap density} = \frac{\text{Weignt of powder } (W)}{\text{Tap volume of powder } (V_f)} \quad (3)$$

***Carr's Index and Hausner's ratio*:**

Carr's index and Hausner's ratio are measures of the relative importance of interparticulate interactions. The Carr's index gives an idea about flowability of the powder. Carr's index can be calculated using the following equation:

$$\text{Carr's Index} = \frac{\text{Tapped density - Bulk density}}{\text{Tapped density}} \quad (4)$$

Hausner's ratio was calculated using the equation below:

$$\text{Hausner's ratio} = \frac{\text{Bulk density}}{\text{Tapped density}} \quad (5)$$

ATR-FTIR study of TG:

Infrared spectrum of was obtained using ATR-FTIR spectrophotometer (Shimadzu, Miracle 10, IR Affinity, Japan). The samples to be analyzed were placed onto the ATR and spectra were recorded in the range of 600–4000 cm^{-1} at an average of 25 scans and resolution of 4 cm^{-1}.

Thermal analysis of TG:

Thermogravimetric analysis (TGA) and differential scanning calorimetry (DSC) of TG was performed using Mettler-Toledo TGA/DSC1 thermogravimetric analyzer (Mettler-Toledo, Switzerland). Samples were heated from 30ºC–300ºC at the rate of 10ºC/min, under a nitrogen atmosphere (flow rate: 10 ml/min).

Solid state ^{13}C NMR spectroscopy:

Solid state ^{13}C cross-polarization-magic angle spinning (^{13}C CP-MAS) NMR spectrum of TG was measured using JEOL-ECX400 spectrometer operating at 400 MHz (contact time of 3.5 ms, a relaxation delay of 5s, sweep width of 35 kHz and spinning speed of 10KHz). The chemical shifts were calibrated with the external hexamethylbenzene standard methyl resonance at 17.3 ppm.

X-ray powder diffraction:

X-ray diffraction (XRD) patterns of TG and CMTG were recorded using X-ray diffractometer (PW1729, Philips, The Netherlands) with a copper target, operated at voltage of 30 kV, 30 mA current, at 2°C/min scanning speed and scanning angle ranging from 0 to 90° (2θ).

2.3 Synthesis of CMTG:

Carboxymethylation of TG was carried out using the method reported by Goyal et al., 2007[20] (see Figure 2). TG (0.05 mol) was dispersed in 80ml alkaline aqueous methanol (0.158 mol sodium hydroxide). To this dispersion monochloroacetic acid (0.09 mol) was added in solid form with continuous stirring for 15 min. The flask was immersed in a thermostatic water bath and the temperature was maintained at 70°C for 60 min. The contents of the flask were shaken occasionally during the course of the study. The reaction product was filtered, dissolved in water and neutralized with dilute acetic acid. The reaction product was precipitated in ethanol and washed twice with aqueous methanol (80 %, v/v) followed by pure methanol. The product was initially dried at room temperature and then in a vacuum oven at 40°C for 4 h to obtain CMTG. The degree of substitution of CMTG was determined by titrimetric method[9,21].

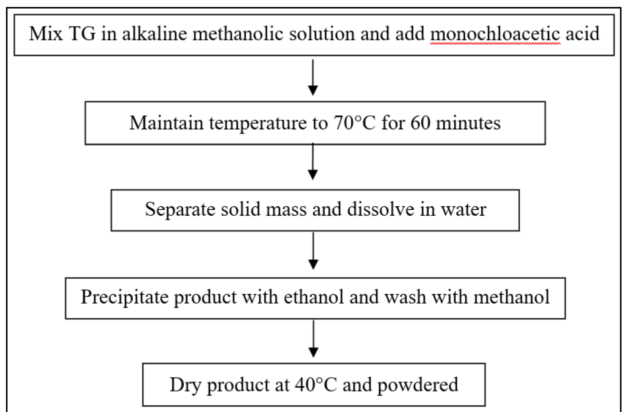


Figure 2: Synthesis of CMTG.

2.4 Characterization of CMTG:

Organoleptic properties, Shape of particles, identification tests, solubility, pH, swelling index, viscosity and powder characteristics of CMTG was as per procedure given in evaluation of TG. Further carboxymethylation of TG was confirmed by ATR-FTIR, thermal analysis and solid-state ^{13}C NMR of CMTG.

3. RESULTS AND DISCUSSION:

3.1 Extraction of TG:

Results of extraction of TG are given in Table 1. Initially, TG was extracted from the tamarind seeds. The process to collect gum from tamarind seed was tedious, time-consuming and yield was also very low (less than 20%)[4]. This might be due to wastage of gum during extraction. Tamarind kernel powder is available in the market which contains fats, proteins, and carbohydrate. Fats present in tamarind kernel powder were removed with petroleum ether and was further used for extraction of TG. Tamarind kernel powder was added to boiling an aqueous solution of citric acid helps to separate proteins from the TG due to precipitation. TG present in the supernatant solution was separated by alcohol-precipitation[18]. The yield of TG was found to be more than 50% (~52.89±3.31%) when tamarind kernel powder was used for extraction. Obtained TG was passed through Sieve No 80 and stored in desiccator until further use.

Table 1: Extraction of TG

Parameter	Tamarind seeds	Tamarind kernel powder
Weight of Raw material (g)	20	20
Yield (g)	3.54	10.47
Yield (%)	17.69	52.89

3.2 Characterization of TG:

Organoleptic evaluation of TG:

Separated gum was evaluated for color, odor, taste, fracture, and texture. TG was cream brown in color, odorless and tasteless with irregular in shape. TG was rough in touch, texture and hard.

Shape of TG particles:

TG powder was observed under a Motic microscope at 10X resolution. Shape of particles is shown in Figure 3.

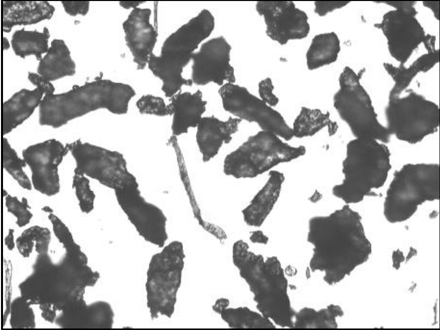

Figure 3: Microscopic image of TG.

TG particles were found to be irregular in shape with a rough surface. Most of the particles were of rectangular in shape. This may be due to the formation of thread-like structure during the extraction process.

Identification tests:

Results of identification tests are given in Table 2. Identification tests showed the presence of carbohydrate in the TG powder. When TG was mixed with Molisch's reagent followed by addition of sulfuric acid the violet color ring was appeared at the junction of the mixture in a test tube which confirms the presence of carbohydrate. TG powder showed negative test results for alkaloids, tannins, proteins, fats, and mucilages. This can be considered as proof for the purity of the isolated TG and free from proteins and fats.

Table 2: Chemical characterization of TG

Test	Present (+) /Absent (-)
Carbohydrate	+
Hexose sugar	+
Monosaccharides	-
Alkaloid	-
Tannins	-
Fats and oils	-
Proteins	-
Amino acids	-
Mucilages	-

Determination of solubility:

Cold water solubility of the TG sample was found to be 1.59±0.16 mg/ml. When the sample was heated it forms viscous solution due to swelling of TG in water. It indicates TG may form a gel. TG powder was found to be insoluble in ethanol, methanol, benzene, ether, and acetone.

Determination of pH:

pH of 1% TG in distilled water was found to be 6.52±0.18. It indicates that the TG is slightly acidic in nature.

Swelling of TG:

Swelling of TG was found to be 1.6 times of the dry volume of gum. It indicates TG can be used in sustained or controlled drug delivery of drugs.

Determination of viscosity:

Viscosity of 1 % TG was found to be 38.53±2.21 cP. It indicates a high concentration of TG is required to produce a gel.

Powder characteristics of TG:

Micromeritic properties of TG powder are given in Table 3. The flow properties of the powder material are dependent on the shape of the particles. It indicates that the prepared TG may be suitable for the development of solid dosage forms with the addition of suitable glidant.

Table 3: Micromeritic properties of TG

Parameter	Value
Bulk density (g/ml)	0.48
Tap density (g/ml)	0.57
Carr's Index (%)	15.8
Hausner's ratio	1.19
Angle of repose (°)	31.4

YASHODA TECHNICAL CAMPUS 6757 SATARA
DIRECTOR
Yashoda Technical Campus
Satara

ATR-FTIR study of TG:

ATR-FTIR spectrum of TG is given in Figure 4. ATR-FTIR spectrum of TG exhibited broad strong peaks at 3500–3000 cm^{-1} belonging to stretching vibration of –OH groups present in glucose, xylose and galactose units in the polysaccharide. A strong peak at 1039 cm^{-1} and 1143 cm^{-1} are attributed to the C-O stretching vibration of alcoholic group. The medium peak at 2920 cm^{-1} belonged to asymmetric stretching of CH. The peaks at 1747 cm^{-1} and 1689 cm^{-1} were due to carbonyl (-HC=O) stretching[22].

Thermal analysis of TG:

TGA-DSC of TG is given in Figure 5. Thermal decomposition curve of TG showed two main stages of decomposition. The first stage begins at 35°C and ends at 100°C. This may be due to the removal of free and bound water from the polymer. The second stage of weight loss was observed around 228°C to 300°C with 35% loss of weight. DSC thermogram of TG showed endotherm at 238.56°C. DSC curve supports the weight loss as evident in TGA curve.

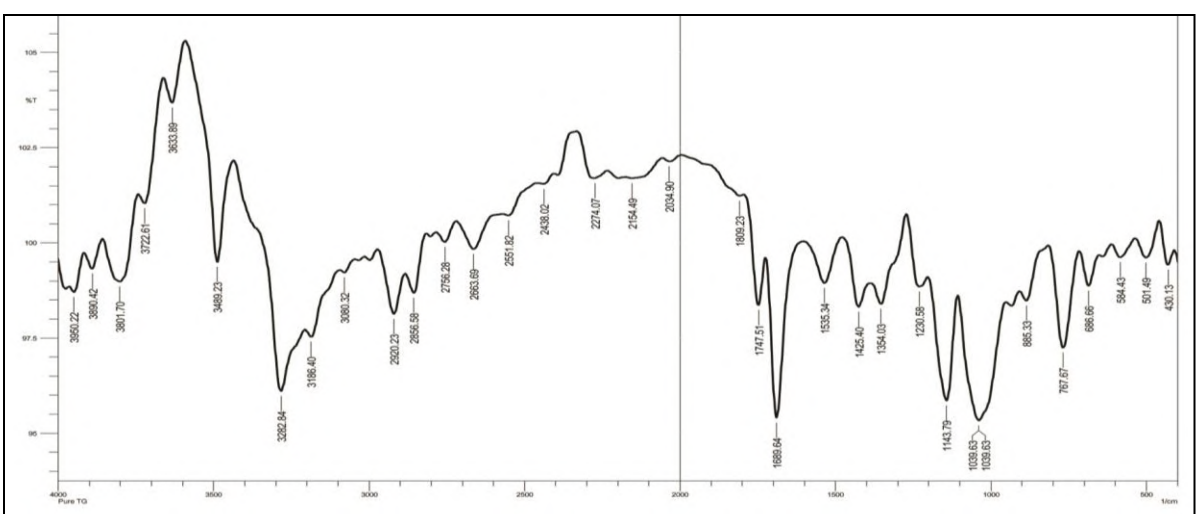

Figure 4: ATR-FTIR spectrum of TG.

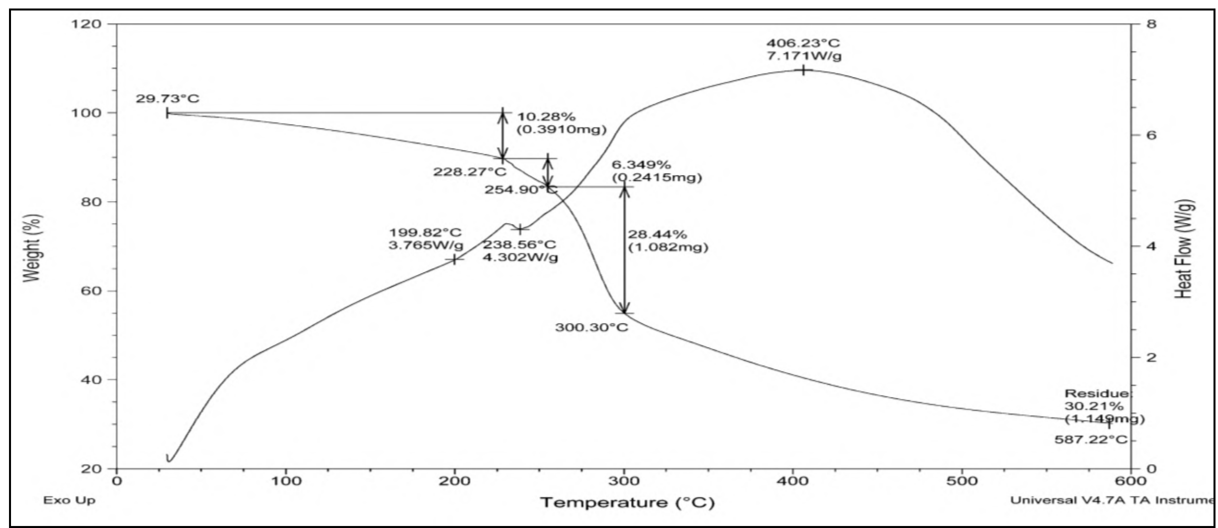

Figure 5: TGA-DSC of TG.

Solid state ^{13}C NMR spectroscopy:

Solid-state ^{13}C NMR spectrum of TG showed three distinct peaks (Figure 6). The resonance peak at 105ppm is assigned to an anomeric carbon atom (C1) and the peak at 74ppm is assigned to the carbon atoms (C2 to C5) connected by –OH groups (i.e., the carbon atoms in the six-membered ring except for C1 carbon atom). The presence of a peak at 63ppm is attributed to the C6 carbon atom of CH_2OH group.

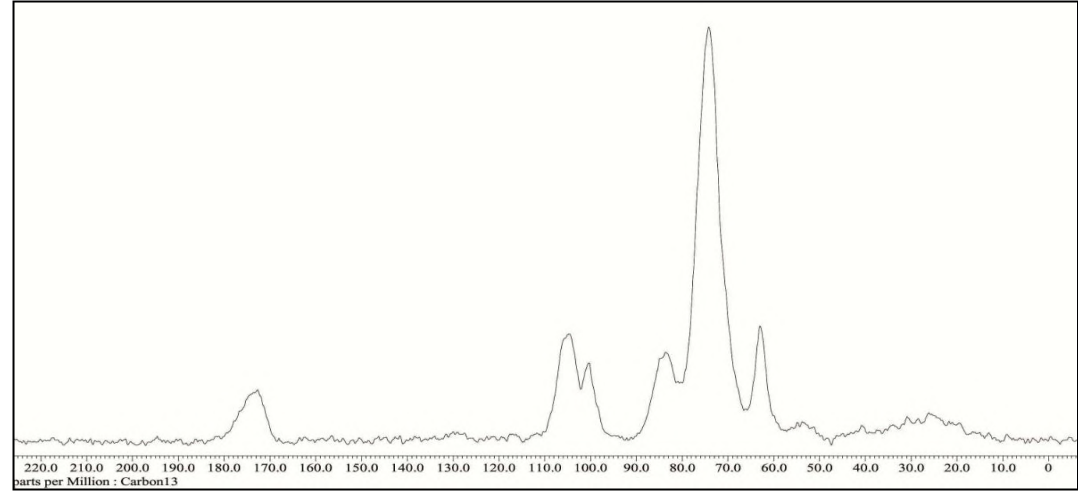

Figure 6: Solid state ^{13}C NMR of TG.

X-ray powder diffraction:

XRD of TG is given in Figure 7. TG did not show any characteristic peak, which indicates that the structure is completely amorphous.

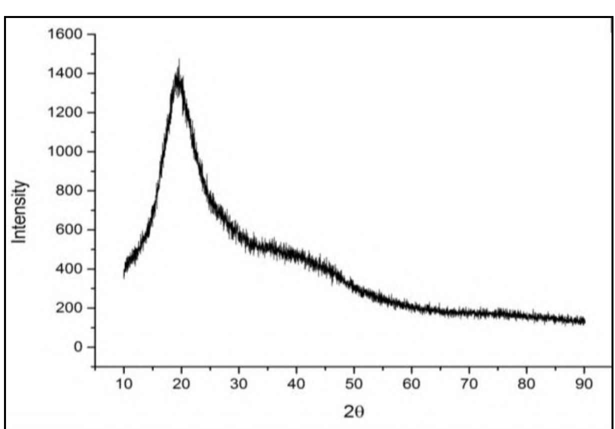

Figure 7: XRD of TG.

3.3 Synthesis of CMTG:

Addition of TG in a methanolic sodium hydroxide solution leads to the formation of TG-alkoxide. When this solution is heated in presence of monochloro acetic acid, a SN_2 reaction takes place in between TG-alkoxide and monochloro acetic acid resulting in the carboxymethylation of TG[20]. The carboxymethylation of TG was confirmed by the infrared spectroscopy. Batch size for carboxymethylation was 50 gm. The % yield of carboxymethyl TG was found to be 50.6±4.17 %. The degree of substitution was calculated using the titrimetric method and was found to be in the range of 0.16 to 0.2.

3.4 Characterization of CMTG:

Organoleptic evaluation of CMTG:

Sample of CMTG was evaluated for color, odor, taste, fracture, and texture. CMTG powder was light cream brown in color, odorless and tasteless with irregular in shape. CMTG was found to be rough in touch, texture, and fracture.

Shape of CMTG particles:

Microscopic image of CMTG is given in Figure 8. CMTG particles were found to be irregular in shape.

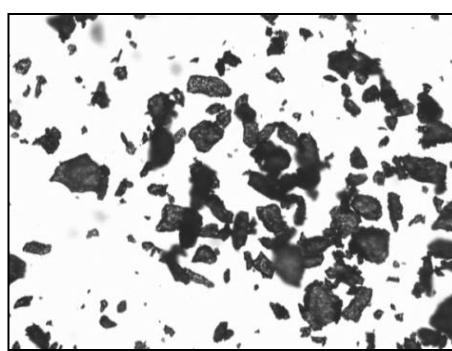

Figure 8: Microscopic image of CMTG particles.

Identification tests:

Test for carbohydrate was found to be positive and all other remaining tests were negative. It indicates synthesized CMTG was free from any other impurities.

Determination of solubility:

Cold water solubility of CMTG sample was found to be 10.53±1.28mg/ml. It indicates carboxymethylation of tamarind increases the solubility of tamarind gum. The sample of CMTG was found to be insoluble in ethanol, methanol, acetone, and benzene.

Determination of pH:

pH of 1% CMTG sample was found to be 5.94.

Swelling index of CMTG:

Swelling of CMTG was found to be two times of the dry volume of TG. It indicates CMTG can be used in sustained or controlled drug delivery of drugs.

DIRECTOR
Yashoda Technical Campus
Satara

Determination of viscosity:
Viscosity of 1% CMTG was found to be 167.66±2.5 cP. Carboxymethylation of tamarind gum increased the viscosity of tamarind gum indicated the suitability of tamarind gum as matrix former as well as release retardant in development of novel drug delivery systems.

Powder characteristics of CMTG:
Powder characteristics of CMTG are given in Table 4. Carboxymethylation of tamarind gum improved the compressibility and flow properties of tamarind gum. This might be due to change in particle properties of CMTG. It suggests the suitability of CMTG in the development of solid dosage forms like tablets.

Table 4: Micrometric properties of CMTG

Parameter	Value
Bulk density (g/ml)	0.79
Tap density (g/ml)	0.85
Angle of repose (°)	24.94
Carr's index (%)	7.05
Hausner's ratio	1.07

ATR-FTIR of CMTG:
The ATR-FTIR spectrum of CMTG is given in Figure 9. The spectrum of CMTG exhibited broad strong peaks in the range of 3500 –3000 cm^{-1} representing stretching vibration of –OH groups present in glucose, xylose and galactose units in the polysaccharide. The medium peaks at 2856 cm^{-1} and 2927 cm^{-1} indicated asymmetric stretching of CH. The existence of a peak at 1745.56 cm^{-1} ascribed to C=O of the ester group. The peaks at 1639 cm^{-1} and 1402 cm^{-1} revealed the presence of carboxyl groups in CMTG. The existence of a peak at 1010 cm^{-1} indicated C-O-C stretch of the glycosidic link of CMTG[23,24]. The carboxymethylation is confirmed by the appearance of characteristic C=O and –COO bands at 1745.58 cm^{-1} and 1402 cm^{-1} respectively.

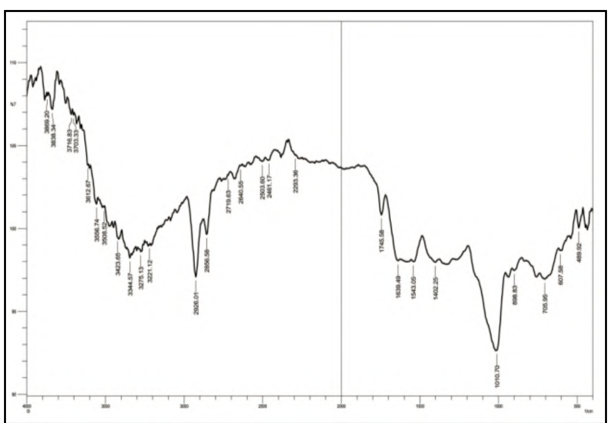

Figure 9: ATR-FTIR spectrum of CMTG.

DSC-TGA of CMTG:
DSC-TGA of CMTG is given Figure 10. Thermal decomposition curve of CMTG shows two main stages of decomposition. The first stage begins at 35°C and ends at 100°C with 3.91 % weight loss. This may be due to the removal of free and bound water from the polymer. The second stage of weight loss was observed between 235°C to 425°C with 54.42 % loss of weight. The total weight loss was found to be 90 % at 485°C. The weight loss of CMTG in the second stage is attributed to the decomposition of the polymer backbone. DSC curve supports the weight loss as evident in TGA curve.

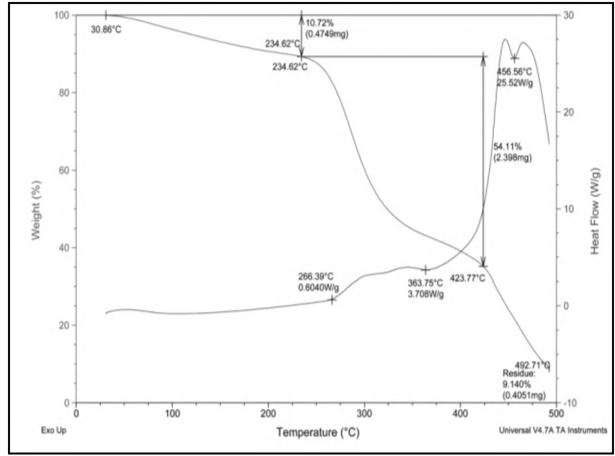

Figure 10: DSC-TGA of CMTG.

Solid state ^{13}C NMR of CMTG:
The solid-state ^{13}C NMR spectrum of CMTG shows three distinct peaks (Figure 11). The resonance peak at 105.2 ppm is assigned to the anomeric carbon atom (C1) and the peak at 74.28 ppm is assigned to the carbon atoms connected by –OH groups (i.e., the carbon atoms in the six-membered ring except for C1 carbon atom). The presence of a peak at 63.59 ppm corresponds to the C6 carbon atom of CH_2O- group. The signal at 173.32 ppm represents carbonyl carbon of CMTG. The solid-state ^{13}C NMR of hydrogel film shows all resonance peaks observed in CMTG[23].

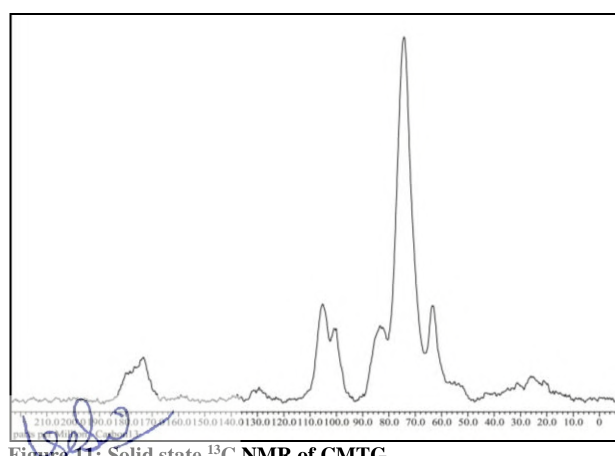

Figure 11: Solid state ^{13}C NMR of CMTG.

DIRECTOR
Yashoda Technical Campus
Satara

X-ray powder diffraction:

XRD of TG is given in Figure 12. CMTG did not show any characteristic peak, which indicates that the structure is completely amorphous.

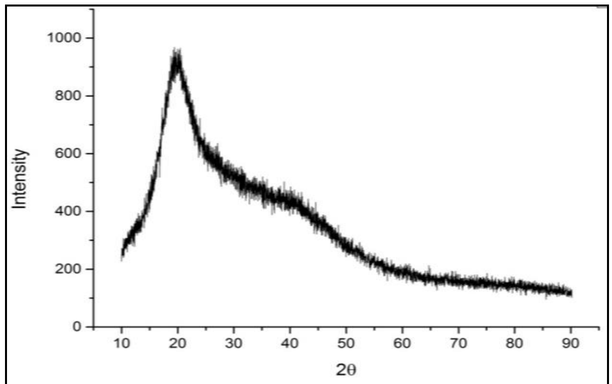

Figure 12: XRD of CMTG.

4. CONCLUSION:

Tamarind gum was successfully extracted with yield more than 50%. Extracted gum was free from impurities like proteins and fats. Physicochemical properties of tamarind gum indicate that it can be used as a pharmaceutical excipient in development of drug delivery. Functionalization of TG by carboxymethylation indicated improvement in physicochemical properties. Results of characterization revealed that carboxymethyl derivative can be potentially used for development of various drug delivery systems. It can be concluded that the TG and CMTG can be promising pharmaceutical excipients for the pharmaceutical industries.

Utilization of Press mud for Improvement of Strength of Interlocking Bricks

Mr. Shaikh. A. N.[1], Miss.Deshmukh P.S.[2], Mr. Shelar V.E.[3]

[1,2,3] Asst. Professor, Department of Civil Engineering, Dnyanshree Institute of Engineering and Technology,Sajjangad Satara, Maharashtra, India.

***

Abstract -Bricks are considered to be the most widely used and useful material of construction all over the world. In recent years, Interlocking brick has made significant advances which have resulted in economical improvements in strength of clay bricks. The economic development of nation depends upon the intelligent use of locally available materials. To overcome the use of natural resources and by attempting to use waste materials like waste Press-Mud and waste Fly ash in bricks could result in low cost construction. Waste Press mud is the byproduct of sugarcane factory which causes environmental problems because of its high production and less use. Sugar industries produce the huge amount of press mud and other waste materials. The production of press mud is significantly increased, due to increasing of the production of sugar and increasing the generation of new sugar factories also the use of waste press mud in manufacturing of interlocking bricks could help to avoid the problems related to environment pollution. An attempt has been made in this study to determine the maximum compressive strength of interlocking brick by using press mud consisting of sugarcane waste as partial replacement for fine aggregates (Grit). By using press mud, we can reduce the self-weight of brick. Interlocking bricks are used for easy construction of mortar less masonry and better appearance.

Key Words: Sugarcane Waste, Press Mud, Interlocking Brick, Mortar, Fly Ash, Grit.

1. INTRODUCTION

There is a strong demand for environmentally safe reuse and effective disposal method sugarcane press mud due to the increasing amount of sludge generated by various industries and plants in India. Landfills are commonly used for disposal of sludge in India, rapid urbanization has made it increasingly difficult to find suitable landfill sites. Therefore, incineration has become one of the few alternatives available for disposal of sugarcane press mud. The ultimate disposal of incinerated press mud can be accomplished by using it as engineering construction material. One possible solution for the management of this sugarcane press mud is to re-use it as a building material, namely, to incorporate this sugarcane waste press mud into interlocking bricks. The cement interlocking brick is a one of the most useful masonry building materials. The recycling of waste materials by incorporating them into interlocking bricks has been a popular topic of investigation over the last century, with varying degrees of success across a wide range of waste material of sugarcane press mud. This popularity is likely due to flexibility on the type of wastes which can be mixed into the brick making material, but more importantly, the high temperature involved in firing the bricks allows for the volatilization of dangerous Component, as well as the fixation of wastes into the vitreous phase of the brick. The current study investigates the potential for reusing sugarcane press mud by using it as a partial replacement of material [1].

1.1 What is Sugarcane Press Mud?

India is the second largest producer of the sugar in the world, with an annual output of 25 million tonnes. Among the steps leading to the production of refined sugar is the separation of sugarcane juice from the associated particulates. Upon this separation a solid residue is obtained which is called the press mud. In a typical sugar factory, the processing of 100 tonnes of sugarcane produces about 3 tonnes of press mud. In Maharashtra some sugar factory's 8–10 million tonnes of press mud are generated annually [2].

1.2 COMPOSITION OF PRESS MUD:

Press mud from the sugar industries is a very useful source of fertilizer as well as some substances. The major use that has recently been developed in India is in bio composting (usually trade named as Bio earth) where it is treated with the spent wash from the distillery. The composition of press mud is given in Table-1. Its usefulness as fertilizer is based on the nutrient content of the press mud and the spent wash as shown below: [2].

Table -1: Composition of press mud.

Sr. No.	Composition	(%)
1	Crude wax	5-14
2	Fiber	15-30
3	Crude protein	5-15
4	SiO	4-10
5	CaO	1-4
6	PO	1-3
7	MgO	0.5-1.5
8	Total ash	9-10

Table -2: Nutrientcontentsof press mud.

Composition	Press mud	Spent wash (mg/l)
Nitrogen	1.15 – 3.0	2630
Phosphorus	0.60 – 3.50	201
Potassium	0.30 – 1.80	222

1.3 GENERATION OF PRESS MUD:

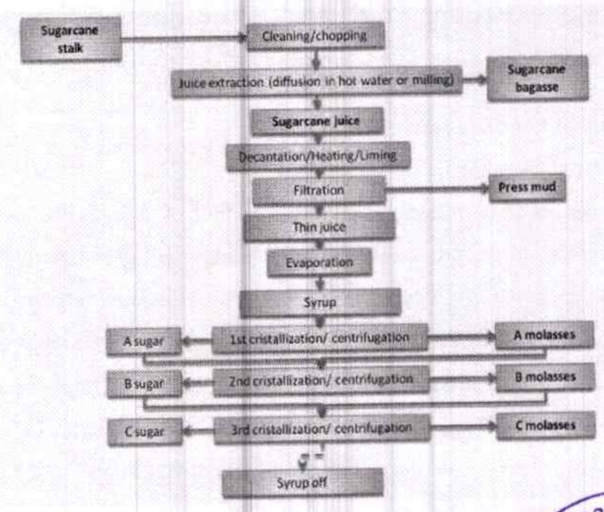

Fig -1: Generation of press mud.

2. LITERATURE REVIEW:

The waste from the industries is very harmful for the environment and also to our health, if not disposed in proper manner. The solid residue of sugarcane after crushing, extraction of its juice and before crystallization of s ugar.is known as “press mud”. India is one of the largest agriculture residues in the world [2]. The one way to dispose this waste is its use as fertilizer. But this is suitable for particular crops only. So, farmers avoid using it. The use of Sugarcane waste in brick can save the sugarcane industry disposal costs and produce an ecofriendly brick for construction. Sugarcane crop cultivation in India forms an important part of the Indian agricultural economy. The press mud can be used to recover protein, sugar and wax from press mud.

3. METHODOLOGY:

For the analysis purpose various interlocking brick samples are casted as per mix design with different percentage of sugarcane press mud and. the whole analysis is done in eight step which is given below.

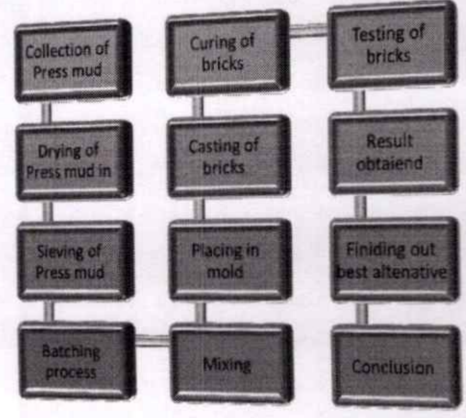

Chart -1: Process chart

3.1 COLLECTION OF PRESS MUD FROM FACTORY SITE:

Fig -2: Collection of press mud

3.2 DRYING OF PRESS MUD IN SUN:

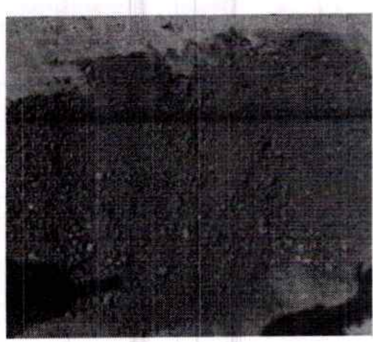

Fig -3: Drying of press mud

3.3 CASTING OF BRICKS:

Fig -4: Casting of bricks

3.4 CURING OF BRICKS:

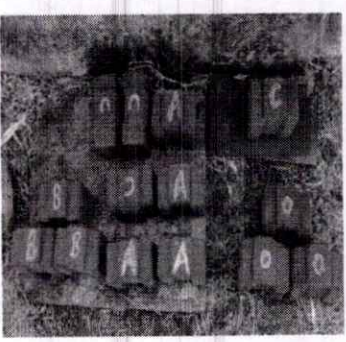

Fig -5: Placed for Curing

4. TEST ON BRICKS:

4.1. SHAPE AND SIZE TEST:

In this test, a brick specimen is closely inspected. It should be of standard size and its shape should be correctly rectangular with sharp edges. For this test, 3 bricks are selected at random and they are stacked length wise, along the width and along the height.

Results observed are:

1. One brick has not proper sharp edge.
2. Shape of brick slightly change due to breaking of edges.

4.2 WATER ABSORPTION TEST:

A brick is taken and it is weighted when it is dry. It is then immersed in water for a period of 24 hours. The brick is weighed again. The difference in weight indicates the amount of water absorbed by the brick. It should not exceed 20 percent of weight of dry brick.

Table -3: Water Absorption Test Result

Sr. No.	Block Name	Water absorption (%)
1	O	17.50 %
2	A	20.50 %
3	B	22.83 %
4	C	26.00 %

4.2 COMPRESSIVE STRENGTH TEST:

In this test the brick specimens are immersed in water for 24 hours. The specimen O, A, B, C is placed in compression testing machine. Then the load is applied axially at a uniform rate of 10 N/mm^2.The load and strength are noted accordingly.

Table -4: Compressive Strength Test Result

Sr. No.	Block Name	Compressive strength N/mm^2
1	O	3.54
2	A	4.16
3	B	3.75
4	C	2.93

Principal
RWMCT's Dnyanshree Institute of
Engineering & Technology,Sajjangad,Satara

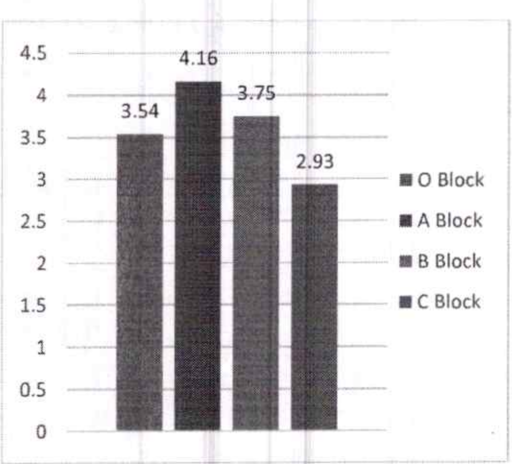

Chart No.2: Comparison of Compressive Strength Result N/mm^2 (28 Days)

5. CONCLUSIONS

Based on the above experimental procedure and test, we conclude as:

1. Use of sugarcane press mud in brick has solved the disposal problem; reduced cost and produced Eco- friendly brick for construction.
2. Reduction of weight of interlocking brick up to 20 % of weight of brick. As compere to normal interlocking bricks the bricks are light weight bricks.
3. In the Compressive strength result observed that block A is Shows moderately effect in increasing strength as compared to conventional brick i.e. greater than 3.5 N/mm^2.
